CD ROMs: Cleaning Your Discs (7/93)

==========

Article Created: 20 July 1993

TOPIC ----------

If there are fingerprints on the CD for my CD-ROM drive, will this impact the performance and if so, how can I clean them?

DISCUSSION ----------

Cleaning Computer CD ROM disks is no different from cleaning Audio CDs. You should only use a soft lint-free cloth and wipe from the center of the CD straight out (not in a circular motion around the disk). Fingerprints can interfere with the drive's ability to read the disk.

Performa 450: Converting DOS Files to WP Works (7/93)

==========

Article Created: 20 July 1993

TOPIC ----------

I have a Performa 450 with WordPerfect Works and PC Exchange already installed. I have been trying unsuccessfully to convert a DOS Word file (.DOT) into WordPerfect Works. Can I convert this file?

DISCUSSION ----------

WordPerfect Works can only work with a limited number of MS-DOS files. The .DOT file is probably not one of them.

Here are some suggestions for you to try:

- Try loading it back into the DOS application and trying to save as Text Only, Microsoft Word, WordPerfect, or any other common file format.

- Ask your local dealer about products that work in conjunction with PC Exchange and actually translate documents into various types of Macintosh files. Some of them have several different translators that your WordPerfect Works application does not have.

Performa: Deleting Items from the Directory (7/93)

==========

Article Created: 19 July 1993

TOPIC -----

How do I delete items from the directory on my Performa 450? I dragged them to the Trash and emptied the Trash, but they keep showing up.

DISCUSSION -----

Depending on where they show up, this may be normal. If you use At Ease, going to the Finder to delete an item will not delete it from At Ease. If you go back into At Ease, the icon for the item is still on one of the panels. However, if you click on the icon, a dialog box appears explaining that the original item couldn’t be found. The item will be removed from the At Ease panel.

If the item is in the Launcher window, you will need to go into the Launcher items folder located in the System folder and remove the alias for the item.

Performa: Generic Launcher Icon (7/93)

Revised: 7/22/93
Security: Everyone

Performa: Generic Launcher Icon (7/93)

==========

Article Created: 21 July 1993

TOPIC --------------------

My Launcher icon has turned into the generic document icon (a piece of paper with a folded corner). Why would this happen, and how can I get my old icon back?

DISCUSSION --------------------

You need to rebuild the desktop file to get your icons back to their original state. To do this, hold the Command and option key down while the computer is starting up. (The Command key is the key with the Apple on it.) Hold both keys down until you get a dialog box that asks if you really want to rebuild the desktop. Once the desktop is rebuilt, your original icon should appear.

However, the Launcher icon will occasionally not reappear after you rebuild the desktop. If it doesn't, the only way to get the original icon back is to copy a new version of the Launcher application into the System folder. You can do this by going to a Performa retailer and copying the Launcher application to a floppy disk. Use the copy to replace the Launcher on your hard drive.

You can also restore your entire hard drive from backup disks, but that may be an extreme measure. On the Performa, you cannot restore single files created using Apple Backup. So unless you backed up another way, you will have to restore everything.

Performa: Kensington System Saver (3/94)

==========

Article Created: 21 July 1993
Article Reviewed/Updated: 7 March 1994

TOPIC ----------

I recently replaced my Apple IIGS with a Macintosh Performa 405. On my IIGS I used a Kensington System Saver. Can I use the Kensington System Saver with the Performa?

DISCUSSION ----------

Kensington doesn’t recommend using this unit on a Macintosh Computer. The System Saver was designed to add a fan and surge protection to the Apple IIgs. The Performa 405, like all newer Apple Macintoshes, has a fan built-in and therefore requires no additional fan. You can purchase a surge protector from most hardware stores and have all the features the System Saver afforded.

Kensington also offered a System Saver for the compact Macintosh computers such as the 128, 512K, 512KE, SE, Plus, SE/30, Classic, Classic II and Performa 200. As with the System Saver for the Apple IIgs, this System Saver will not fit on the Performa 405 or LC platform.

Article Change History:
7 March 1994 - Clarification of what Kensington offers for specific Macintosh and Performa computers.

Personal LW LS: Supports Grayscale (5/94)

==========

Article Created: 21 July 1993
Article Reviewed/Updated: 24 May 1994

TOPIC -----

Is there a way to do grayscale printing from a Personal LaserWriter LS? I just bought it, and it works great for text, but most of the graphics don't look very good.

DISCUSSION -----

To print grayscale, you need to use the Personal LaserWriter 300 driver, Chooser v 7.3, and Personal LaserWriter LS Prep. These items areon the Personal LaserWriter 300 installer disk and the GrayShare Update disk.

Extension	Version
Personal LW LS Prep	1.0
LaserWriter 300	1.2
Chooser	7.3

Article Change History:
17 May 1994 - Corrected article to include support for grayscale support.
24 May 1994 - Added GrayShare Update disk to article.

Performa: Using PageMaker 3.0 w/ Sys7.1 (7/93)

==========

Article Created: 21 July 1993

TOPIC -----

I'm having problems with Page Maker 3.0 on my Performa 450. The spacing is wrong when I print even though it looks correct on screen. I'm using an ImageWriter II. When I switch to Claris Works, the spacing is OK. Is it a System 7.1p problem?

DISCUSSION -----

Aldus recommends using PageMaker 4.0 or later with System 7.1. Your version may simply be to old to be compatible. This may also be part or all of the problem.

You may also try choosing "Best" in the Print window. Choosing the "Draft" mode could be the root of the spacing problem.

Performa 405: Managing Memory (7/93)

Revised: 7/22/93
Security: Everyone

Performa 405: Managing Memory (7/93)

==========

Article Created: 21 July 1993

TOPIC ----------

I have a Performa 405 with an additional 2MB of RAM. When I have three or more applications open and return to the Finder, I get a message that says there isn't enough memory to mount the Launcher.

DISCUSSION ----------

Even with the additional 2 MB of RAM, you could be running out of RAM with multiple applications open. If you are consistently getting an error message when you are running three applications, try running two of them. Then, go back to the Finder using the Application menu (just to the right of the Balloon Help in the menu bar). Check the "About this Macintosh" area in the AppleMenu items. See how much available memory is left and then check your other applications' memory size by highlighting the applications' icons and using Get Info from the File menu.

In the lower right corner of the Info window for each application, there are memory settings. The preferred size is what you need to really look at closely. Subtract that amount from the available memory.

If you have less than 200 or 300k of RAM left, then you have a memory problem. You can solve it three ways: lower your applications' preferred memory sizes, install additional RAM, don't run all three programs at one time, or turn on Virtual Memory to get additional RAM.

When open and quit applications, you create memory fragmentation, which can also rob you of available memory. If you can open and close applications a few times before you see the error message, then the problem is related to memory fragmentation. To fix this problem, close all your applications and restart. Then restart your applications. Once you open an application, close it (don't quit) and it will not fragment memory the next time you open it.

In either case, when you go back to the Finder from your applications, the

Finder is trying to allocate the required amount of RAM for the Launcher and is unable to do so with your memory constraints.

Performa 405: Memory Upgrade Information (3/94)

Revised: 3/15/94
Security: Everyone

Performa 405: Memory Upgrade Information (3/94)

==========

Article Created: 21 July 1993
Article Reviewed/Updated: 15 March 1994

TOPIC ----------

I want to upgrade the memory of my Performa 405 from four to 10MB. Would I add a card rather than replace the existing one? What is the generic name of the card I should look for?

DISCUSSION ----------

Memory upgrades for the Performa 405 are accomplished with SIMMs rather than a memory card.

To perform a 10 MB upgrade, you need two 4MB SIMMs rated at 80ns or better (70, or 60ns).

The only cards you'd use with your Performa to improve performance would be a third-party accelerator card, which could improve the speed of most of your applications, but not increase your memory capacity.

Performa: AtEase System Error Type 41 (8/95)

Revised: 8/8/95
Security: Everyone

Performa: AtEase System Error Type 41 (8/95)

==========

Article Created: 21 July 1993
Article Reviewed/Updated: 08 August 1995

TOPIC ----------

I tried to shutdown while in At Ease on my Performa 405, but I repeatedly get a system error message, type 41, saying I would have to restart and either turn off At Ease or shut down from Finder to successfully shutdown. What can I do?

DISCUSSION ----------

Error 41 is a "Can't load Finder" error. When you have At Ease turned on, Finder is not running. First, try reinstalling your system software. That should solve the problem.

To reinstall your system software:

1) Startup with Utilities disk in your floppy drive.

2) Open your hard-drive window.

3) Open your System folder and throw away Finder.

4) Close your System folder.

5) Rename your System folder something like Storage.

6) Close your hard-drive window.

7) Run Apple Restore.

This created a new System folder for you. Any fonts, or additional Control Panels and Extensions are still located in your Storage folder. You will need to move these over to your new System folder to enable them.

If you continue to get the error message on shutdown, your problem is probably either a corrupted Finder, or an extension problem. If you have any disk compression applications like Autodoubler, TimesTwo, or E-Disk you should remove these items and copy the Finder from the Utility disk to your System Folder on your hard drive, then restart.

It is possible that you might have some other extension conflict. The best thing to do would be to remove all of your third-party extensions and control panels (place them in a folder on your desktop), then one by one place them back into the System folder. After you place one into the System folder,try shutting down from within At Ease. As soon as you place one into the extension folder, then try to shut down and receive the error message, you will know which is causing the problem.

Personal LaserWriter LS: Memory Upgrades (7/93)

Revised: 7/22/93
Security: Everyone

Personal LaserWriter LS: Memory Upgrades (7/93)

==========

Article Created: 21 July 1993

TOPIC -----

I understand that I can upgrade the memory of my Personal LaserWriter LS to a total of 1MB. Does this require special SIMMS, or can I use SIMMS from my Mac Plus? I'm hoping to improve the quality of my graphics.

DISCUSSION -----

You can upgrade the Personal LaserWriter LS using DRAM chips (not SIMMS). However, this really doesn’t help with quality since all the processing is done on your computer and not in the printer. If you are looking for ways to increase the speed of the printing, you are better off increasing the RAM in your computer. Also any increase in the CPU speed will decrease the time it takes to process the printing.

Performa: SCSI Problems With Third-Party Drives (7/93)

==========

Article Created: 21 July 1993

TOPIC -----

I have a Syquest drive that works fine on my IIsi. When I attach it to the SCSI port of my Performa 450 I can't boot to the desktop. What can I do?

DISCUSSION -----

There have been some odd SCSI situations with some third-party drives on all types of Macintosh computers. If the drive works on your Macintosh IIsi, then it probably isn’t a drive problem, but you should still check it.

First, make sure that the SCSI ID is not set to either 0 or 7.
Next, try removing the termination of the drive. In some cases, this will fix the problem.

If you still can't boot, try double termination. In other words, try adding another terminator to the drive.

System 7.x: Troubleshooting System Errors Type 1, 2, & 3 (8/95)

Revised: 8/15/95
Security: Everyone

System 7.x: Troubleshooting System Errors Type 1, 2, & 3 (8/95)

==========

Article Created: 20 July 1993
Article Reviewed/Updated: 15 August 1995

TOPIC ----------

I sometimes get a message, "Sorry, the application 'untitled' unexpectedly quit because an error of type (1, 2, or 3) occurred." Can you tell me what these numbers refer to?

DISCUSSION ----------

Type 1, 2, and 3 errors are System 7 memory-addressing errors. These are usually caused by two things: non-System 7 compatible software and software conflicts.

System 7 compatibility issues usually occur with older software designed for System 6.x or earlier. If your software falls into this category, contact the software vendor to get an updated version of the software that works with System 7.x.

Software conflicts most often involve problems with Extensions and Control Panels. Depending on which version of System 7 you have, you can troubleshoot these items in the following way:

If you have System 7.0 to System 7.1.2
==========

Step 1

Restart your Macintosh computer with the shift key held down until you see the message "Welcome to Macintosh, Extensions off". This procedure temporarily turns off all non-essential extensions and control panels.

Step 2

Try to recreate the failure. If the failure does not reappear, then you have an extension conflict. Go to Step 3.

If the failure continues to occur it is probably not related to any third party extension or control panel, you may need to contact the software vendor to upgrade your application.

Step 3

To determine which of your extensions or control panels is causing the failure, create a folder on your desktop and place all your non-Apple extensions and control panels in that folder and restart your computer.

Step 4

One by one, place the items back into your System Folder, restarting and attempting to recreate the failure every time you add an item. When the failure reoccurs, then you know that either the last item you added, or a combination of the items you have added is causing your conflict. Contact the vendor of the extension or control panel to see if there is an updated version available.

If you have System 7.5 and later
==========
Step 1

Restart your Macintosh Computer and hold down the Space Bar until the Extensions Manager control panel opens.

Step 2

Use the pull down menu in the Extensions Manager to choose "All Off"

Step 3

Try to recreate the failure. If the failure does not reappear, then you have an extension conflict. Go to Step 4.

If the failure continues to occur, it is probably not related to any extension or control panel, you may need to contact the software vendor to upgrade your application.

Step 4

Restart your Macintosh Computer and hold down the Space Bar until the Extensions Manager control panel opens. Turn on groups of extensions and control panels by clicking to the left of each item to put a check mark by the item. Close the Extensions Manager control panel using the close box in the upper left corner.

Step 5

Try to recreate the failure.

Step 6

Repeat Steps 4 and 5 until you have isolated the conflict to a single extension

or group of extensions.

You can attempt to remedy a conflict by changing the loading order of a given extension or control panel by locating the file in the System Folder and adding a space or spaces to the front of the file's name. There are also third party utilities like Now Startup Manager and Allright Enhancements that allow you to test and manage extensions and control panels.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Macintosh: When to use 32-Bit Addressing (1/96)

Revised: 1/4/96
Security: Everyone

Macintosh: When to use 32-Bit Addressing (1/96)

==========

Article Created: 21 July 1993
Article Reviewed/Updated: 4 January 1996

TOPIC -----

When should I use 32-bit addressing on my Macintosh computer?

DISCUSSION -----

32-bit addressing is used by the system software when you have more than 8 MB of RAM. With more than 8 MB of RAM, you must turn 32-bit addressing on or the system software will not recognize the memory above 8 MB. For example, if you have 32 MB of RAM installed and don’t have 32-bit addressing turned on, 24 MB of RAM will be unavailable.

If you have less than 8 MB of RAM, it is best to leave 32-bit addressing turned off. Although most applications today are capbable of being run with 32-bit addressing turned on, some older applications are not 32-bit clean and cannot run with it turned on.

Note that some earlier Macintosh computers may not be able to use 32-bit addressing, and more recent Macintosh computers may run only in 32-bit mode. Check the technical specifications of the specific Macintosh computer for additional information.

Performa: Virtual Memory & When To Use It (7/93)

==========

Article Created: 21 July 1993

TOPIC -----

I've heard that not all programs can operate under Virtual Memory. Is this true? What about using Virtual Memory with a CD-ROM instead of upgrading installed memory?

DISCUSSION -----

Virtual Memory, just like 32-bit addressing, cannot be used with all applications. Some older versions of programs don’t know how to work with Virtual Memory turned on. The only way to find out if your programs will work with Virtual Memory is to either call the software vendor, or try turning Virtual Memory on and running the application.

Using Virtual Memory will slow the computer down, so it is not a good idea to have it turned on when you're trying to work with a CD-ROM disk. It should work, but speed and performance suffer badly enough to render some things -- like interactive CDs, animations, and QuickTime movies -- practically unusable.

Quadra 950 & Digidesign Pro Tools: Use Serial Switch (7/93)

Revised: 7/27/93
Security: Everyone

Quadra 950 & Digidesign Pro Tools: Use Serial Switch (7/93)

==========

Article Created: 19 July 1993

TOPIC ----------

A Macintosh Quadra 950 is giving frequent Type 1 errors when using Pro Tools from Digidesign. There is a Digidesign Nubus card installed in the Quadra. We have tried reinstalling the system software, which did not solve the problem. Is there a problem with the hardware or software from Digidesign?

DISCUSSION ----------

When using Pro Tools from Digidesign with a Macintosh IIfx, Quadra 900, or Quadra 950, you must set the Serial Switch control panel to compatible mode. This is the case even if the serial ports are not in use at the moment, since the Pro Tools program attempts to configure the ports as soon as you launch it. (Other programs may not configure the serial ports immediately, thus the errors not show up right away. Still other programs won't need Serial Switch set to compatible mode at all.)

After changing the mode in the Serial Switch control panel, you'll need to restart your system.

The most recent version of Serial Switch is 1.1.

Disk First Aid: Can't Repair Corrupted Files (7/93)

==========

Article Created: 22 July 1993

TOPIC ----------

I tried Disk First Aid to find and repair a problem in a text file I was working on. It said everything was fine. Why won't it recognize the problem?

DISCUSSION ----------

If Disk First Aid said the hard disk or floppy disk your file was on was fine, your problem is probably a corrupted data file (such as a word-processing file) or application.

Disk First Aid will check for and correct damage to the directories and catalog files. It cannot check individual files for corruption. The only thing to do is to replace it if you have a backup copy or recreate it, as you will probably need to do with your text file. If it is a corrupted application, reinstall from the master.

Disk First Aid: Checking a Floppy (2/95)

==========

Article Created: 22 July 1993
Article Reviewed/Updated: 21 February 1995

TOPIC ----------

How do I check a floppy disk with Disk First Aid?

DISCUSSION ----------

Note: Disk First Aid has been included with all Macintosh System software since System 2.0 (Finder 4.1/System 5.5), released in 1986, with the exception of System 5.1.

The location of the Disk First Aid software varies between System software versions, here is a chart showing where to find it for various System Software releases:

Location of Disk First Aid Software
==========

System Version	Disk Name
System 2.0	Utilities
System 5.0	Utilities 1
System 5.1	* Not Included *
System 6.0 - 6.0.8	Utilities 1 (800K System version)
System 6.0.7 - 6.0.8	System Additions (1.4Mb System version)
System 7.0 - 7.5	Disk Tools (if floppy based System, otherwise CD included with System)
Performa Systems	Utilities (or CD included with System)

Floppy Disk Testing Procedure
==========

For Hard Drive Based Systems:

Step 1
Locate the disk or CD containing the Disk First Aid program.

Step 2
Copy Disk First Aid to the hard drive by dragging the icon for Disk First Aid from this disk or CD to the icon for the hard drive.

Step 3
Eject the disk or CD containing the Disk First Aid program by dragging its icon to the Trashcan.

Step 4
Open the hard drive and double-click the Disk First Aid icon.

Step 5
Insert the disk that needs to be scanned.

Step 6
For versions of Disk First Aid prior to 7.2, click the Drive button until the floppy is selected, and click Open, and then click Start. For versions 7.2 and later, select the icon of the floppy, and click Repair.

Step 7
When testing is done, select Quit from the File menu.

For Floppy Based Systems (No Hard Drive):

Step 1
Locate disk containing the Disk First Aid program.

Step 2
Make sure your computer is off.

Step 3
Insert this disk into your floppy drive, then turn on your computer. The disk containing Disk First Aid will be a bootable disk.

Step 4
Double-click on the disk icon, and then double-click on the Disk First Aid program.

Step 5
Click the Eject button to eject the boot disk, and insert the disk that you want to scan.

Step 6
Click the Open button, and then click Start.

Step 7

When testing is done, select Quit from the File menu.

Performa: Forgot At Ease Password (8/95)

Revised: 8/14/95
Security: Everyone

Performa: Forgot At Ease Password (8/95)

==========

Article Created: 22 July 1993
Article Reviewed/Updated: 14 August 1995

TOPIC ----------

I tried what I thought was my password for At Ease and nothing works. I can't make any changes, it seems, without it. What do I do?

DISCUSSION ----------

Place the Utilities disk in the floppy disk drive, and turn the computer on. This starts the computer with the system on the Utilities disk, instead of the hard drive's system folder. This allows you to bypass At Ease and the password.

Next, open the hard-drive window, then open your System folder. Inside the System folder you will find a folder called Control Panels. Open this folder, and then double-click the At Ease Setup icon.

One of the options in the At Ease Setup control panel is Change Password. Enter a new password, or press the DELETE key on your keyboard to remove any type of password protection. After you do this, close the At Ease Setup control panel and restart your computer.

Performa: Partial Restore (7/93)

==========

Article Created: 21 July 1993

TOPIC ----------

I Have a Performa 405. Can I restore part of the data, or even just one file, from my backup disks created using Apple Backup, or do I have to restore the entire hard drive?

DISCUSSION ----------

Apple Restore only allows you to restore the entire disk, not just individual parts. As a general rule, Preference files, like a Help file, can usually be thrown away. If you've lost a Preference file, don't restore to retrieve it. The application that created them will recreate them the next time launch the application.

Centris 650: Startup Problems (7/94)

==========

Article Created: 22 July 1993
Article Reviewed/Updated: 28 July 1994

TOPIC ----------

I set up my new Centris 650 just as the manual instructed, but it won't power on. What did I do wrong?

The information in this article relative to the Centris 650 is also relevant to the Quadra 650.

DISCUSSION ----------

Try reseating the power supply. Most of the time, making sure the power cable is plugged in securely to the rear of the unit and to the power source will solve the problem. Also check that the power strip switch is turned on.

If the problem continues, contact your local dealer or call 1-800-SOS-APPL for further assistance.

Apple Internet Router 2.0 to 3.0 Upgrade Problem (7/93)

==========

Article Created: 22 July 1993

TOPIC -----

I'm trying to upgrade from the Apple Internet Router (AIR) 2.0 to 3.0, and want to use my old AIR 2.0 settings. I followed the instructions on pages 11-12 of the manual for upgrading from AIR 2.0, but when I tried to open the settings within AIR 3.0, it didn't show up in his select box. The document did show up in the finder, however. Rebuilding the desktop didn't help.

DISCUSSION -----

Use ResEdit and give your old document the same type and creator as a new AIR 3.0 settings document.

AOCE Brief Description (7/93)

Revised: 7/22/93
Security: Everyone

AOCE Brief Description (7/93)

==========

Article Created: 3 August 1993

TOPIC ----------

This article provides a brief describes of the Apple Open Collaboration Environment (AOCE).

DISCUSSION ----------

With AOCE, collaboration services are integrated into the System 7 operating system, enabling users to consolidate many forms of electronic correspondence common today such as voice mail, electronic mail, and faxes. In addition, third-party developers will be able to build on AOCE's foundation to create and deliver new kinds of applications for integrated personal communications, team productivity, and affordable workflow systems, such as forms processing.

The first two versions of AOCE based software products, one that will reside on an individual end user's desktop Macintosh or Apple PowerBook, and one that provides additional server-based collaboration services for AppleTalk networks. The end-user product, PowerTalk, includes collaboration services for the individual, such as a universal mailbox for integrated electronic correspondence, an easy drag-and-drop method of sending documents, a rich catalog capability for easy access to all kinds of information, and a digital signature capability, which enables electronic approval of documents.

The server product, PowerShare Collaboration Servers, provides services for small or large groups of PowerTalk users. These services include a shared store-and-forward facility for electronic messaging, server-based authentication and privacy for secure network communications, and centralized administration of shared catalogs that are distributed across multiserver networks for optimal performance. PowerShare catalogs that are distributed across multiple servers can be replicated and synchronized for reliability.

The PowerTalk and PowerShare products are based on AOCE's architecture, which has open application programming interfaces (APIs) so that third-party developers can easily take advantage of AOCE services from within their products. In addition, Apple and third-party developers can create software modules that provide plug-and-play access from AOCE based applications to existing and future messaging and directory services.

Playback Quality of 16-bit Audio on Macintosh Hardware (1/96)

Revised: 1/31/96
Security: Everyone

Playback Quality of 16-bit Audio on Macintosh Hardware (1/96)

==========

Article Created: 21 July 1993
Article Reviewed/Updated: 31 January 1996

TOPIC ----------

I mounted an audio compact disc and converted one of the tracks to a QuickTime movie sound file using 44.1KHz, 16-bit, Stereo settings in MoviePlayer's Open…/Convert…/ Options… dialog. When I listened over headphones connected to the computer, the playback of the file through MoviePlayer had a hiss or background noise. When I played the track from MoviePlayer before it was converted (the option screen has a play selection) the sound file had the same background noise. However, when I played the same CD track through CD Remote with headphones connected directly to the CD player the sound was great and there was no background noise.

Why is there noise when playing back from MoviePlayer? Shouldn't the playback be equal to the original?

DISCUSSION ----------

The reason for the apparent noise in the playback is due to the lack of 16-bit 44.1KHz audio playback hardware on some Macintosh computers. Using the file settings you indicated, the file will be an identical copy of what is on the audio CD. The QuickTime movie file on disk is a full CD-quality 16-bit, 44.1KHz, stereo sound file. However, to enjoy the full clarity of this file, your Macintosh computer must be capable of 16-bit, 44.1KHz sound output. Starting with the original AV computers released in July 1993, most subsequently released Macintosh computers have 16-bit sound capability. The Power Macintosh 5200, 5300, 6200, and 6300 series computers have 16-bit sound out capability but only at 22.05KHz. You can use this procedure below to determine if your computer supports 16-bit sound:

Step 1

Choose Control Panels from your Apple menu.

Step 2

Open the Sound control panel.

Step 3

Choose "Sound Out" from the "Alert Sounds" pull down menu. If the 16-bit sound radio button is grayed out, you only have 8-bit sound capabilities.

If 16-bit is not grayed out, make sure there is a dot in the radio button next to it.

Step 4

Use the close box in the upper left corner to close the Sound control panel.

Older Macintosh computers that do not support 16-bit sound can be made 16-bit capable by adding an audio card like Digidesign's AudioMedia II card. To use a 16-bit audio card like this will require Sound Manager 3.x and a Sound Manager component (driver) for the card. The driver component will be supplied by the card manufacturer.

Creating a sound file from the audio disc using the method described is actually a file transfer from the audio disc to the Macintosh hard disk. Thus, there is no conversion of the digital audio to analog audio when transferring the track from the audio disc to the hard disk. By keeping the audio track in the digital domain, it is possible to make an identical copy. Using the 44.1KHz, 16-bit, Stereo options provides that identical copy. The reason noise is introduced when playing back the sound through your computer is the limit of the of 8-bit sound only Macintosh audio hardware.

What happens to the recorded sound on 8-bit only sound capable computers
---
When playing back the sound without 16-bit hardware, the Sound Manager must throw away half of the bits in the audio samples and playback only half of the samples that exist. Thus, the actual data being used is only 25% of the original file.

The reason only 25% of the original data is used is because 8-bit sound Macintosh computers only sample at 22.05KHz. Therefore, the 16-bits must be reduced to 8-bits; and the 44.1KHz must be reduced to 22.05KHz. The Sound Manager accomplishes this "dithering" (known as "downsampling") of the sound - much like QuickDraw dithers a 24-bit color image into an 8-bit color image.

As a side note: Sound Manager 3.x uses a more sophisticated method of downsampling than Sound Manager 2.0. This improves the playback quality of the 16-bit, 44.1KHz sound file on an 8-bit, 22.05KHz system; although, it does not come close to playing back the full 16-bit, 44.1KHz recording.

Digital audio engineers would not usually use "noise" to describe what is happening to the sound. It is more correctly called quantization distortion. Unless you are discussing this issue with a digital audio engineer, "noise" is

an acceptable phrase - that is, after all, what it sounds like to the your ear.

In digital audio the main measurement of maximum expressible amplitude to error ratio is called Signal-to-Error (S/E) ratio. This expressible amplitude is also referred to as the "maximum signal" of the recorded sound. The error is what is perceived as noise. The S/E ratio specification of a digital system is closely related to the Signal-to-Noise (S/N) ratio of an analog system, although it is not identical in nature due to differences between digital and analog methods.

The S/E ratio can be expressed specifically by calculating first a maximum signal value, second an error value, and finally creating their ratio. Although there are intervening steps in the math, the final formula to use when calculating the strength of the audio signal above the noise (distortion or error) level looks like this:

```
6.02 * n + 1.76 dB
```

Where n is equal to the number of bits in the sample. The following results are approximate signal above noise ratios for a various number of bits in a sample. Generally, the calculated results will be slightly higher than the measured results. Also, specific implementations of hardware will affect the actual measured ratios in a downward fashion.

```
16-bit samples (number in CD audio)  = 98 dB
12-bit samples                       = 86 dB
 8-bit samples (Macintosh sound)     = 48 dB
```

To relate the quality of these digital recordings to analog recordings, think of the 8-bit recordings as inexpensive cassette recorders with inexpensive tape. The 12-bit recordings correlate to high quality cassette recorders with noise reduction and metal tape. The 16-bit recordings equate to professional studio reel-to-reel tape recorders with noise reduction and professional tape at high tape speeds.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

Article Change History:
31 Jan 1996 - Added 8-bit and 16-bit computer information.
26 Jan 1996 - Made minor technical and formatting changes.

Macintosh AV Series: Technologies Overview (12/93)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 14 December 1993

TOPIC -----

What does the AV in the Quadra 840AV, Centris 660AV and Quadra 660AV stand for?

DISCUSSION -----

The AV in the product name refers to the audio/visual technologies that are integrated in the Macintosh AV Series computers.

These AV technologies focus in three key areas: telecommunications, speech, and video. At the core of the AV technologies used in the Quadra 840AV and Centris 660AV are the following new features:

- The AT&T DSP3210 Digital Signal Processor (DSP) chip. The DSP which can process modem signals, record and playback up to 16-bit stereo sound, manage speech recognition, and perform text to speech conversions via Apple's PlainTalk software.

- Integrated video input and output capabilities conforming to NTSC, PAL, and SECAM formats via S-Video and Composite Video input/output ports.

- Direct memory access (DMA) for SCSI based peripheral devices, such as hard disks and CD-ROM drives.

- A new integrated telecommunications architecture called GeoPort that will accommodate analog, ISDN, fax, and other signal forms.

Article Change History:
14 December 1993 - Retitled and revised topic to reflect entire AV series.

Macintosh AV Series: Differences (12/93)

Revised: 12/23/93
Security: Everyone

Macintosh AV Series: Differences (12/93)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 23 December 1993

TOPIC ----------

What are the major differences between the Macintosh Centris 660AV, the Quadra 660AV, and the Quadra 840AV?

DISCUSSION ----------

The major differences between the members of the Macintosh AV Series are:

Feature:	Quadra 840AV:	Centris/Quadra 660AV:
Processor	MC68040 @ 40 MHz	MC68040 @ 25 MHz
DSP (Digital Signal Processor)	AT&T DSP3210 @ 66 MHz	AT&T DSP3210 @ 55 MHz
DRAM Expansion	From 8 MB to 128 MB	From 8 MB to 68 MB
DRAM Slots	4 slots	2 slots
DRAM Speed	60 ns (nanoseconds)	70 ns
DRAM SIMM Sizes#	4, 8, 16 and 32 MB SIMMS	4, 8, 16 and 32 MB SIMMS
VRAM	2 MB (1 MB standard)	1 MB (I MB standard)
VRAM Slots	4 slots	none
VRAM SIMM Size	256K	n/a
VRAM Speed	80 ns (nanoseconds)	80 ns
NuBus Slots	3	1*
Power On/Off Control from NuBus cards	Yes	No
PDS Slot	No	Yes - 1
DAV Connector (Digital Audio Visual)	On Logic Board	On Optional NuBus Adapter Card
MUNI Chip (Macintosh Universal NuBus Interface)	On Logic Board	On Optional NuBus Adapter Card

Composite SIMMs are not supported.
* With optional Centris 660AV NuBus Adapter Card installed.

Article Change History:
23 December 1993 - Added all members of the AV Series, changed title.
8 August 1993 - Corrected the number of VRAM Slots on the Centris 660AV and Quadra 840AV. Added the VRAM Size for the Quadra 840AV.

AV Technologies: (Centris 660AV & Quadra 840AV) Sound (7/93)

Revised: 7/26/93
Security: Everyone

AV Technologies: (Centris 660AV & Quadra 840AV) Sound (7/93)

==========

Article Created: 29 July 1993

TOPIC ----------

What are the AV Technologies sound capabilities in the Centris 660AV and Quadra 840AV?

DISCUSSION ----------

In addition to the on-board DSP (Digital Signal Processor) chip, the Macintosh Centris 660AV and Quadra 840AV boast a new Custom chip, the Singer ASIC (Apple Single Integrated Circuit).

The Singer ASIC is a new 16-bit stereo coder/decoder (CODEC), used to support very high quality stereo sound input and output. Singer conforms to the IT&T ASCO 2300 Audio-Stereo CODEC Spec.

The implementation is flexible and supports sound digitization rates from 7.2 KHz to 48 KHz. Digitized sound is transmitted through the DMA (Direct Memory Access) controller and is available at the DAV (Digital Audio Video) connector for additional manipulation and processing tasks.

The DSP handles sound processing in addition to other functions such as sample rate conversions, and MACE (Macintosh Audio Compression and Expansion) compression/decompression. As on previous Quadra and Centris models, an audio input pin is available on the logic board that permits direct play through of CD audio coming off the analog output connector on an internal CD-ROM drive.

Both the Quadra 840AV and Centris 660AV contain an internal speaker that automatically mixes audio and system signals. A high quality speech-capable microphone is included with all systems in the USA only. (The microphone is available as a separate item in Europe and Pacific markets.)

The Sound control panel has been improved in order to support the new

sound capabilities of the Quadra 840AV and Centris 660AV. The Sound control panel now has an integrated pull down menu that controls alert sounds, sound in source selection, and sound out options.

For further information on the DSP chip, please search by "DSP" in the Tech Info Library.

Macintosh AV Series: Software Enhancements (12/93)

Revised: 12/23/93
Security: Everyone

Macintosh AV Series: Software Enhancements (12/93)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 23 December 1993

TOPIC ----------

What are the software enhancements incorporated into the Macintosh Centris 660AV, the Quadra 660AV and the Quadra 840AV?

DISCUSSION ----------

System Software

The Centris 660AV, Quadra 660AV and Quadra 840AV require System Software 7.1 and System Enabler 088 in order to operate.

QuickTime 1.6.1 is included and has been enhanced to support built-in video features, provide better playback performance, and require less memory to run.

System software is shipped on bootable CD-ROMs with those units equipped with an internal CD-ROM drive.

SCSI Manager 4.3

SCSI Manager 4.3 is a new system level manager that extends the capabilities of Macintosh systems both in terms of functionality and performance.

This new SCSI Manager is fully asynchronous, allowing each of several SCSI devices to have multiple requests outstanding. By queuing requests in this manner, overall throughput is improved. Other features such as direct memory access (DMA) support further enhance overall performance. Functionality has been improved through support for multiple buses and hardware configurations, and support for SCSI-2 messages and protocol actions.

Real-Time Manager

The Real-Time Manager is a key part of Apple's Real-Time Architecture (ARTA), providing a uniform API (application programmable interface) to DSP capabilities. These DSPs can reside on the logic board or on NuBus cards and are scalable in that multiple DSPs are supported.

Sound Manager 3.0

Sound Manager 3.0 represents a marked change from past sound manager versions and supports many new features that greatly enhance Macintosh system sound. In addition, the internals of the Sound Manager have been rewritten, resulting in a more flexible tool that can better accommodate new hardware capabilities.

New features provided by the Sound Manager 3.0 include:

- Support for a wider range of data types, including 16-bit stereo sounds, 11 - 48 KHz sounds, MACE (Macintosh Audio Compression and Expansion) 3:1 and 6:1 compression ratios, and MIDI

- Support for Sound Panel components which allow developers to create snap-in control panels for sound devices and algorithms

- Device independence, allowing the Macintosh to support sound chips other than the Apple Sound Chip, and to support output devices other than the Apple internal speaker.

- A uniform API across hardware systems

- More efficient use of the system processor

- Smaller memory footprint

- Improved sound performance

- Backward compatibility with previous sound managers

PlainTalk

PlainTalk is Apple's implementation of speech technology, it refers to two separate parts: speech recognition which responds to verbal commands from the user, and text-to-speech (TTS) that allows the computer to communicate verbally with the user.

While computer speech recognition is still in its infancy, the Macintosh AV Series models introduce the most advanced system ever on a personal computer.

The speech system is unique in that it is speaker independent, accommodates continuous speech, and automatically adapts itself to the environment where it is being used.

Speech activated commands can be programmed through the use of AppleScript

when the application is AppleEvent aware, or through a new version of QuicKeys which supports spoken commands.

Text-to-speech refers to the ability of the Macintosh to interpret textual data and to "read" the data to the user in a near natural voice. Multiple voices at various sound quality levels are supported.

For further information on PlainTalk, please search in the Tech Info Library by the string "PlainTalk."

Article Change History:
23 December 1993 - Revised article, incorporating new title and new models.

Macintosh Centris, Quadra 660AV: Specifications (Discontinued)

Revised: 6/19/95
Security: Everyone

Macintosh Centris, Quadra 660AV: Specifications (Discontinued)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 20 January 1994

TOPIC ----------

This article gives the technical specifications for the Macintosh Centris 660AV and Quadra 660AV computer.

DISCUSSION ----------

Microprocessor

- Motorola 68040, 32-bit architecture, 25 Mhz clock speed
- Integrated floating-point unit (FPU)
- Paged Memory Management Unit (PMMU)
- 8 KB Cache

Digital signal processor (DSP)

- AT&T 3210 running at 55 Mhz
- Used for sound, speech recognition, telecommunications, and other real-time processing tasks.

Memory

- 8 MB of RAM standard: 4 MB of RAM soldered onto the logic board, and one 4 MB SIMM installed in one of memory expansion slots.
- Two memory expansion slots for 70ns 72-pin SIMMs. Supported SIMM sizes are 4, 8, 16, and 32 MB.
- Expandable to 68 MB of RAM by using 32 MB SIMMs in both SIMM slots. (Note: Dealer Installation Required)
- 256 bytes of non-volatile parameter memory (PRAM)
- 2 MB ROM (Two 512k by 16 chips)

Disk Drives

- One Built-in Apple SuperDrive 1.4 MB floppy disk drive that uses high-density floppy disks and reads, writes, and formats Macintosh, MS-DOS, OS/2, and ProDOS disks.
- Support for two internal SCSI devices, one of which may be used for removable media, such as an internal CD-ROM drive.
- One internal hard disk (80 MB, 230 MB, 500 MB options available)
- Optional internal Apple CD-ROM drive (see above)
- Optional external SCSI hard disk drive (many capacities available)

Video Display

- Supports all Apple displays up to 21 in.
- Supports some other non-Apple monitors, including VGA, SVGA, NTSC, and PAL 19" monitors

Video RAM

- 1 MB VRAM. (VRAM is non-expandable)
- VRAM is shared between graphics window and video window
- Maximum video window size at a color depth of 16 bits is 640 X 480

Interfaces

- One internal NuBus expansion slot via NuBus adapter, which includes support for digital-audio video (DAV) connector. (Only 7 inch NuBus cards are supported.)
- One Apple Desktop Bus (ADB) port, supporting a keyboard, mouse, and other devices.
- AAUI-15 Ethernet connector.
- Two serial (RS-232/RS-422) ports. (Printer & Modem/GeoPort)
- Two S-Video ports, one each for input and output.
- Two composite video ports, one each for input and output.
- SCSI interface for connecting up to a total of seven SCSI devices.
- Sound-out port for stereo playback from CDs or Macintosh audio applications
- Stereo sound-input port (supports 16-bit stereo audio)
- One monitor out port.

Networking

- Built-in Ethernet
- Serial port for AppleTalk
- Integrated GeoPort telecommunications architecture for data, fax, and voice connectivity.

Sound Generator

- DSP-based 16 bit stereo audio
- Sample rates: 8 Khz to 48 Khz

Keyboard

- Several Apple Desktop Bus keyboards with numeric keypads available.

Mouse

- Apple Desktop Bus Mouse II; mechanical tracking, optical shaft, or contact encoding.

Clock/Calendar

- Custom integrated circuit with long-life lithium battery.

Apple PlainTalk Microphone

- The microphone is unidirectional and optimized for use with speech recognition. (Microphone bundled with all units sold in the USA, available as a separate item outside the USA.)

Disability Access

- CloseView, Easy Access, and visible beep included with system software. These built-in features and third-party options provide alternative input and output tools for people with disabilities.

Electrical Requirements

- Line voltage: 100 to 240 VAC, RMS single phase, automatically configured
- Frequency: 47 to 63 hertz, single phase
- Power: 86 watts maximum. (Does not include monitor power.)

ADB Power Requirements

- Maximum current draw for all ADB devices: 500 milliamps (a maximum of three Apple Desktop Bus devices is recommended)
- Mouse draws 10 milliamps.
- Keyboard draws 25 to 80 milliamps, depending on the keyboard model used.

Size and Weight

Main unit

- Height: 3.4 inches (8.5 cm)
- Width: 16.3 inches (41.5 cm)
- Depth: 15.6 inches (39.7 cm)
- Weight*: 14.0 pounds (6.4 kg)

*Weight varies based on internal devices installed

Mouse

- Height 1.3 inches (33 mm)
- Width 2.4 inches (61.7 mm)
- Depth 4.2 inches (107.3 mm)
- Weight 4 ounces (0.10 kg)

Operating Environment

- Operating temperature: 50 degrees to 104 degrees F
  (10 degrees to 40 degrees C)
- Storage temperature: -40 degrees to 116.6 degrees F
  (-40 degrees to 47 degrees C)
- Relative humidity: 5% to 95% noncondensing
- Maximum altitude: 10,000 ft. (3,048m)

System Software Requirements

Requires System 7.1 or later and the System Enabler 088.

Article Change History:
20 January 1994 - Added Quadra 660AV name.
30 July 1993 - added correct name of System Enabler.

Macintosh Centris 660AV: Expansion Slot (7/93)

Revised: 7/26/93
Security: Everyone

Macintosh Centris 660AV: Expansion Slot (7/93)

==========

Article Created: 29 July 1993

TOPIC ----------

This article describes the expansion slot in the Macintosh Centris 660AV.

DISCUSSION ----------

The Centris 660AV has a expansion slot similar to the Centris 610 expansion slot and can be used in two different ways:

1) You can install a PDS (Processor Direct Slot) card directly into the slot.

2) You can install a 7-inch NuBus card after installing the optional Centris 660AV NuBus adapter card.

PDS Cards

A PDS (Processor Direct Slot) implementation brings the microprocessor address, control, and data lines, along with clock, power, and a few model-specific signals, to a single expansion connector on the main logic board. Apple uses the PDS expansion interface on selected Macintosh models as another option for system expansion.

PDS cards can be designed to work in both the Centris 610 and the Centris 660AV. However, there are some signal changes in the Centris 660AV, so not all current PDS cards will work in both models.

NuBus Cards

The Centris 660AV accepts one 7-inch NuBus card when the optional Centris 660AV NuBus adapter card is installed in the Centris 660AV expansion slot.

The Centris 660AV NuBus adapter card also includes the DAV connector.

This connector provides direct access to audio and video data directly from the logic board. In the Centris 660AV, the DAV connector is located on the optional NuBus adapter. Uses for DAV cards could include a graphics accelerator, audio/visual compression/decompression tasks, or provide PhotoShop plug in enhancements.

NuBus 90 Implementation

This NuBus implementation is based on the NuBus '90 specification. Variances from previous Quadra and Centris models include:

- The ability to control power on and off from a NuBus card (Quadra 840AV only)

- Faster data transfer rates including a 20 MHz card to card transfer rate that provides throughput rates at up to 80 MB per second.

Security: Everyone

Macintosh AV Series: Bundled Software (12/93)

==========

Article Created: 9 August 1993
Article Reviewed/Updated: 14 December 1993

TOPIC ----------

Is there a list of the software that included with the Macintosh Centris 660AV, Quadra 660AV and the Quadra 840AV?

DISCUSSION ----------

Each member of the Macintosh AV Series ship with a number of sample applications that showcase some of the AV capabilities. Both demo applications and utilities are provided by Apple and third party developers.

- ApplePhone 1.0 from Apple - this application uses the DSP to provide easy-to-use speakerphone/answering machine capabilities. (Requires the Geoport Telecom Adapter.)

- FaxTerminal 1.0 - a data and fax modem application (Included with the GeoPort Telecom Adapter.)

- ExperFax 1.02 from ExperVision - reads fax documents and converts text into a format that can be used with word processing applications. (This version of ExperFax has a limited life, users will able to process 30 conversions at up to 99 pages)

- FusionRecorder 1.0 from VideoFusion - allows users to create QuickTime movies by connecting to a video source, and will create audio files at up to 16 bits with sample rates up to 48 KHz.

- Video Monitor 1.0.1 from Apple - provides a live video window with print and capture capability.

- Script Editor 1.0 from Apple - allows users to create and edit AppleScript scripts.

- Speech Macro Editor 1.0 from Apple - lets users create and edit speech macros using AppleScript or QuicKeys as the engine.

- QuicKeys OSA Component from CE Software - when used with the Speech Macro Editor, the user can create speech macros that use QuicKeys as the script engine.

- QuicKeys Test Drive from CE Software - time limited trial version of the popular macro making utility.

- Sound Effects 1.0 from Apple - an extension that allows various special effects to be applied to any sound/audio output.

- ES•F2F 2.02 from the Electronic Studio - a LAN based video conferencing application that allows any two users on a LAN to connect and see each other, sound is not supported.

To contact third party vendors for further information on bundled software, search the Tech Info Library by the company's name: VideoFusion, ExperVision, CE Software or The Electronic Studio.

Article Change History:
14 December 1993 - Retitled and revised topic to include all members of the Macintosh AV Series.
23 August 1993 - Revised and added additional bundled software information.

Macintosh AV Series: Monitor Support (12/93)

Revised: 12/14/93
Security: Everyone

Macintosh AV Series: Monitor Support (12/93)

==========

Article Created: 9 August 1993
Article Reviewed/Updated: 14 December 1993

TOPIC

This article provides information on monitors supported on the Quadra 840AV, Quadra 660AV, and Centris 660AV and on how two frame buffers are used to support both computer graphics and video.

DISCUSSION

Frame Buffers

The members of the Macintosh AV Series are the first Macintosh computers to use two different frame buffers. These are the graphics frame buffer, and the video frame buffer. VRAM can be used in two different ways, either used completely by the graphics frame buffer (standard Macintosh display), or split 50/50 between the graphics frame buffer and the video frame buffer.

To achieve the highest graphics bit depth, the two frame buffers are often used together for graphics. Consequently, video-in is not available when displaying graphics at the highest bit depth for many monitors. When displaying live video, the two frame buffers are merged so the video-input appears as a window on the graphics display.

For example, a Quadra 840AV with 2MB of VRAM can support a 14-inch color monitor at 24-bits in a strictly graphic environment or can provide support for a 16-bit graphics window and a 16-bit video window.

VRAM & Bit Depth

The Quadra 840AV and Centris 660AV come standard with 1 MB VRAM. The Quadra 840AV is expandable to 2 MB VRAM. Upgrading the Quadra 840AV's VRAM to 2 MB permits 24 bit display (millions of colors) on monitors up to 16 inches and 16 bit (thousands of colors) on the 21-inch color monitor.

The machines can drive an NTSC or PAL monitor directly, without the use of an encoder box. In order for that feature to be enabled, the display resolution should be either 512x384 or 640x480 for NTSC, or 640x480 or 768x576 for PAL. Hence the different resolutions available for each display.

Notes:

1) The Macintosh Centris 660AV always has 1 MB of VRAM.

2) The Macintosh Quadra 840AV comes standard with 1 MB of VRAM and may be expanded to 2 MB of VRAM. Four 80 ns (nanosecond) 256K VRAM SIMMs are required.

3) Where multiple resolutions are available, an asterisk (*) indicates the standard resolution. Additional resolutions allow you to display more colors by only using a portion of the monitor. Select the resolution by using the Options dialog of the Monitors Control Panel. You must reboot to change resolutions. The size of the pixels will not change in these alternate modes. Instead, a black border will appear around the smaller active video area.

4) A "Flicker-free" mode (sometimes referred to as Apple Convolution) is available when displaying on a TV. This mode is available at up to 8 bits/pixel and is not available when using video-in.

5) bpp is Bits Per Pixel. A range is given in table below, indicating which of the following are available:

    1 bpp - Black & White
    2 bpp - 4 colors or greys
    4 bpp - 16 colors or greys
    8 bpp - 256 colors or greys (greys only for Video in)
   16 bpp - Thousands of colors (5 bits each of R, G, and B)
   32 (24 plus 8) bpp - Millions of colors (8 bits each of R, G, and B)

6) The maximum visible number of colors is millions. In the past, Apple has labeled this as 24 bit color. However, 24 bpp or 32 bpp are interchangeably used to mean support for millions of colors. When you see 32 bpp listed on the chart below, think 24 plus 8: 24 bpp for displaying millions of colors plus 8 bpp for special uses, such as alpha channel support and chroma key support.

7) Both the video and graphics portions of VRAM are often used together to display graphics at the highest available bit depth. In the table below, the range of graphics bit depths is marked with # when video-in is available at the maximum graphics bit depth. In all other cases video-in is not available when using the highest graphics bit depth.

---

Digital Signal Processor (DSP) - Overview (7/93)

Revised: 7/27/93
Security: Everyone

Digital Signal Processor (DSP) - Overview (7/93)

==========

Article Created: 29 July 1993

TOPIC ----------

This article gives a overview of the Digital Signal Processor (DSP) chip which is a part of the Macintosh Centris 660AV and Quadra 840AV computers.

DISCUSSION ----------

The Quadra 840AV and Centris 660AV are the first Macintosh computers that include a Digital Signal Processor (DSP) chip integrated on the logic board.

Apple uses an AT&T DSP3210 chip for both models, the only difference being the clock frequency which is 55 Mhz on Centris 660AV and 66.7 Mhz on the Quadra 840AV.

The DSP implementation on the Quadra 840AV and Centris 660AV uses it's own multitasking operating system (the Apple Real-Time Architecture or ARTA) but shares the same memory as the host CPU, the 68040. The Quadra 840AV and Centris 660AV are truly dual processor Macintosh computers, as both the 68040 and the DSP have equal access to system resources.

The DSP on the Quadra 840AV and Centris 660AV is primarily responsible for performing real time processing of tasks such as speech recognition, sound, analog modem signal processing, or any other time-correlated data. The DSP can also be programmed to perform non real-time (also called timeshare) tasks such as image processing.

Real-Time versus Timeshare Processing

The difference between real-time and timeshare processing is that real-time tasks such as speech recognition requires guaranteed processing bandwidth.

Timeshare tasks are processes that don't involve a time dependency such as image manipulation or number crunching. Timeshare tasks are processed whenever there is excess DSP bandwidth not being used by a real-time process.

Please note that real-time tasks will not necessarily execute faster than timeshare tasks. In many cases, timeshare tasks will get more of the processing bandwidth and will complete sooner than real-time tasks. Real-time refers to tasks that need a specific amount of data to be processed during a specific amount of time.

Sound Manager 3.0, Speed Recognition API, and the Communication Toolbox utilize the DSP, but for an application to do more than sound, telecommunications, and speech recognition, it will have to be specifically written to use the Apple Real-Time Architecture manager.

Macintosh Centris, Quadra 660AV: Description (Discontinued)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 19 June 1995

TOPIC ----------

The Macintosh Centris 660AV & Quadra 660AV incorporate Apple AV Technologies in a high performance form factor.

DISCUSSION ----------

Overview

With an innovative architecture that delivers new capabilities in telecommunications, video, and speech, the Apple Macintosh Centris 660AV & Quadra 660AV computer helps you work and communicate more effectively than ever before.

The Macintosh Centris 660AV & Quadra 660AV combines the horsepower of a 25-megahertz 68040 microprocessor with a 55-megahertz digital signal processor (DSP) to achieve outstanding performance. The DSP handles telecommunications, speech, and audio functions, allowing the 68040 processor to handle other tasks, thereby increasing the total system performance.

The power and built-in features of the Macintosh Centris 660AV let you take full advantage of exciting new audio-visual technologies. For example, with its built-in GeoPort telecommunications architecture, the Macintosh Centris 660AV can connect with telephone systems, so you can use your computer as a telephone, an answering machine, a fax machine, and an electronic mail station. Its video capabilities let you view or capture video from a VCR, laser disc, or camcorder in a window. You can also connect directly to a TV to show your presentations or to a VCR to make videotapes.

Using PlainTalk speech technology from Apple, the Macintosh Centris 660AV can respond to your voice commands. And it generates CD-quality stereo sound, so all your audio applications sound great.

..TIL12707-Macintosh_Centris_Quadra_660AV-Description_Discontinued.pdf

In short, the Macintosh Centris 660AV can serve as your personal communications center. Whether you're in the office or on the go, you can use it to work more efficiently and effectively than ever.

Power and Speed

- 25-MHz 68040 microprocessor
- 55-MHz digital signal processor (DSP)
- 32-bit data bus

Memory

- 8 MB of RAM standard, expandable to 68 MB

RAM note: All 8MM RAM configurations come with 4MB of RAM soldered onto the logic board and one 4MB SIMM installed in one of the two SIMM slots.

Display

- Works with all Apple monitors as well as NTSC, PAL, VGA, and SuperVGA displays
- Supports 16-bit color, allowing for display of thousands of vibrant colors

Expansion

- Twelve built-in ports for peripheral devices, including video (composite and S-Video formats) and audio
- One internal NuBus expansion slot via NuBus adapter, which includes support for digital-audio video (DAV) connector. (Only 7 inch NuBus cards are supported.)
- Optional internal CD-ROM drive (such as AppleCD 300i)

System software

- System 7 with multitasking, file sharing, QuickTime, Balloon Help, TrueType, and more

Networking

- Built-in AppleTalk networking
- File sharing without a dedicated server
- On-board Ethernet networking

Compatibility

- Reads Macintosh, MS-DOS, OS/2, and ProDOS floppy disk formats

What's in the box:

Each unit includes a power cord, keyboard cable, mouse, microphone, system software and a CD Caddy#.

System software includes System 7.1, System Enabler 088, Color Macintosh Basics, QuickTime 1.6, and HyperCard Runtime.

System software shipped on a bootable CD-ROM, the "Install Me First CD" which can double as a rescue disk.

Documentation included with the Centris 660AV:
- Getting Started with your Macintosh Centris 660AV
- Technical Information for the Macintosh Centris 660AV
- Macintosh User's Guide for desktop Macintosh computers
- AppleCD 300i User's Guide#
- Apple Extras User's Guide
  (Located in the Apple Extras folder on the hard disk.)

#(Only for systems with built-in CD-ROM drive.)

Configurations and Ordering Information:

- M1839LL/A: Macintosh Quadra 660AV with 8 MB of RAM, 230 MB hard disk.
- M9043LL/A: Macintosh Quadra 660AV with 8 MB of RAM, 230 MB hard disk, internal CD-ROM drive.
- M9044LL/A: Macintosh Quadra 660AV with 8 MB of RAM, 500 MB hard disk.
- M1840LL/A: Macintosh Quadra 660AV with 8 MB of RAM, 500 MB hard disk, internal CD-ROM drive.
- M9049LL/A: Macintosh Quadra 660AV NuBus adapter
- M1534LL/A: Macintosh Quadra 660AV Logic Board Upgrade
  (Upgrades a Macintosh Centris 610 or Quadra 610 computer to a Macintosh Quadra 660AV computer.)

RAM note: All 8MM RAM configurations come with 4MB of RAM soldered onto the logic board and one 4MB SIMM installed in one of the two SIMM slots.

Article Change History:
05 Jun 1995 - Added discontinued to parts no longer available.
20 Jan 1994 - Added Quadra 660AV model.
27 Aug 1993 - Corrected RAM information.

Macintosh AV Series: No Memory Interleaving (12/93)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 23 December 1993

TOPIC -----

Do the Macintosh Centris 660AV, Quadra 660AV and Quadra 840AV use the memory interleaving scheme introduced with the Centris 610, 650 and the Quadra 800?

DISCUSSION -----

No. None of the Macintosh AV Series models use the new highly efficient DMA (direct memory access) based memory architecture. This precludes the need for a memory interleaving design to achieve high performance.

For further information, please review the Tech Info Library article: "Macintosh AV Series: Software Enhancements."

AudioVision 14 Display: Comparison w/ Other Apple Monitors 7/93

Revised: 7/28/93
Security: Everyone

AudioVision 14 Display: Comparison w/ Other Apple Monitors 7/93

==========

Article Created: 29 July 1993

TOPIC ----------

How does the AudioVision 14 Display compare to the Apple Basic Color Monitor and/or the Macintosh Color Display?

DISCUSSION ----------

The AudioVision 14 Display is the basic Macintosh Color Display that has been re-designed to include several key features for sound integration and ease of use. There are major differences between the Apple Basic Color Monitor, which is a VGA type monitor, and the AudioVision 14 Display. For more information on features, use "AudioVision and features and benefits" as your search string.

Here is a comparison of their operational specifications:

Refresh Rate

Apple AudioVision 14 Display - 66.7 hz
Macintosh Color Display - 66.7 hz
Apple Basic Color Monitor (VGA) - 60.0 hz (precisely 59.94 hz)

The AudioVision 14 Display's high refresh rate reduces flicker and eliminates eye strain that accompanies the 60hz rate of the typical VGA monitor.

CRT Flatness

The surface of the AudioVision 14 Display's CRT is considerably flatter than that of Apple Basic Color Monitor.

There is less visual distortion when working in front of a flat screen as opposed to one which has a slightly curved surface.

Dot Pitch

Apple AudioVision 14 Display - 0.26 mm
Macintosh Color Display - 0.26 mm
Apple Basic Color Monitor (VGA) - 0.29 to 0.39 mm

Dot pitch is a specification which describes the distance between CRT pixels. The smaller the dot pitch, the sharper the display. Dot pitches in the 0.29 to 0.39 mm range produce an increasingly grainier look as the dot pitch approaches 0.39 mm. Consequently, the AudioVision 14 Display has a much sharper and cleaner appearance than does the Apple Basic Color Monitor.

CRT Type

Apple AudioVision 14 Display - Sony Trinitron CRT
Macintosh Color Display - Sony Trinitron CRT
Apple Basic Color Monitor (VGA) - conventional CRT

The Sony Trinitron CRT offers the advantages of a brighter and sharper raster with better convergence.

AudioVision 14 Display: Connecting the Monitor (7/93)

==========

Article Created: 29 July 1993

TOPIC ----------

This article discusses how to connect the AudioVision 14 Display to a Macintosh that:
1) Has a built-in high density connector on the computer.
2) Doesn't have the built-in high density connetor.

DISCUSSION ----------

Connecting the monitor to a computer that has a built-in high density connector:

1) Before you connect any cables, make sure that your computer is turned off.

2) Connect the connector end of the power cord to the monitor and the other end to the back of the computer.

3) If the back of your computer has the high-density connector simply connect the AudioVision cable to the high-density connector on the back of the computer.

4) You are now ready to use the monitor. You do not need to install software if your computer has a built-in high density connector. The software is already installed on the hard drive.

Connecting the monitor to a computer without a built-in high density connector:

1) Before you connect any cables, make sure that your computer is turned off.

2) Connect the connector end of the power cord to the monitor and the other end to the back of the computer.

3) If the back of your computer DOES NOT have the high-density connector, you need to use an adapter cable, a NUBUS video card and will have to install the AudioVision software. (The adapter cable kit part number is M1243LL/A.)

4) Connect the adapter cable plugs (monitor, sound in, sound out, and ADB) to the back of the computer.

5) Connect the AudioVision high-density cable to the high-density connector on the adapter cable by firmly pushing the cable into the connector until you hear a click.

6) Install the AudioVision Software that provides integrated sound and video capabilities by inserting the AudioVision Installer disk into the internal floppy disk drive.

7) Click the Installer icon and install the software on the appropriate hard disk.

8) Once installation is complete, restart you Macintosh.

AudioVision 14 Display: Description (7/93)

Revised: 7/28/93
Security: Everyone

AudioVision 14 Display: Description (7/93)

==========

Article Created: 29 July 1993

TOPIC ----------

This article describes the Apple AudioVision 14 Display.

DISCUSSION ----------

The Apple AudioVision 14 Display combines superb color graphics with a revolutionary new sound system, so you can not only work with today's multimedia applications, but also take advantage of emerging telephony, videoconferencing, and speech-recognition applications.

The first in an entirely new class of displays, the AudioVision 14 Display integrates high-quality stereo speakers, microphone, and high-contrast display into a single, sleek package. Speakers deliver CD-quality sound because they're specially engineered for near-field listening, sound clarity, and full-frequency response.

Simply speak into the display's built-in microphone when you want to add voice annotations to your documents. Or, when speech-recognition applications become available, use the microphone to dictate instructions to your computer. Some applications will even let you use the microphone as your hands-free speakerphone.

For added convenience, the AudioVision 14 comes with ports that put connections for headphones, exter-nal speakers, CD players, and any Apple Desktop Bus device right on your desktop. So it's a snap to record, listen to, or watch your favorite media.

As for display quality, expect exceptional brightness and clarity, thanks to Apple's unique electronics and the display's advanced Sony Trinitron pic-ture tube. Its fast refresh rate assures flicker-free performance, and the flat, high-contrast screen produces crystal-clear images and color, even at the edges of the screen.

..TIL12712-AudioVision_14_Display-Description_7-93.pdf

The unique integration of hardware and software makes the AudioVision 14 Display simple to use. A single cable en-ables fast, plug-and-play setup. Contrast, brightness, and sound controls are con-veniently located on the front panel. And new software controls let you cus-tomize the way the display handles sound output and input.

FEATURES

Display quality

- 14-inch screen, 640 horizontal by 480 vertical lines (at 70 dots per inch)
- Trinitron color picture tube with improved electronics for higher brightness, high contrast, and uniform color

Ergonomic features

- Tilt-and-swivel base for adjustment to comfortable viewing, speaking, and listening angles
- 66.7-hertz refresh rate and degaussing capability eliminate flicker and distortion
- Meets strict SWEDAC MPR-2 requirements for low-frequency (ELF and VLF) magnetic and electric emissions
- EPA Energy Star rating for power savings (when used with certain Macintosh models)

Audio quality

- Stereo speakers for CD-quality sound output
- Unidirectional microphone for high-quality sound input, capable of speech recognition

Ease of use and flexibility

- Plug-and-play capability with any modular Macintosh computer
- Convenient side ports for CD-ROM drives, CD or audio cassette players, headphones, external speakers, and ADB devices such as keyboard or mouse
- Software control panel for customizing sound and screen settings
- Front panel buttons for easy access to brightness, contrast, volume, mute, and microphone controls

Compatibility

- Hardware compatible with all modular Macintosh computers with on-board video support or any NuBus-capable modular Macintosh computer
- System software 7.0.1 or later

Target Customer

- Customers interested in today's multimedia applications
- Customers interested in emerging voice technology applications (speech recognition, telephony, videoconferencing, and so on)

Ordering Information

Apple AudioVision 14 Display and Adapter Bundle
• Order No. B1247LL/A
  Apple AudioVision 14 Display

AudioVision 14 Disp:Erratic Video SW Behavior (7/93)

Revised: 7/28/93
Security: Everyone

AudioVision 14 Disp:Erratic Video SW Behavior (7/93)

==========

Article Created: 29 July 1993

TOPIC --------------------

This article discusses the erratic video slider control (software controlled) behavior.

DISCUSSION --------------------

Pressing the Volume key, Mute button, or Microphone-on button in combination with the Brightness or the Contrast button makes the software slider control (in the video control panel) behave erratically.

For example, if you press and hold the top of the Contrast button to adjust the slider control upward AND press the Mute button at the same time, the slider control continues upward toward the end, even after the buttons have been released.

AudioVision 14 Display: Inaudible Boot Beep (7/93)

Revised: 7/27/93
Security: Everyone

AudioVision 14 Display: Inaudible Boot Beep (7/93)

==========

Article Created: 29 July 1993

TOPIC ----------

This article discusses the "boot beep" when you turn on the computer.

DISCUSSION ----------

If you use the AudioVision 14 Display with some Macintosh computers, you may not hear the "boot beep" when you turn on the computer. To hear the boot beep, plug the monitor into the wall (not into the computer) AND turn on the monitor before turning on the computer.

The inaudible boot beep occurs when the AudioVision's power cord is plugged into the computer AND the computer beeps before the AudioVision is fully powered up (and able to produce sound.) The inaudible beep is known to occur in the Macintosh IIvx, IIvi, Quadra 700, 800, 900 and 950.

AudioVision 14 Display: Install/Overwriting SW Tip (8/93)

Revised: 8/4/93
Security: Everyone

AudioVision 14 Display: Install/Overwriting SW Tip (8/93)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 3 August 1993

TOPIC ----------

If you use the AudioVision 14 Display with other devices that include software, such as the Apple Adjustable Keyboard or third-party ADB devices, install the AudioVision software LAST.

DISCUSSION ----------

Software for some other devices may overwrite your monitor software. For example, if you install software for the Apple Adjustable Keyboard after installing software for the AudioVision 14 Display, the keyboard's Sound control panel may replace the monitor's Sound control panel. The result is that you lose the AudioVision "Volumes" Sound control panel.

Also, with the Apple Adjustable Keyboard, follow these steps after you install the software:

1) Follow the instructions to restart
2) Turn off the computer and monitor
3) Wait 30 seconds before powering up.

If you don't follow these steps, the display won't be recognized.

Article Change History:
3 August 1993 - Added more information about installing the Apple Adjustable Keyboard.
29 July 1993 - Shortened the title

Apple AudioVision 14 Display: New Features and Benefits (7/93)

Revised: 7/28/93
Security: Everyone

Apple AudioVision 14 Display: New Features and Benefits (7/93)

==========

Article Created: 29 July 1993

TOPIC ----------

What are the new features and benefits of the AudioVision 14 Display?

DISCUSSION ----------

The AudioVision 14 Display is the basic Macintosh Color Display re-designed to include several key features for sound integration and ease of use.

NEW FEATURES	BENEFITS
Built-in stereo speakers	Two full-range stereo speakers built into the display provide high-quality sound output. A dedicated audio circuit board amplifies the sound output from the Macintosh and guarantees excellent bass response, high efficiency, and full dynamic range. The frequency response, dynamic range (100 Hz to 15kHz), signal-to-noise ratio, and lack of distortion will be comparable to some of the finer desktop speakers.
Built-in microphone	A built-in microphone, located at the top of the display’s bezel, will enable much higher quality sound capture than does the Apple microphone today. The built-in microphone is designed to support Apple's voice recognition software, PlainTalk. The microphone features the unique capability to ignore extraneous sound from the sides and back of the display. The display control panel features an LED to alert the customer that the microphone is on.
Integrated Cable	AudioVision is the first display to use a new integrated cable which offers easier plug and

	play setup for customers. This cable will replace the myriad of cables (video, ADB, sound in, sound out) that now run from the display to the CPU.
Adapter Cable	This cable adapter, "breaks out" the cables from the integrated connector and allows AudioVision to be used with Macintosh models with discrete connectors. This guarantees that every modular Macintosh owner can easily use AudioVision.
User Controls (Buttons)	Brightness, contrast, speaker volume, mute, and record controls (buttons) are located on the control panel on the front of the display between the speakers.
Side Ports	Headphone jack, external sound input, ADB (2), and video in (for hookup of camcorder, VCR, or other video input device) offers ease of use.
AudioVision Software	AudioVision software provides a common user interface by which applications can prompt the user for their AudioVision video and audio preferences (brightness, contrast, speaker volume up/down, and speaker mute). Most of the options duplicate the buttons on the front of AudioVision, however, a few preferences can be set in software that cannot be set otherwise (for example, headphone volume). The AudioVision software includes an Installer program, a sound cdev, a video cdev, and the QuickTime component manager extension.

Apple AudioVision 14 Display: Q & A (7/93)

Revised: 7/27/93
Security: Everyone

Apple AudioVision 14 Display: Q & A (7/93)

==========

Article Created: 29 July 1993

TOPIC ----------

This article addresses questions on the AudioVision 14 Display.

DISCUSSION ----------

Q: Why is incorporating sound important?
A: First, Apple has pioneered in the application of sound on personal computers since the advent of the Macintosh. This puts Apple in an excellent position to provide high quality sound output that meets the unique requirements of today’s media-rich computing environment. The Apple AudioVision 14 Display provides a complete integrated solution to computer audio output that conventional speaker systems do not.

Second, Apple believes that high-quality audio output is and will increasingly be a critical part of computing. More software than ever is incorporating CD-quality audio content, and customers are looking for ways to take advantage of the high-quality sound their computers can deliver. With AudioVision, Apple is making high-quality sound output available to all computer users.

Q: Does AudioVision only work with the new AV computers?
A: No. AudioVision will simplify and enhance the sound-in and sound-out of ANY modular Macintosh CPU.

Q: How does AudioVision differ from just adding separate high quality speakers and a high quality microphone?
A: While AudioVision's sound performance is equivalent to many highly priced speaker and microphone alternatives, the all-in-one integrated hardware and software solution offers several advantages you just can't get by adding on separate components. This integration advantage translates into simplicity of purchase and set-up, convenience in usage, and software Flexibility.

Q: What do you mean by Purchase and Set-up Simplicity?
A: With the integrated design from Apple, the whole user experience -- purchase, set-up, and usage -- is made simpler. The AudioVision solution provides a single, uncomplicated purchase option for getting high quality sound in and sound out of your Macintosh. And because it's from Apple you know it works well together. The all-in-one design also means no loose items hanging off your computer or taking up more desk space. It means fewer cables, fewer misconnections, and fewer hassles. The goal of simplicity is witnessed in the sleek and inconspicuous industrial design.

Q: What do you mean by Usage Convenience?
A: With AudioVision, touch buttons for controlling sound and screen settings are now quickly within reach. Brightness, contrast, volume, mute, and microphone controls are right on the AudioVision front panel. Furthermore, when you want to connect other peripherals (headphones, external speakers, CD-players, keyboard) to your computer, you no longer have to reach around to the back of your CPU. All these ports are now conveniently located on your display.

Q: Can you describe the features of the sound-in port?
A: There are three special features.

1) Loop Through: You can loop sound coming in from that port right out to the AudioVision speakers without going through the CPU. Sounds from the CPU will be mixed in automatically. Since most Macintosh CPU's can't process CD-quality sound, this is a big win. In fact, your computer could be turned off and you could still use the AudioVision speakers.

2) Flexible sound-in options: Macintosh computers only have one sound-in port. The AudioVision sound-in port, however, gives you an easy way of swapping between two inputs. For example, you may want to digitize music from a CD player, but when the phone rings you want to use AudioVision as a hands-free speakerphone. With AudioVision you can do both without any plugging and un-plugging. When you want to use the internal microphone, you simply hit the microphone enable button and internal microphone will cut over. Without AudioVision and its alternative sound-in port, you'd have to manually plug and unplug different sound-in devices from the back of your CPU.

3) Built-in pre-amp saves you power and money: For special recordings you may want to plug in a professional stereo microphone. Such a microphone usually requires extra power, but not with AudioVision. AudioVision's built-in pre-amp supplies this power to the microphone. CPU's do not.

Q: What do you mean by Software Control & Flexibility?
A: AudioVision software allows the user to customize their own sound and screen settings.

Q: How does AudioVision differ from the Macintosh Color Display?
A: AudioVision provides the exact same high quality video characteristics as the Macintosh Color Display, plus new sound functionality and

convenience.

Q: What is the Integrated Desktop Cable (IDC)?
A: It's a new high-density cable for plug-and-play set-up. The IDC replaces five cables that would normally have to run from your computer to your display to provide the same AudioVision functionality (sound-in, sound-out, ADB, video-in, video-out). Now with a single "snap" you'll be connected.

Q: When do I need the AudioVision Adapter?
A: It is required on all modular Macintosh models that do not have the high-density connector on the back panel of the computer. The part number is M1243LL/A. Future Apple CPU's will support the new integrated desktop cable and, therefore, will not require the AudioVision adapter.

Q: Why do you refer to the AudioVision as a 14-inch Display?
A: As with the Macintosh Color Display, Apple adopted the 14" specification because most vendors offering monitors with the 640 x 480 pixel viewing area have standardized on the 14" measurement, which actually measures tube size. Whether it's called 13" or 14" doesn't really matter. What does matter is the number of pixels. We've simply tried to conform to the industry norm in order to allow customers to compare monitors accurately.

Q: What does the AudioVision software do?
A: The AudioVision software provides integrated sound and video capabilities that allow you to take advantage of multi-media and voice technology applications.

Q: Who is the target audience?
A: The AudioVision is for customers interested in today's multimedia applications and customers interested in emerging voice technology applications (speech recognition, telephony, videoconferencing, and so on.)

Q: Who makes the speakers?
A: Apple has more than one supplier that meet the very strict proprietary Apple designs.

Q: Does this display conform to low emissions standards?
A: Yes, the Macintosh Color Display is fully compliant with the world's strictest guidelines for magnetic emissions, as are all Apple Macintosh color displays. The Macintosh Color Display along with Apple's 21-inch display are among the only displays in the industry that currently conform with both magnetic and electric ELF/VLF emissions standards, in accordance with SWEDAC MPR-2.

Q: Does this display meet the EPA's Energy Star requirement?
A: Yes. Both the Macintosh Color Display and the Apple AudioVision 14 Display meet the EPA's requirement for power savings when they are used with certain CPU's.

AudioVision 14 Display: Set Up Tips For Speech Recog (5/94)

Revised: 5/3/94
Security: Everyone

AudioVision 14 Display: Set Up Tips For Speech Recog (5/94)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 3 May 1994

TOPIC ----------

This article gives set up and troubleshooting tips for the AudioVision 14 Display in regards to speech recognition with the Centris, Quadra, and Power Macintosh AV series computers.

DISCUSSION ----------

The AudioVision 14 Display is compatible with the Centris, Quadra, and Power Macintosh AV series computers, including speech recognition. During monitor set up, two steps are important for speech recognition.

1) When connecting the AudioVision adapter cable, connect the sound-in plug to the external sound input port on the back of the computer.

2) Make sure the AudioVision's built-in microphone is turned on.

Note: The built-in microphone at the top of the display is not as sensitive as the external microphone input on the side of the display.

Troubleshooting Tips

- If speech recognition is not working properly, check the sound input options in the Sound Control Panel. The computer may be looking for sound from the wrong input port.

  If the display is connected to the 45-pin monitor port on the computer, follow these steps:

  1) Open the Sound Control Panel
  2) Choose the Sound In option from the menu in the control panel window.

3) Click on Options
4) Change the input source to AV Connector

If the display is connected to the 15-pin monitor port on the computer and the sound cables are attached to the microphone input and output ports using the AudioVision adapter cable, follow these steps:

1) Open the Sound Control Panel
2) Choose the Sound In option from the menu in the control panel window
3) Click on Options
4) Change the input source to Microphone

- Make sure the microphone is on by pressing the microphone switch on the front of the display until the amber light above the switch is on.

- The Sound In options are ways of choosing the port you want to record sound from. If the monitor is plugged into the microphone jack, you want sound coming from the microphone. If the monitor is plugged into the HD-45 connector (AV Connector), you want to choose that port. The pictures in the control panel can be misleading since they depict the type of microphone or device and not the port you are recording from. The microphone picture is for the mini-stereo sound input port, the AV microphone picture is for the AV Monitor Connector, and the CD is for a CD drive.

AudioVision 14 Display: Using the Turbo Mouse (7/93)

Revised: 7/27/93
Security: Everyone

AudioVision 14 Display: Using the Turbo Mouse (7/93)

==========

Article Created: 29 July 1993

TOPIC ----------

This article discusses using the Turbo Mouse with the AudioVision 14 Display

DISCUSSION ----------

If you use the AudioVision 14 Display with the Turbo Mouse, the mouse will not work if it is plugged into the ADB port on the monitor. You MUST plug the Turbo Mouse into the back of the computer. If your computer has only one ADB port, you'll need to buy a Y-adapter cable to accommodate both the mouse and the ADB plug on the AudioVision adapter cable.

Apple AudioVision 14 Display: Technical Specifications (7/93)

==========

Article Created: 30 July 1993

TOPIC -----

This article gives the technical specifications for the AudioVision 14 Display.

DISCUSSION -----

Picture Tube

- 14-inch diagonal, 13-in. viewable, Trinitron CRT
- .26-mm stripe pitch
- High-contrast glass

Video

- Resolution: 640 horizontal pixels by 480 vertical lines
- 70 dpi
- Active display area: Adjusted at the factory to produce an active video area described by an ideal rectangle of 9.3 x 6.9 inches (235 by 176 mm)

Input Signals

- Red, green, and blue video signals, negative-going TTL

Scanning and Refresh rates

- 35.0-kHz horizontal scan rate
- 66.7-Hz vertical refresh rate

Microphone

- Directional, optimized for use in speech-recognition and voice-capable applications

Speakers

- Full-range stereo
- Tuned port, bass reflex chamber design
- Maximum loudness: 90-dB sound pressure level (SPL) at 1 kHz at 0.5m
- Frequency response: 100 Hz to 15 kHz +/-3 dB

User controls

- Contrast, brightness, mute, volume, and microphone

Built-in ports

- One stereo line/microphone input port
- One stereo headphone/speaker output port
- One video-in port (for future use)
- Two Apple Desktop Bus ports

Audio input signals

- Accepts audio signal of up to 6 Vpp (line level: low sensitivity) or as low as 20 mVpp (microphone level: high sensitivity)

Headphone jack

- Output level: 1.75 Vpp into 4-W load and 2 Vpp into 10-kW load

Operating environment

- Temperature: 50° F to 104° F (10° to 40° C)
- Humidity: 90% maximum, noncondensing
- Altitude: 0 to 10,000 feet (0 to 3,048 m)

Electrical requirements

- Voltage: 100 to 240 Vrms
- Frequency: 47 to 63 Hz
- Power consumption: 37 W normal operation, 55 W maximum

Physical Measurements

- Height: 15.2 inches (38.5 cm)
- Width: 13.4 inches (34 cm)
- Depth: 16.6 inches (42 cm)
- Weight: 33 pounds (15 kg)

System requirements

- Compatible with modular Macintosh computers with on-board video support or any NuBus-capable modular Macintosh computer
- System software version 7.0.1 or later

Macintosh Finder: Rate of Directory Structure Updates (7/93)

Revised: 8/2/93
Security: Everyone

Macintosh Finder: Rate of Directory Structure Updates (7/93)

==========

Article Created: 28 July 1993

TOPIC ----------

How often is the directory information updated?

I moved files from one folder to another, and then ran an application that crashed. When I restarted, all of the files were back in the original folder.

Is there a way to force the directory information to be updated by a particular Finder event (like duplicating a file) without restarting, shutting down, or rebuilding the desktop?

DISCUSSION ----------

There isn't a simple answer to how often the directory information is updated. Updates don't happen at regular intervals.

When files are moved, causing the directory structure to change, the affected blocks of the catalog are read into the cache and marked dirty. The changes to the directory structure are then made in RAM (to what was read into the cache).

It's only when a FlushVol is performed that the information is written out to the volume in question. If the system crashes before the FlushVol occurs, then the directory will be in its prior state. In this case, no actual damage has occurred, although the user's actions of moving the file have been lost. Of course, when crashes occur regularly, it's a good idea to verify the integrity of your data frequently.

There's no easy answer to the question of how often a FlushVol occurs, as there's no predetermined rate at which they occur. Given normal operation of a computer, this shouldn't be an issue. The problem only arises when a crash occurs.

HD SC Setup 7.2: Fixes HFS Extents File Bug (8/93)

Revised: 8/26/93
Security: Everyone

HD SC Setup 7.2: Fixes HFS Extents File Bug (8/93)

==========

Article Created: 28 July 1993
Article Reviewed/Updated: 26 August 1993

TOPIC ----------

Is it true that Apple HD SC Setup 7.2 (included with the Hardware System Update 2.0 disk and the Software Utility Update 1.0 disk) fixes the HFS Extents file bug that came to light with PowerBook 120MB drives.

DISCUSSION ----------

HD SC Setup 7.2 does indeed resolve the Extents file bug. To update, follow the procedure below:

1) Launch Disk First Aid 7.1.1 or higher. (Disk First Aid 7.2 is shipped on the Software Utility Update 1.0 disk.)

2) Select the disk you wish to update.

3) Click the Start button (for Disk First Aid 7.2, click Verify.) Disk First Aid will inform you if any repairs are needed.

4) If repairs are needed, click the Repair button.

5) Repeat steps 2 through 4 for any additional hard disks you wish to update.

6) Quit Disk First Aid.

7) Launch HD SC Setup 7.2 or higher.*

8) Click the drive button to select the hard disk you wish to update.

9) Click the Update button. This installs the new version of the SCSI driver.

10) Repeat Steps 2 and 3 for any additional hard disks you wish to update.

11) Click the Quit button to return to the Finder.

*Notes: - Make sure that Disk First Aid and HD SC Setup is not running from any hard disk you wish to update.
- Make sure that none of the hard disk(s) you wish to update is the startup disk.)

Article Change History:
26 August 1993 - Revised article to include proper procedure of running Disk First Aid first, then HD SC Setup. Retitled article to refer to HD SC Setup, which performs the fix.

LaserWriter Pro 600 and 630: Maintenance Intervals (7/93)

Revised: 7/28/93
Security: Everyone

LaserWriter Pro 600 and 630: Maintenance Intervals (7/93)

==========

Article Created: 28 July 1993

TOPIC ----------

Are there any parts or modules that should be replaced at regular intervals to maintain optimal print quality on the LaserWriter Pro 600 and 630?

DISCUSSION ----------

There is no refurbishment kit currently available for the LaserWriter Pro 600 and 630, however, several parts should be replaced at regular intervals if a deterioration in print quality or paper handling is noticed. Use the table below as a guide for determining when the consumable parts should be replaced.

Description	Part Number	Expected Life
Fuser assembly	661-0802 (110/115V)	200,000 pages
	661-0803 (220/240V)	200,000 pages
Multi-purpose pickup roller	922-0281	200,000 pages
Cassette pickup roller	922-0280	200,000 pages
Separation pad	922-0286*	200,000 pages
Transfer roller	922-0205	200,000 pages
Fan	922-0202	25,000 hours

* The separation pad is included with the multipurpose tray guide assembly.

GeoPort Telecom Adapter: Description (11/95)

Revised: 11/3/95
Security: Everyone

GeoPort Telecom Adapter: Description (11/95)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 3 November 1995

TOPIC ----------

This article describes the GeoPort Telecom Adapter.

DISCUSSION ----------

OVERVIEW
========

GeoPort is a hardware and software communications architecture that has been optimized for computer-telephony integration. It has three main attributes:

• It lets any GeoPort capable computer connect to any telephone (analog or digital, public or private), anywhere in the world. This means that users can connect not just to POTS (analog) lines, but also to the PBX lines typically found in most office environments. Note, the Telecom Adapter does not support digital phone systems, only analog.

• Once connected, it supports an arbitrary number of independent data streams up to a total bandwidth of 2MB/second.

• Unlike traditional asynchronous data communications (such as AppleTalk), GeoPort also supports isochronous data streams (such as real-time data like voice and video), and provides the real-time Application Program Interfaces (APIs) necessary to hide the implementation details (such as which DSP and real-time OS) from both the recipient and the sender of the real-time data.

Examples of Use -- Telephone Applications

• Auto dialing from within an application

• Auto call logging and tracking for account billing purposes

- Call screening and filtering (send some calls directly to voice mail)
- Send and receive a fax over a digital (PBX) line
- Voice and video conferencing -- with multiple users
- One phone number for voice mail, fax, or data connection
- Remote retrieval of email, voice mail, and fax -- from any telephone in the world
- Low cost fax-back machine
- Simultaneous voice and data, using any protocol (such as VoiceSpan or Radish)
- Software upgradeable "modem"
- Echo-canceled speaker phone

THE GEOPORT TELECOM ADAPTER

The GeoPort Telecom Adapter gives you access to one of your Macintosh Quadra 660AV, Quadra 840AV, and Power Macintosh family, except the Power Macintosh 5200/75 LC, Performa 5200 and 6200 (6200 in Europe only), built-in features: a 14.4 kbps (kilo bits per second) modem that uses the GeoPort technology and which includes fax send and receive capabilities.

The GeoPort Telecom Adapter serves as a line interface to standard (analog) telephone lines, and combined with the Quadra 660AV and Quadra 840AV computers' on-board Digital Signal Processor (DSP), it is capable of sending or receiving data at up 14.4 kbps and faxes at up to 9600 bps (bits per second) utilizing the bundled Apple Express Modem/Fax software. The DSP is part of the PowerPC chip itself.

The Apple Express Modem and Express Fax Software is included with the GeoPort Telecom Adapter and supports the same interfaces currently used in conjunction with the PowerBook Express modems. The data/fax transmission standards supported by the GeoPort architecture are listed below.

Data/Fax Transmission Standards Supported*

- Command Set

Extended Hayes AT command set

Begin_Table

- Data communications standards

14400	CCITT V.32 bis
9600, 4800 bps	CCITT V.32
2400 bps	CCITT V.22 bis
1200 bps	Bell 212A

1200 bps CCITT V.22
300 bps CCITT V.21
300 bps Bell 103

• Group 3 Fax communications standards
2400, 4800 bps CCITT V.27 ter
7200, 9600 bps CCITT V.29

End_Table

• Error control
Full CCITT V.42 compliance
MNP Classes 2-4

• Data compression
CCITT V.42 bis (up to 4:1 compression)
MNP Class 5 (up to 2:1 compression)

NOTE: The preceding standards are supported by the GeoPort architecture built into the Macintosh Quadra 660AV, Quadra 840AV, and Power Macintosh except the Power Macintosh 5200/75 LC, Performa 5200 and 6200 (6200 in Europe only).

What's in the box

The GeoPort Telecom Adapter, "Getting Started With Your GeoPort Telecom Adapter" manual, the "Express Fax/Modem User's Guide", a length of telephone cord, and a floppy disk containing the Express Modem/Fax software.

Adapter Models

This table lists the ordering information for GeoPort adapter models, which systems to use them with, and which versions to use outside the United States:

Begin_Table

Model	System	International
M1694LL/A	Quadra 660 AV and 840 AV	NO
M1694LL/B	Quadra 660 AV and 840 AV	YES
M3127LL/A	Power Macintosh	YES

End_Table

Part numbers mentioned in this article are accurate as of this writing. Before ordering, verify that they are still correct as they are subject to change.

This article was published in the "Information Alley": Volume I, Issue 10.

Article Change History:
03 Nov 1995 - Added GeoPort capable to second paragraph.
26 Sep 1995 - Added that Telecom Adapter does not support digital systems.
07 Jun 1995 - Added information on Power Macintosh 5200/75 LC.

GeoPort Telecom Adapter: Specifications (10/94)

Revised: 10/24/94
Security: Everyone

GeoPort Telecom Adapter: Specifications (10/94)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 20 October 1994

TOPIC ----------

This article gives the technical specifications of the GeoPort Telecom Adapter used with the Macintosh Centris 660AV and Quadra 840AV and Power Macintosh computers.

DISCUSSION ----------

Overview

The GeoPort Telecom Adapter gives you access to one of your Macintosh Quadra 660AV, Quadra 840AV, and Power Macintosh family built-in features: a 14.4 kbps (kilo bits per second) modem with fax send and receive capabilities.

The GeoPort Telecom Adapter serves as a line interface to standard (analog) telephone lines, and combined with the Quadra 660AV and Quadra 840's on-board DSP, (Digital Signal Processor) it is capable of sending or receiving data at up 14.4 kbps and faxes at up 9600 bps (bits per second) utilizing the bundled Apple Express Modem/Fax software. The DSP is part of the PowerPC chip itself.

The Apple Express Modem and Express Fax Software is included with the GeoPort Telecom Adapter, supports the same interfaces currently used in conjunction with the PowerBook Express modems. The data/fax transmission standards supported by the GeoPort architecture are listed below.

Data/Fax Transmission Standards Supported*

- Command Set
  Extended Hayes AT command set

- Data communications standards
  14400 CCITT V.32 bis
  9600, 4800 bps CCITT V.32

2400 bps	CCITT V.22 bis
1200 bps	Bell 212A
1200 bps	CCITT V.22
300 bps	CCITT V.21
300 bps	Bell 103

- Group 3 Fax communications standards

2400, 4800 bps	CCITT V.27 ter
7200, 9600 bps	CCITT V.29

- Error control
  - Full CCITT V.42 compliance
  - MNP Classes 2-4

- Data compression
  - CCITT V.42 bis (up to 4:1 compression)
  - MNP Class 5 (up to 2:1 compression)

* These standards are supported by the GeoPort architecture built into the Macintosh Quadra 660AV, Quadra 840AV, and Power Macintosh.

Software Supported*

Express Modem Software
Express Fax Software

* The Express Modem and Fax software is included with the GeoPort Telecom Adapter

Electrical Requirements

- Operating voltage: 5 Volts, plus or minus 5 percent at less than or equal to 500 milliamps.
- The adapter is powered using the GeoPort/Modem port, via an extra pin. No separate power supply or battery is required.

Size

- Height: 1.57 inches (4 cm)
- Width: 2.8 inches (7.1 cm)
- Length: 5.6 inches (14.3 cm)

Operating Environment

- Operating temperature: 50 degrees to 104 degrees F (10 degrees to 40 degrees C)
- Storage temperature: -40 degrees to 149 degrees F (-40 degrees to 65 degrees C)
- Relative humidity: 20% to 90% noncondensing at a temperature range of 77 degrees to 104 degrees F (25 degrees to 40 degrees C)
- Maximum altitude: 7703 ft. (2135 m)

What's in the box:

- GeoPort Telecom Adapter
- Getting Started With Your GeoPort Telecom Adapter manual
- Express Fax/Modem User's Guide
- Telephone cord
- Floppy disk containing the Express Modem/Fax software

Ordering Information:

M1694LL/B - GeoPort Telecom Adapter for Quadra 660 AV and Quadra 840 AV.
M3127LL/A - GeoPort Telecom Adapter for Power Macintosh and International Use.

Article Change History:
20 Oct 1994 - Revised transmission data and added package contents.
09 Aug 1993 - Updated with correct transmission speed data.

Macintosh: Composite SIMMs Not Recommended (8/93)

Revised: 8/26/93
Security: Everyone

Macintosh: Composite SIMMs Not Recommended (8/93)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 17 August 1993

TOPIC ----------

Can I use composite 72-pin SIMMs in my Macintosh?

DISCUSSION ----------

Apple does not recommend or support composite SIMMs in any Macintosh model which uses 72-pin SIMMs. Although composite SIMMs are less expensive than standard 72-pin SIMMs, Apple cannot guarantee reliability or performance when composite SIMMs are installed. Instead, Apple recommends using 16 megabit chip SIMMs.

Composite SIMMs are SIMMs manufactured using a smaller or older memory technology. An example of this would be a 16MB SIMM made of rows of 4MB chips--basically a 16MB SIMM made of 4 4MB SIMMs on one board.

Some reasons why composite SIMMs are not supported include:
- Physically, they may not fit on the logic board.
- Their timing may not be compatible.
- Loading on new SIMMs may cause problems (when booting, the computer may display a sad Mac icon and play a series of tones).

Article Change History:
17 August 1993 - Added more detail about composite SIMMs.

Macintosh AV Series: QuickTime Information (12/93)

Revised: 12/23/93
Security: Everyone

Macintosh AV Series: QuickTime Information (12/93)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 23 December 1993

TOPIC ----------

I understand that QuickTime 1.5 is in ROM on the Centris 660AV, Quadra 660AV and Quadra 840AV, but when I check the version by performing a "Get Info", it states version 1.6.1 Can you explain this?

DISCUSSION ----------

QuickTime 1.6 was released after the final production of the Centris 660AV, Quadra 660AV and Quadra 840AV ROM's. Software version 1.6.1 of QuickTime was installed at the factory. The newer version of QuickTime will override the version in ROM.

QuickTime 1.6 provides a smaller memory footprint when not in use and supports converting audio tracks on CD's (with AppleCD 300) directly into QuickTime movies as well as Macintosh Easy Open* support and better 4 bit gray scale dithering. Performance is also improved with faster Photo CD decompression, and smoother movie playback.

* Macintosh Easy Open is part of the "Macintosh Easy Open Developer's Kit" which is essentially an extension to System 7 and a translation manager application programming interface (API). It allows opening and converting of documents even though the applications that created the files aren't available.

Article Change History:
23 December 1993 - Revised article to include all AV Series info.

Centris 660AV & Quadra 840AV: 2MB ROM Information (7/93)

Revised: 7/28/93
Security: Everyone

Centris 660AV & Quadra 840AV: 2MB ROM Information (7/93)

==========

Article Created: 29 July 1993

TOPIC ----------

This article provides information on the new 2MB ROM in the Centris 660AV and Quadra 840AV.

DISCUSSION ----------

The Centris 660AV and Quadra 840AV are the first Macintosh computers to implement a 2MB ROM using two 512Kx16 chips. The new ROM is also the first ROM that contains code for portions of System 7 that were able to be moved to the ROM, freeing up RAM for applications and other system use.

The ROM has also been vectorized which allows for easier System patch creation and from a development perspective is much easier to maintain.

The new ROM also includes:

- Support for the Digital Signal Processor (DSP)
- New drivers for DMA based LocalTalk, Ethernet, Floppy disk, and SCSI
- QuickTime 1.5*
- Sound Manager 3.0
- Video input and output drivers
- Speech recognition and text to speech driver
- Apple Events and AppleScript
- Software support for telecom capabilities

* QuickTime 1.5 is installed in ROM, however, the software version of QuickTime 1.6 was installed at the factory and will override the version in ROM.

GeoPort Telecommunications Architecture (8/95)

Revised: 8/23/95
Security: Everyone

GeoPort Telecommunications Architecture (8/95)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 23 August 1995

TOPIC ----------

This article provides a description of the GeoPort Telecommunications Architecture which is found on the following: Quadra 660AV, 840AV, and all Power Macintosh computers except 5200/75LC and Performa 5200 and 6200 series.

DISCUSSION ----------

GeoPort provides the enabling software and hardware technologies that provide easy access to telephony services. Once the appropriate telephony connection has been established with the correct adapter, feature enhancements (OCR capability, FAX send/receive, voice messaging, and so on), can be provided by just adding software.

Third party developers can take advantage of the GeoPort architecture designed into the hardware and software of the computers mentioned above by writing a variety of drivers, tools, and applications in order to provide desired services.

A GeoPort Telecom Adapter, made by Apple, is a simple low cost device that contains a serial communications chip and either a codec (analog and PBX) or digital interface chip (ISDN and PBX) that sits between the 9-pin Modem/Geoport port on the computers mentioned above and the telephone jack. The internal logic of the adapter will differ depending on the particular telephone system it was designed for. The GeoPort Telecom Adapter will connect to standard analog telephone lines. For more information on this adapter, search the Tech Info Library on "GeoPort".

Apple is currently working with third-parties to provide a PBX and a ISDN GeoPort Adapter which should be available in the future. These products will not come from Apple, but from third-parties.

Article Change History:
23 Aug 1995 - Updated for Power Macintosh computers.
30 Jun 1995 - Reviewed and made changes for clarity.

PlainTalk: Description of Apple's Speech Recognition Technology

Revised: 7/28/93
Security: Everyone

PlainTalk: Description of Apple's Speech Recognition Technology

==========

Article Created: 29 July 1993

TOPIC ----------

This article provides a description of PlainTalk (Apple's implementation of speech recognition technology).

DISCUSSION ----------

With PlainTalk on the Quadra 840AV and Centris 660AV, Apple is introducing the first personal computers that seamlessly integrate Speech Recognition and Text To Speech technologies. PlainTalk is the speech component of the Audio/Visual Technology suite. For more information on this technology, search the Tech Info Library on "AV Technology".

Speech Recognition

The Speech Recognition component of PlainTalk is based on the Casper technology. It is a continuous-speech system that is independent of the person speaking.

Speech Recognition enables a whole new user experience whereby users will be able to streamline operations by simply invoking commands or complex macros by speaking them.

Text to Speech

Text to Speech gives the computer the ability of reading text based information and synthesizing speech via the computer's speaker.

Multiple voices at various sound quality levels are supported.

This enables new capabilities such as audible proof reading or in combination with the telephony capabilities that GeoPort provides to listen to your E-mail messages from remote locations.

Writing speech commands is accomplished through two different methods:

• AppleEvent enabled applications commands are written using AppleScript.

• Non-AppleEvent enabled applications will use a new version of QuickKeys from CE Software that will support spoken Commands.

Macintosh Quadra 840AV: Specifications (7/93)

Revised: 8/13/93
Security: Everyone

Macintosh Quadra 840AV: Specifications (7/93)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 9 August 1993

TOPIC ----------

This article gives the technical specifications for the Macintosh Quadra 840AV computer.

DISCUSSION ----------

Microprocessor

- Motorola 68040, 32-bit architecture, 40 Mhz clock speed
- Integrated floating-point unit (FPU)
- Paged Memory Management Unit (PMMU)
- 8 KB Cache

Digital signal processor (DSP)

- AT&T 3210 running at 66.67 Mhz
- Used for sound, speech recognition, telecommunications, and other real-time processing tasks

Memory

- 8 MB of RAM standard (varies depending on model ordered).
- Four memory expansion slots for 60ns 72-pin SIMMs. Supported SIMM sizes are 4,8,16,and 32 MB.
- Expandable to 128 MB of RAM by using 32 MB SIMMs in each of the four SIMM slots. (Note: Dealer Installation Required).
- 256 bytes of non-volatile parameter memory (PRAM).
- 2 MB ROM (Two 512k by 16 chips).

Disk Drives

- One Built-in Apple SuperDrive 1.4MB floppy disk drive that uses

high-density floppy disks and reads, writes, and formats Macintosh, MS-DOS, OS/2, and ProDOS disks.
- Support for three internal SCSI devices, two of which may be used for removable media such as an internal CD-ROM drive. One of the internal SCSI devices may be a full height drive or a drive array. (230 MB, 500 MB, and 1 GIG options available).
- Optional internal Apple CD-ROM drive (see above).
- Optional external SCSI hard disk drive (many capacities available).

Video Display

- Supports all Apple displays up to 21 inches.
- Supports some other non-Apple monitors, including VGA, SVGA, NTSC, and PAL 19" monitors.

Video RAM

- 1 MB VRAM expandable to 2 MB. Upgrading VRAM to 2 MB permits 24 bit display (millions) on monitors up to 16-in. and 16 bit (thousands) on 21-in. color monitor.
- Four memory expansion slots for 80ns 256K SIMMs.
- VRAM is shared between graphics window and video window.
- Maximum video window size at a color depth of 16 bits is 640 X 480.

Interfaces

- Three internal NuBus expansion slots, including one with a digital-audio video connector (DAV)
- One Apple Desktop Bus (ADB) port, supporting a keyboard, mouse, and other devices
- AAUI-15 Ethernet connector
- Two serial (RS-232/RS-422) ports (Printer & Modem/GeoPort).
- Two S-Video ports, one each for input and output.
- Two composite video ports, one each for input and output.
- SCSI interface for connecting up to a total of seven SCSI devices.
- Sound-out port for stereo playback from CDs or Macintosh audio applications
- Stereo sound-input port (supports 16-bit stereo audio)
- One monitor out port.

Networking

- Built-in Ethernet
- Serial port for AppleTalk
- Integrated GeoPort telecommunications architecture for data, fax, and voice connectivity.

Sound Generator

- DSP-based 16 bit stereo audio
- Sample rates: 8 Khz to 48 Khz

Keyboard

- Several Apple Desktop Bus keyboards with numeric keypads available.

Mouse

- Apple Desktop Bus Mouse II; mechanical tracking, optical shaft, or contact encoding.

Clock/Calendar

- Custom integrated circuit with long-life lithium battery.

Apple PlainTalk Microphone

- The microphone is unidirectional and optimized for use with speech recognition. (Microphone bundled with all units sold in the USA, available as a separate item outside the USA.)

Disability Access

- CloseView, Easy Access, and visible beep included with system software. These built-in features and third-party options provide alternative input and output tools for people with disabilities.

Electrical Requirements

- Line voltage: 100 to 240 VAC, RMS single phase, automatically configured.
- Frequency: 50 to 60 Hz, single phase
- Power: 200 watts maximum, not including monitor power

ADB Power Requirements

- Maximum current draw for all ADB devices: 500 milliamps (a maximum of three Apple Desktop Bus devices is recommended)
- Mouse draws 10 milliamps.
- Keyboard draws 25 to 80 milliamps, depending on the keyboard model used.

Size and Weight

Main unit

- Height 14.25 inches (30.6 cm)
- Width 7.75 inches (19.7 cm)
- Depth 16.0 inches (39.6 cm)
- Weight* 24 pounds (10.9 kg)

* Weight varies based on internal devices installed.

Mouse

- Height 1.3 inches (33 mm)
- Width 2.4 inches (61.7 mm)

- Depth 4.2 inches (107.3 mm)
- Weight 4 ounces (0.10 kg)

Operating Environment

- Operating temperature: 50 degrees to 104 degrees F (10 degrees to 40 degrees C)
- Storage temperature: -40 degrees to 116.6 degrees F (-40 degrees to 47 degrees C)
- Relative humidity: 5% to 95 non condensing
- Maximum altitude: 10,000 ft. (3,048m)

System Software Requirements

- Requires System 7.1 or later and the System Enabler 088.

Article Change History:
9 August 1993 - added VRAM SIMM specifications
30 July 1993 - added correct name of System Enabler.

Copyright 1993, Apple Computer, Inc.

Article Reviewed/Updated: 14 December 1993

TOPIC ----------

This article describes the video features of the Macintosh AV Series computers and their video subsystem.

DISCUSSION ----------

New Video Features of the Macintosh AV Series

Composite and S-video output is supported directly from the logic board. This allows the Centris 660AV, Quadra 660AV and Quadra 840AV to connect directly to presentation equipment, televisions, or a VCR. NTSC and PAL video formats are supported.

Video and graphic acceleration and manipulation is enhanced by the inclusion of a new Digital Audio Visual (DAV) connector. This permits NuBus cards that have DAV connectors to manipulate audio and video signal directly from the main logic board.

Composite and S-video input can be connected directly to the Centris 660AV, Quadra 660AV and Quadra 840AV and can display and process this information in a separate video window. NTSC, PAL, and SECAM formats are supported.

Video Subsystem

DAV

The Digital Audio Video (DAV) connector is a 40 pin DAV connector that lines up with one of the NuBus slots in the Quadra 840AV. It is included as an option when customers purchase the NuBus adapter card for the Centris 660AV and Quadra 660AV. This connector provides access to the video input signals directly from the logic board in a YUV 4:2:2 format and to the digital audio signal input for the Singer CODEC.

This connector allows 3rd party NuBus card developers to access components on the 840AV logic board for audio and video compression, which eliminates the need for redundant components on the card and allows the customer the choice of compression technologies : e.g., MPEG, JPEG, DVI, or H.261 (videoconferencing).

Macintosh Universal NuBus Interface (MUNI)

Supports the full range of NuBus master/slave transactions with single or block moves, including dumps and runs in which the main processor is master and the NuBus is slave , supports faster data transfer rates to and from the CPU bus, and supports NuBus 90 data transfers between cards at a clock rate of 20 MHz.

NOTE: the MUNI is located on the main logic board in the Quadra 840AV and on the optional NuBus adapter card for the Centris 660AV and Quadra 660AV.

Two different Frame Buffers

The Macintosh AV Series computers are the first Macintosh computers to use two different frame buffers. These are the graphics frame buffer, and the video frame buffer. VRAM can be used in two different ways, either used completely by the graphics frame buffer (standard Macintosh display), or split 50/50 between the graphics frame buffer and the video frame buffer.

For example, A Quadra 840AV with 2MB of VRAM can support a 14-inch color monitor at 24-bits in a strictly graphic environment or can provide support for a 16-bit graphics window and a 16-bit video window.

The video subsystem digitizes video input and coverts the image to YUV format which is available at the Digital Audio/Video expansion adapter (DAV Connector). This provides expansion for our third party developers to develop NuBus cards for video compression and decompression, acceleration, image enhancements, etc.

Cyclone Integrated Video Interface Controller (CIVIC)

Manages VRAM; controls data transfer between VRAM, the VDC and Sebastian; provides 32-bit or 64-bit data paths between VRAM and the main processor or aslot card; peforms convolution; provides needed video timing signals; and generates the vertical blanking and video- in interrupt signals.

Video Data Path Chip (VDC)

Performs input video window scaling with horizontal and vertical filtering, accepts YUV 4:2:2 color-encoded input from the Digital Multistandard Decoder or the DAV slot card bus, and produces 16-bit 1:5:5:5 RGB, 8-bit grayscale, or YUV 4:2:2 output.

Sebastian

Sebastian - A video color palette and video digital-to-analog converter

(DAC). It accepts up to 64 bits of digital input, either as one 64-bit port or as two 32-bit ports. Lets one 32-bit port handle digital video while the other processes graphics using the same or different color lookup tables. Supports mixing video with still graphics, uses a convolution filter to minimize flicker in line-interlaced displays, and supports displays with clock speeds up to 100 MHz.

Mickey

Accepts analog video signals from Sebastian, provides the encoding to NTSC or PAL digital formats, and produces S-video, composite, and RGB video outputs.

66 MHZ AT&T DSP3210

This processor is a 32-bit floating point processor that provides real-time processing of modem signals, video, sound, and speech recognition data which releases the 68040 from these tasks.

Video In

The video-in capabilities of the Quadra 840AV support full-motion, full-screen viewing of any video material in the NTSC, PAL, or SECAM format.

The video subsystem is completely independant of the CPU or DSP. One of the features provided by this subsystem is the ability to record a quarter screen* image at 10 to 20 frames per second directly to a hard disk in real-time without data compression.

Video-in provides for on-screen viewing of video materials, 24 bit frame capture, and QuickTime movie recording without additional hardware.

* Quarter Screen defintions: There are two competing definitions of a one-quarter size screen, assuming the standard Macintosh 640 x 480 screen. These two definitions are often used interchangeably:

1) The actual number of pixels on the screen divided by 4, equaling 320 x 240 pixels. This is one-quarter of the standard Macintosh 640 x 480 screen and what the QuickTime development team refers to as a one-quarter size screen.

2) The horizontal number of pixels divided by 4, and the vertical number of pixels divided by 4, equaling 160 x 120 pixels. This is one-eighth of the standard Macintosh 640 x 480 screen and what the VideoFusion application (bundled with the Macintosh AV Series) refers as a one-quarter size screen.

Video Out

The Quadra 840AV provides standard video output in both the NTSC and PAL formats. This allows you to send the video output directly to standard video inputs such as those on TV monitors, VCR's, etc.

The Quadra 840AV also supports convolution, 7 levels of transparency for

blending video and graphics and Chroma-keying.

Article Change History:
14 December 1993 - Retitled and revised article to incorporate entire Macintosh AV series.
12 August 1993 - Revised the Video In portion, adding accurate video capture frame rates and defintion of quarter size screens.

Macintosh Quadra 840AV: Description (8/93)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 27 August 1993

TOPIC ----------

This article describes the Macintosh Quadra 840AV, one of the two new Macintoshes incorporating the AV Technologies in a high performance form factor.

DISCUSSION ----------

Overview

To put it simply, the Apple Macintosh Quadra 840AV computer is the most powerful, feature-rich system Apple has ever built. With an innovative architecture that delivers exciting new capabilities in telecommunications, video, and speech, the Macintosh Quadra 840AV helps you communicate more effectively than ever before.

The Macintosh Quadra 840AV combines the raw horsepower of a 40-megahertz 68040 microprocessor with a 66-megahertz digital signal processor (DSP) to achieve outstanding performance. The DSP handles telecommunications, speech, and audio functions, allowing the 68040 processor to perform other tasks, thereby increasing the total system performance.

The exceptional power and built-in features of the Macintosh Quadra 840AV let you take full advantage of exciting new audio-visual technologies. For example, with its built-in GeoPort telecommunications architecture, the Macintosh Quadra 840AV can be connected with telephone systems, so you can use your computer as a telephone, an answering machine, a fax machine, and an electronic mail station. Its video capabilities let you view or capture video from a VCR, laser disc, or camcorder in a window. You can also connect directly to a TV to show your presentations or to a VCR to make videotapes.

Using PlainTalk speech technology from Apple, the Macintosh Quadra 840AV

can respond to your voice commands. And it generates CD-quality stereo sound, so all your audio applications sound great.

In short, the Macintosh Quadra 840AV can serve as your personal communications center. Whether you're in the office or on the go, you can use it to work more efficiently and effectively than ever.

Features

Power and speed

- 40-MHz 68040 microprocessor
- 66-MHz 3210 digital signal processor
- 32-bit data bus

Memory

- 8MB of RAM, expandable to 128MB
- 1MB of VRAM, expandable to 2MB
- 230MB, 500MB, and 1GB internal hard disks available
- 2MB ROM

RAM Notes:
1) The 8MB RAM configurations come with one 8MB SIMM in one of the four SIMM slots.
2) The 16MB RAM configurations come with two 8MB SIMMs in two of the four SIMM slots.)

Display

- Works with all Apple monitors as well as NTSC, PAL, VGA, and SuperVGA displays.
- With 1MB VRAM upgrade, supports 24-bit color on monitors up to 16inches, allowing for display of millions of vibrant colors, or 16-bitcolor on 21-inch monitors.

Expansion

- Twelve built-in ports for peripheral devices, including video (composite and S-Video formats) and audio
- 3 NuBus slots for expansion cards
- Optional internal CD-ROM drive

System software

- System 7 with multitasking, file sharing, QuickTime, Balloon Help, TrueType, and more

Networking

- Built-in AppleTalk networking
- File sharing without a dedicated server

• On-board Ethernet networking

Compatibility

• Macintosh, MS-DOS, OS/2, and ProDOS disks

What's in the box?

Each unit includes a power cord, keyboard cable, mouse, microphone, system software and CD Caddy#.

System software includes System 7.1, System Enabler 088, Color Macintosh Basics, QuickTime 1.6, and HyperCard Runtime.

System software shipped on a bootable CD-ROM, the "Install Me First CD" which can double as a rescue disk.

Documentation included with the Quadra 840AV

• Getting Started with your Macintosh Quadra 840AV
• Technical Information for the Macintosh Quadra 840AV
• Macintosh User's Guide for desktop Macintosh computers
• AppleCD 300i User's Guide#
• Apple Extras User's Guide
  (Located in the Apple Extras folder on the hard disk.)

#(Only for systems with built-in CD-ROM drive.)

Configurations and Ordering Information

Macintosh Quadra 840AV 8/230

Order No. M9025LL/A

• Macintosh Quadra 840AV personal computer with 8MB of RAM, 1MB of VRAM, built-in 1.4MB Apple SuperDrive, and internal 230MB hard disk drive
• Mouse
• Complete setup, learning, and reference documentation
• System software version 7.1
• Limited warranty

Other Macintosh Quadra 840AV configurations

• With 8MB of RAM, 230MB hard disk, internal CD: Order no. M9028LL/A
• With 16MB of RAM and 500MB hard disk: Order no. M1836LL/A
• With 16MB of RAM, 500MB hard disk, and internal CD: Order no. M1837LL/A
• With 16MB of RAM, 1GB hard disk, and internal CD: Order no. M1838LL/A

RAM Notes:
 1) The 8MB RAM configurations come with one 8MB SIMM in one of the four SIMM slots.
 2) The 16MB RAM configurations come with two 8MB SIMMs in two of

the four SIMM slots.)

Macintosh Quadra 840AV Logic Board Upgrade

Order No. M1848LL/A

- Upgrades a Macintosh Quadra 800 computer to a Macintosh Quadra 840AV computer

Macintosh VRAM Expansion Kit (2-256K SIMMs)

Order No. M5953LL/A

- Provides greater on-screen colors (24-bit display on most monitors). Requires two kits (all four sockets must be filled).

Article Change History:
27 August 1993 - added additional documentation information.
24 August 1993 - added RAM SIMM information for 8MB and 16 MB configurations.
13 August 1993 - added VRAM Expansion Kit information.
30 July 1993 - added correct name of System Enabler.

Macintosh AV Series: No 24 Bit Addressing Support (1/94)

Revised: 1/21/94
Security: Everyone

Macintosh AV Series: No 24 Bit Addressing Support (1/94)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 20 January 1994

TOPIC ----------

Can applications that are not 32 bit clean run on the Centris 660AV, the Quadra 660AV and the Quadra 840AV?

DISCUSSION ----------

No. The Centris 660AV, Quadra 660AV and Quadra 840AV's ROM will not permit the Memory Control Panel to be set to 24 bit memory addressing. Applications that are not 32 bit clean will not run. If you encounter software that is not 32 bit clean, you should contact the software developer for upgrade information.

Further, there is an error in the Macintosh User's Guide for Desktop Macintosh Computers (p/n 030-2651-B) regarding 32-bit addressing on page 159 which states:

> "If your Macintosh can use 32-bit addressing, you can turn the feature on or off in the Memory Control Panel (choose Control Panels from the Apple menu and open the Memory control panel)."

The AV Series require that 32-bit addressing be turned on. You cannot turn it to 24-bit addressing.

Article Change History:
20 January 1994 - Added correction to User's Guide regarding 32-bit addressing.
23 December 1993 - Revised to include all AV models.

Macintosh AV Series: Custom Integrated Circuits (12/93)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 14 December 1993

TOPIC ----------

The Macintosh AV Series of computers* use several new custom Integrated Circuits (ICs). Some of these ICs are grouped to form different subsystems that operate independently within the system. These ICs are:

DISCUSSION ----------

(* The Macintosh AV Series includes the following models:
Macintosh Centris 660AV, Quadra 660AV and Quadra 840AV.)

Digital Signal Processor (DSP)

A separate 32-bit floating point processor used to perform fast, complex real-time data processing tasks such as speech recognition, audio compression, and analog modem signal processing. The DSP contains its own 8KB of internal RAM to minimize its use of system memory.

Memory Controller and Arbiter (MCA)

Supports the bus interface between RAM and ROM memory and the main processor, DSP, MUNI, and PSC; controls access to eight banks of DRAM; controls access to ROM; performs arbitration for control of the CPU bus between the main processor, PSC, MUNI, and DSP; and furnishes the bus time-out signals for the main processor, I/O, MUNI, and DSP buses.

Peripheral Subsystem Controller (PSC)

Provides nine dedicated DMA channels, decodes the I/O memory mapping, handles all internal system interrupts, handles VIA interrupts, and contains the buffers used for sound data to and from the Singer sound encoder and decoder (CODEC).

Macintosh Universal NuBus Interface (MUNI)

Supports the full range of NuBus master/slave transactions with single or block moves, including dumps and runs in which the main processor is master and the NuBus is slave , supports faster data transfer rates to and from the CPU bus, and supports NuBus ‘90 data transfers between cards at a clock rate of 20 MHz. NOTE: the MUNI is located on the main logic board in the Quadra 840AV and on the optional NuBus adapter card for the Centris 660AV.

Cyclone Integrated Video Interfaces Controller (CIVIC)

Manages VRAM; controls data transfer between VRAM, the VDC and Sebastian; provides 32-bit or 64-bit data paths between VRAM and the main processor or a slot card; performs convolution; provides needed video timing signals; and generates the vertical blanking and video-in interrupt signals.

Sebastian

A video color palette and video digital-to-analog converter (DAC). It accepts up to 64 bits of digital input, either as one 64-bit port or as two 32-bit ports. Lets one 32-bit port handle digital video while the other processes graphics using the same or different color lookup tables. Supports mixing video with still graphics, uses a convolution filter to minimize flicker in line-interlaced displays, and supports displays with clock speeds up to 100 MHz.

Video Data Path Chip (VDC)

Performs input video window scaling with horizontal and vertical filtering, accepts YUV 4:2:2 color-encoded input from the Digital Multistandard Decoder or the DAV slot card bus, and produces 16-bit 1:5:5:5 RGB, 8-bit grayscale, or YUV 4:2:2 output.

Mickey

Accepts analog video signals from Sebastian, provides the encoding to NTSC or PAL digital formats, and produces S-video, composite, and RGB video outputs.

New Age

A floppy disk controller that controls the Apple SuperDrive at all of its recording densities, provides MFM and GCR recording formats, supports full asynchronous operation for DMA, and generates an interrupt on disk insertion. NOTE: in previous Macintosh models system software was required to poll floppy drives at frequent intervals to determine if a disk had been inserted, this is no longer necessary.

Curio

A multipurpose I/O chip that contains a media access controller for Ethernet, a SCSI controller, and the Serial Communications Controller (SCC).

Apple Telecom External Clock Synchronizer (ATECS)

Provides the control functions that synchronize the DSP and sound subsystems to an external clock signal received through the Apple GeoPort. In the absence of an external clock, it generates crystal- controlled timing signals.

Cuda

Manages system resets from various commands, turns system power on and off, maintains parameter RAM, manages the ADB, manages the real-time clock, and lets an external signal received through the Apple GeoPort control system power.

Singer

An I/O chip that constitutes a 16-bit digital sound CODEC, conforms to the IT&T ASCO 2300 Audio- Stereo CODEC Spec.

Endeavor

A programmable video clock chip.

Digital Multistandard Decoder

Decodes the color information in NTSC, PAL, and SECAM video formats using a clock synchronized to their line frequency.

Note: Many of these Integrated Circuits are described in more detail in other Tech Info Library articles.

Article Change History:
14 December 1993 - Retitled article and revised topic to reflect entire AV Series.

Newton: How to Beam Information To and From a Sharp OZ (7/93)

Revised: 7/29/93
Security: Everyone

Newton: How to Beam Information To and From a Sharp OZ (7/93)

==========

Article Created: 30 July 1993

TOPIC --------------------

This article describes how to beam information to and from a Sharp OZ/IQ 9000.

DISCUSSION --------------------

You can beam information to and from any series 9000 Sharp OZ/IQ.

To send a beam from a Newton to a Sharp QZ, send the beam as usual from yourNewton. Set the Sharp to receive any Direct IR transmission (detailed in the Sharp manual).

To send a from a Sharp to a Newton, send the beam as usual from the Sharp (see the Sharp manual for details). Receive the beam on your Newton according to the following instructions even if your Newton is set to receive beams automatically:

1) Tap Extras to open the Extras Drawer, then tap In Box.

2) Tap Receive, then tap Beam.

Newton MessagePad: How to Print (8/94)

Revised: 9/26/96
Security: Everyone

Newton MessagePad: How to Print (8/94)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 31 August 1994

TOPIC

This article describes how to print an item from your Newton MessagePad to a printer.

DISCUSSION

To print an item such as a note, name card, or Date Book appointment from your Newton, follow these steps:

1) Connect your printer to your Newton by plugging the printer cable into your Newton's communications port.

2) Go to the item that you would like to print.

3) Tap the Action button; then tap Print. Note that the name of the Print command depends upon what area you're in.

4) Tap Printer to select the printer type. You will see a dialog box that lists the available printers. Tap the name of the printer that you wish to print to, then tap Use Printer to select a printer.

5) Tap Format to see a list of formatting options. These options will change depending upon what item you're printing.

6) Tap Preview to see what the printed document will look like.

7) Tap Print to print the document to the Out Box. The Out Box will appear on your screen.

8) To send a single printed item from the Out Box, tap the item you want to send, then tap Print in the dialog box which appears. The item will now be sent.

9) To send all printed items in the Out Box, tap the Send button in the Out Box, then tap Print in the pop-up menu. All of the printed items will now be sent.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Article Change History:
31 Aug 1994 - Reviewed and added fax document information.

Newton MessagePad: How to Send and Receive Beams (5/95)

Revised: 5/9/95
Security: Everyone

Newton MessagePad: How to Send and Receive Beams (5/95)

==========

Article Created: 3 August 1993
Article Reviewed/Updated: 9 May 1995

TOPIC ----------

This article describes how to send and receive beams from another Newton MessagePad.

DISCUSSION ----------

You can transmit information between two Newton MessagePads by using an infrared beam.

You can send information from one Newton to another by using an infrared beam. You must point the beam window on the front of each Newton directly at the other from a range of less than three feet.

Sending a Beam

To beam information to another Newton, follow these steps:

1) Go to the information you wish to beam. This can be any item with an Action button (or envelope icon) - a note from the Notepad, a card from the Name File, an appointment from the Date Book, etc.

2) Tap the Action button, then tap Beam. A dialog box appears which tells you to make sure the other Newton is ready to receive information. When you have aligned the beam windows of both Newtons, tap Beam.

3) Your beam will now be sent. The Out Box will open automatically so you can watch the progress of your beam.

The Newton will try to beam your information for about two minutes. If it cannot send the information, you will see a "timed out" message in the Out Box. If your Newton fails to send a beam:

- Move the Newtons closer together and make sure they're pointed directly at each other.

- Make sure the other Newton is ready to receive a beam.

Receiving a Beam

You can either receive beams individually or set your Newton to automatically receive all beams.

To Receive an individual beam:

1) Tap Extras to open the Extras Drawer, then tap In Box.

2) Tap Receive, then tap Beam. A dialog box appears which asks you to confirm that you want to received beamed information. Tap Receive.

3) Your Newton is now ready to receive a beam. The In Box will open automatically so you can watch the progress of your beam.

4) The new item will appear in the In Box. When you tap the item, a dialog box appears which gives you the option to tap Put Away to put the item away, Delete to delete it, or X to leave it in the In Box. These options will return you to the In Box. Tap X to leave the In Box.

Automatically receiving new beams:

1) Tap Extras to open the Extras Drawer, then tap Prefs.

2) Tap Beam to choose your preferences. Your options are:

   - Confirm before receiving
     This allows you to choose whether to receive beams without being asked.

   - Store beams immediately
     This allows you to choose whether to automatically put beamed information in the appropriate areas.

   - Receive beams automatically
     This will allow your Newton look for incoming beams automatically.

     Note: If your Newton isn't plugged into AC power, this will decrease its battery life.

   - Open In Box while receiving
     If you have checked "Receive beams automatically", this option allows you to choose whether or not to open the In Box while you're receiving a beam.

   - Close In Box after receiving
     This option allows you to choose whether or not to automatically close your Newton's In Box after receiving a beam.

To receive beams automatically, be sure to uncheck "Confirm before receiving" and check "Receive beams automatically". Choose the other options as desired.

Your Newton will now be able to automatically receive beams.

Article Change History:
09 May 1995 - Removed FAX information.
30 Sep 1994 - Updated formatting.
31 Aug 1994 - Reviewed and combined send and receive beam articles.

Newton: How To Transfer Information To/From a Sharp OZ (3/96)

Revised: 3/15/96
Security: Everyone

Newton: How To Transfer Information To/From a Sharp OZ (3/96)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 15 March 1996

TOPIC -----

This article describes how to transfer information to and from an Apple MessagePad and a Sharp OZ/IQ. You cannot use transfer information from a MessagePad device that uses the Newton 2.0 OS. You can only use the Newton 1.x OS for transferring information between these two devices.

DISCUSSION -----

You can transfer information to an Apple MessagePad from any Series 7000, 8000, or 9000 Sharp OZ/IQ with a serial cable. This process is suited for transferring large amount of information or an entire application.

You can also transfer information between an Apple MessagePad and a Series 9000 Sharp OZ/IQ by infrared beam. Beaming, however, is better suited for transferring small amounts of information, such as a single card or appointment.

To transfer information by cable, follow these steps:

Step 1

Connect the Sharp OZ/IQ to your Newton with a RS-422 Level Converter (Sharp part number CE135T).

Step 2

Put the Sharp OZ/IQ into PC LInk Mode. This procedure is discussed in the Sharp manual.

Step 3

On your Apple MessagePad, tap the Extras button, then tap the Sharp button to

open the Sharp dialog box.

Step 4

In the Sharp dialog box, tap the diamond next to Applications. This displays a list of the different Sharp applications available for transfer. Tap the application you wish to transfer.

Step 5

If the Sharp device has a storage card, choose whether you want to copy from the card or from the internal memory. If your Apple MessagePad has a storage card, choose whether you want to copy to the card or to the internal memory. The default for both systems is internal memory.

Step 6

Tap Receive. The Sharp device displays a "Sending" message. When it says "PC Link" again, the copy is finished.

Step 7

Import other applications as desired. To avoid duplication, import each Sharp application only once. Also, not all Sharp OZ/IQ models have every application.

When you are finished, Tap X.

If your Apple MessagePad tells you it could not import the information, it may not have enough memory. Make more memory available and try again.

Article Change History:
15 Mar 1996 - Added Newton 2.0 OS compatibility information.

Newton: How to Print the Names File (7/93)

Revised: 7/29/93
Security: Everyone

Newton: How to Print the Names File (7/93)

==========

Article Created: 30 July 1993

TOPIC --------------------

I keep my address book on my Newton. How can I print out a copy without printing out each name card individually?

DISCUSSION----------

To print out all or part of your Names file, simply open any file in the Names application. Then:

1) Tap the Action button in the lower-right corner, then tap Print Card. A window, or routing slip in this case, will pop up.

2) Tap Printer and select the printer you'll be using.

3) Tap Format and choose which grouping of files you wish to print.

- Single Card prints only the card you have open or selected.
- Cards prints each card in the Names file as it appears on the Newton.
- Cards and Notes prints each card in the Names file as it appears on the Newton, plus any notes associated with the cards.
- Phone list prints only the names and phone numbers of the people in your Names file.
- Summary prints all the information you entered regarding the people in your Names file, except for the notes.

4) Tap Preview to be certain the information you want will be printed in the correct format.

5) Tap Print.

6) If your Newton is connected to a printer, the Out Box will open. Tap the name of the Names file, then tap Print. Your file will be printed.

7) If you are not connected to a printer, the information will be stored in your Out Box. Connect a printer to your Newton, tap the Extras button, then tap Out Box. Tap the name of the Names file, and tap Print. Your file will be printed.

Newton: System Updates (9/93)

Revised: 9/9/93
Security: Everyone

Newton: System Updates (9/93)

==========

Article Created: 30 July 1993
Article Revised/Updated: 9 September 1993

TOPIC -----

This article discusses system updates for your Newton.

DISCUSSION -----

Newton will support RAM-based system updates. These updates can be system enhancements or bug fixes. System updates can be factory-installed or downloaded and installed by end-users. Most updates use between 8 and 16K of RAM.

To determine if a update is loaded, check the ROM version in the Startup screen or the Preferences screen. The last digit following the ROM version denote the number of the system update that is installed. For example, 1.02 would mean ROM version 1.0 with update 2. If the last digit is 0, no updates are installed.

RAM-based updates are kept alive by the lithium backup battery. In the special emergency shutdown state, the update can be kept intact for about 26 years. To achieve this state, run your Newton with the backup battery in, no primary battery installed and the Power Adapter plugged in. When you remove the Power Adapter with the unit on, Newton will shutdown virtually everything including the system clock. RAM and RAM-based system updates are maintained, however.

If you restore data to your Newton from a backup, the system update will remain intact.

You can erase the system updates by removing all batteries and all power from your Newton for over 10 minutes

Article Change History

9 September 1993 - corrected the method for erasing system updates and revised the example version numbers for the system update.

Newton: Conflicting Appointments (7/93)

Revised: 7/29/93
Security: Everyone

Newton: Conflicting Appointments (7/93)

==========

Article Created: 30 July 1993

TOPIC--------------------

How do I schedule two or more appointments that have overlapping times?

DISCUSSION--------------------

You can set overlapping appointments by placing them side-by-side on the Calendar:

1) Create the first appointment as usual.

2) Draw a vertical line on the right side of the page to mark the time for the second appointment.

3) Tap the marker you just created to open the appointment slip, and fill it out as you like.

Scheduling conflicts can inadvertently occur when you use the Assist function to put appointments into the Calendar. If you schedule two things for the same time and the same date using Assist, they will appear next to each other at the scheduled time.

When Newton Assistant is used, it will show you the scheduled meeting on that day's Calendar page. Be certain to check the Calendar after using Assist to make sure no meetings conflict. Newton will assume you intended to double-book, and will not warn you of a conflict.

Newton: Conserving Power (9/94)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 28 September 1994

TOPIC ----------

How can I conserve power and and extend battery life on my Newton?

DISCUSSION ----------

Your Newton automatically conserves power by turning off various circuits when they're not in use. To extend battery life, follow these steps:

1) Use the AC power adapter whenever you can.

2) Turn your Newton off when you're not using it.

3) Set a shorter period of time before your Newton goes to sleep.

4) Avoid beaming items and using the communications port when Newton is not plugged into the AC adapter.

5) Avoid setting your Newton to receive beams automatically.

6) Avoid switching on both text recognizers at the same time.

Revised: 6/5/96
Security: Everyone

Newton: How to Backup and Restore (10/94)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 12 October 1994

TOPIC -----

This article describes how to make a backup of your Newton, as well as how to restore backup data.

DISCUSSION -----

There are two ways to backup the data on your Newton:

- Using the Newton Connection Kit
- Using a PCMCIA Type II storage card

Using the Newton Connection Kit
==========

It is easy to use the Newton Connection Kit to backup up your data to a Macintosh. When you synchronize your Newton MessagePad with the Newton Connection Kit, it performs a backup of the data on your Newton to the Macintosh system to which you connect. Follow the procedure described in your Connection Kit documentation to connect and synchronize the Connection Kit. Once you have done this, you will find three files displayed on your Macintosh:

- Newton
- Newton Archive
- Newton Backup

These three files contain information stored on your Newton MessagePad.

Newton

The file named Newton contains the current backup of all of your Newton's data. You can also use this file, along with the Connection Kit, to add data to your Newton. To do this, enter into this file and synchronize your Newton with the

Connection Kit. Your Newton is updated with this new data. Remember that the new data from the Connection Kit replaces all existing data on your MessagePad.

Newton Backup

This file is a copy of the previous synchronization file. When you synchronize, the current synchronization file (the file named Newton) is renamed to Newton Backup, which completely overwrites the old Newton Backup file. Then, a new synchronization file (or Newton file) is created. If you want to keep a copy of the Newton Backup file, you must duplicate it before synchronizing.

Newton Archive

This file contains all information deleted from your Newton since the last time you synchronized. You can use this archive file to recover data that you've inadvertently deleted from your Newton.

During synchronization, the Connection Kit looks at the Newton Backup file to determine which data you've deleted from your Newton since your last synchronization. This data is then copied from the Newton Backup file to the Newton Archive file.

Using a PCMCIA Type II Storage Card

You can keep a backup copy of your Newton's data on a PCMCIA Type II storage card, then restore your data to your Newton from that card.

Making a Backup

These steps describe how to backup to a storage card:

1) Insert a storage card into your Newton. Note that each storage card can only store one backup copy. Existing backup copies are erased to make room for the new one.

2) Tap Extras, then tap Card. When the dialog box appears, tap Backup. When your Newton is finished backp up data, the message box disappears.

Restoring a Backup

These steps describe how to restore information from a storage card:

1) Insert the storage card with your backup copy into your Newton.

2) Tap Extras, then tap Card. You see a dialog box that shows the contents of the storage card.

3) Tap Restore. You see a dialog box that reminds you that you are replacing all of the information in your Newton. This procedure overwrites all data currently in your Newton. Tap OK if you want to continue or Cancel to stop.

Regardless of the method you select, remember to make regular backups!

Newton: How to Dial a Phone Number (7/93)

Revised: 7/29/93
Security: Everyone

Newton: How to Dial a Phone Number (7/93)

==========

Article Created: 30 July 1993

TOPIC ----------

This article discusses how to dial a phone number from your Newton.

DISCUSSION ----------

Newton can look up phone numbers in the Name File and dial them for you. You can use Newton's external speaker to dial a number or use an optional modem to connect to a telephone.

You can tell Newton to place a call in two ways:

- Open the Names file (by tapping on the Names button) and tap the phone number of the person you want to call.
- Open the Intelligent Assistant (by tapping on Assist) and asking it to call someone. For example, if you wanted to call your mother and she was listed in the Names File as Mom, you would write call Mom in the space.

After you tell Newton to place a call, a dialog box displays the name of the person you are dialing and the phone number you have selected. Follow these steps:

1. If necessary, correct the name and phone number displayed. To choose a different phone number for this card, tap the diamond next to the phone number. This will display all of the phone numbers available for this card.
2. Choose the dialing destination. Tap Speaker to have Newton dial the phone number through its speaker or tap Modem to dial through the modem.
3. Tap the Options button to display the Options dialog box. You can enter the following options:

- Area Code - Enter the area code of the phone that you are using. If the phone number you're calling has a different area code, Newton will dial the number 1, followed by the area code.

- Prefix - Enter any sequence of numbers that must be dialed before the phone number. For example, many office phone require you to dial 9 for an outside line. For a pause in dialing, you can add commas between phone number digits. Each comma gives a two-second pause and you can use as many as you like.

- Access Code - Enter the access code for your preferred long-distance company. If you fill in a number here, Newton will use this number instead of "1" when dialing a long-distance number.

- Credit Card - Enter the calling card number to which you want to bill the call. Newton will pause a few seconds before dialing the credit card number.

Tap X when you have finished entering options.

4. If you're dialing through the speaker, tap Call and hold the mouthpiece of your telephone next to Newton's speaker (near the Apple logo).

   If you're dialing through the modem, make sure the modem and telephone are connected to the same phone line, then tap Call. After the modem has finished dialing, pick up the telephone handset.

Newton: How to Find an Item (7/93)

Revised: 7/29/93
Security: Everyone

Newton: How to Find an Item (7/93)

==========

Article Created: 30 July 1993

TOPIC -----

This article discusses how to find an item on your Newton.

DISCUSSION -----

You can search for information in all areas of your Newton's data or you can choose to search only the area (Notepad, Date Book, Name File) that you're looking at.

You can search for whole words, partial words, more than one word at a time or dates. If you search for more than one word at a time, your Newton will take you to the first item that has both words whether or not they're next to each other.

Searching all areas

Here's how to find an item by searching all areas at once:

1) Tap the Find button. Write the text you wish to search for into the opened dialog box.

2) Tap All. The Newton will show a list of all places where the word is found. You can go to a particular item in the list by tapping the item. If your Newton finds more information than fits on the screen, tap the down arrow to see more.

   If you don't see the item you're looking for, tap X.

Searching one area

Here's how to find an item by searching only one area at a time:

1) Go to the area you want to search, then tap the Find button. Write the

text you wish to search for into the opened dialog box.

2) Tap Find. Your Newton goes to the first place it finds the word. Tap the down arrow to see the other place or places where Newton found the word.

3) When you've finished searching, tap X.

Searching by date

Here's how to find information created before or after particular date:

1) Tap the Find button, then tap Look For.

2) Tap either "dates before" or "dates after." as desired.

3) Write a date into the blank that appears.

If you are searching all areas, tap All. The Newton will show a list of all places where the word is found. You can go to a particular item in the list by tapping the item. If your Newton finds more information than fits on the screen, tap the down arrow to see more. If you don't see the item you're looking for, tap X.

If you are searching only one area, tap Find. Your Newton goes to the first place it finds the word. Tap the down arrow to see the other place or places where Newton found the word. When you've finished searching, tap X.

Newton: Built-in Formulas (7/93)

==========

Article Created: 30 July 1993

TOPIC ----------

This article discusses how to use the formulas that are loaded into your Newton.

DISCUSSION ----------

Newton has several built-in formulas for your convenience. They are Metric/U.S. Conversion, Currency Exchange, Loan Payment, and Net Present Value. To use these formulas, tap the Extras button, then tap the Formulas icon.

You can enter data by hand or by using an on-screen keypad. To display the keypad, tap twice on the blank that you wish to fill in. Tap the numbers and symbols that you want, then tap X to close the keypad. To move the keypad, holding the pen on the keypad's border and drag it to the desired location.

Here is a description of the formulas:

- Metric/U.S. Conversion - This formula converts from Metric to U.S. or U.S. to Metric measurements. Enter the measurement you know on one side of the chart and the converted value will appear on the other side.

- Currency Exchange - This formula converts from one currency to another, given a particular exchange rate. Tap the button next to the number you want Newton to calculate and fill in the numbers that you know. Newton will calculate the desired value.

- Loan Payment - This formula gives information on loans paid back monthly with a constant interest rate. Tap the button next to the number you want Newton to calculate and fill in the numbers that you know. Newton will calculate the desired value.

- Net Present Value - This formula answers questions about periodic interest

and payments. Tap the button next to the number you want Newton to calculate and fill in the numbers that you know. Newton will calculate the desired value.

Be sure to scrub out any old numbers to erase them. Also note that you must write interest amounts without the percent sign and you must use the same period amount for all blanks.

Apple MessagePad: How to Power On (7/96)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 01 July 1996

TOPIC ----------

This article describes how to power on your Apple MessagePad.

DISCUSSION ----------

Here is how to power on your Apple MessagePad for the first time:

1) Insert a fresh set of batteries in your Apple MessagePad.

2) Remove the battery cover and press the reset switch with the tip of your stylus. This resets your Apple MessagePad.

3) Slide the power switch down and let it spring back. The power switch is located on the left side of the Apple MessagePad.

4) Take the Newton's pen and tap the Xs that are displayed on the screen. This will align your Apple MessagePad's screen.

After you have powered on your Apple MessagePad for the first time, you can power it on on and off by sliding the power switch down and letting it spring back.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Newton: How to Send a Fax (9/94)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 28 September 1994

TOPIC ----------

How do I send a fax document from my Newton?

DISCUSSION ----------

To fax an item from your Newton, such as a note, name card or Date Book appointment, follow these steps:

1) Connect your fax modem to your Newton. Most fax modems connect by plugging a cable into the Newton's communication port.

2) Set your fax preferences by tapping the Modem selection, then tap X to return the Extras drawer. You will be able to choose the following options:

   - Modem volume
   - How long the modem will wait for an answer
   - Pulse or tone dialing
   - Whether the modem will wait for a dial tone

3) Go to the item you would like to send.

4) Tap the Action button, then tap Fax. You will see a dialog box which allows you to:

   - Enter the name and phone number of the addressee
   - Select the fax format - plain, letter, memo, or date summary
   - Select manual dialing
   - Select other dialing options - area code, prefix, access code, and credit card number

5) If you want to see what your fax will look like before printing, tap

Preview.

6) Tap Fax. The Out Box will automatically appear.

7) Tap Send, then tap Fax. Your fax will be sent.

Newton: How to Set and Change a Password (5/96)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 31 May 1996

TOPIC -----

This article discusses how to set and change a password on your Apple MessagePad.

DISCUSSION -----

You can protect the data on your Apple MessagePad by setting a password. When you set a password, you have the option of requiring the password each time your Apple MessagePad is powered on, or at certain intervals.

If you set a password and forget it, you will not be able to use your Newton again until you perform a hard reset.

Setting a Password with Newton 1.x OS
==========

Step 1

Tap the Extras button at the bottom of the screen

Step 2

Tap Prefs

Step 3

Tap Personal in the Preferences Menu

Step 4

Tap Set Password.

Step 5

Write your password in the dialog box that appears.

If you use non-alphabetic characters, you will have to use the on-screen keyboard.

Step 6

Tap Set to set your password or tap X to cancel.

Note:
You will be asked to enter your password every time you turn on your Apple MessagePad.

Setting a Password with Newton 2.x OS
=====================================

Step 1

Tap the Extras button at the bottom of the screen.

Step 2

Tap Prefs

Step 3

Tap Security

Step 4

Tap Set PIN

Step 5

Tap the numbers on the keypad you want your PIN to be

Step 6

Tap the ENT

A new keypad appears requesting you enter your PIN again.

Step 7

Tap your PIN numbers on the keypad

Step 8

Tap the ENT

New buttons appear in the Security slip

Step 9

Tap the Ask for PIN button

A list appears with several choices

Step 10

From the list, tap you choice when you want the PIN request to appear.

Changing a Password with Newton 1.x OS

It is a good idea to change your password periodically.

Here is how to change your password:

Step 1

Tap the Extras button

Step 2

Tap Prefs

Step 3

Tap Personal

Step 4

Tap Set Password

You will see a dialog box which has blanks for your old and new password. Write your old password in the blank. To change your password, enter a new password in its blank. To eliminate your password, leave the new password blank empty.

Step 5

Tap Set to set your password, or tap X to cancel.

Changing a Password with Newton 2.x OS

Step 1

Tap the Extras button at the bottom of the screen.

Step 2

Tap Prefs

Security: Everyone

Newton: How to Use the Date Book - Overview (10/94)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 26 October 1994

TOPIC ----------

This article describes how to use the Newton's Date Book.

DISCUSSION ----------

The Date Book allows you to organize appointments and keep a To Do list in the form of a calendar. When you create an appointment on a calendar page, the bar at the left edge of the appointment is called the activity marker.

To enter the Date Book, tap the Dates button.

Date views

There are several ways of looking at a calendar page.

- To see a date in the previous or next month, tap the arrows next to the month.
- To see a particular day, tap that date.
- To see a two-week agenda of appointments, tap the dot between the two arrows.
- To see appointments for several days at a time, select dates horizontally or vertically.
- To see an appointments for a month at a time, tap the name of the desired month. Note that dark bands will represent appointments.
- To see the calendar eight months at a time, tap the year.

You can always return to today's date by tapping the Today button.

Making an appointment

1) Go the date you want. You will see a standard date card. If you don't see the hours you want, tap the arrows at the bottom of the screen.

2) Write the name of the appointment next to its starting time. You may denote the length of the meeting by drawing a line from the starting time to the ending time.

Adding notes to an appointment

1) Tap the activity marker. You will see a notes box with the name of your appointment, and its starting and ending time.

2) Write or draw notes inside the box, then tap X when you're finished.

Using the Datebook's Alarm

You can use the alarm in the Datebook for meetings as well as events or occasions, like birthdays or anniversaries.

1) Tap the activity marker next to the desired appointment, then tap Alarm.

2) Mark the Alarm On box to turn on the alarm.

3) If you want the alarm to go off ahead of time, write the amount of notice you want in the notice blank, then tap the notice box and choose whether you want the alarm to go off minutes, hours, or days in advance.

4) Tap X.

When the alarm goes off, a message appears on your screen. You will also hear a sound if you have turned on the Sound Alarm Effects selection in the Sound Preferences.

Setting repeating events

1) Tap the activity marker, the tap Frequency.

2) Tap one of the choices of the following list:

   - Don't repeat
   - Every week
   - Every other week
   - Every month
   - Every year
   - Week in month

   The box below the list summarizes your choices.

3) Correct the starting and ending times of the appointments, if necessary.

4) If the meetings only repeat for a limited time, write the date of the last meeting in the No Meetings After blank.

5) Tap X.

Some examples:

- If your meeting occurs on the third Friday of each month, tap the radio button marked "Week in Month," tap the box next to "third."

- If your meeting occurs every Monday and Friday, tap the radio button next to "Every week," and tap the boxes marked "M" and "F."

- If your meeting occurs every day, tap "Every week," and select all the boxes corresponding to days of the week.

Changing an appointment time

To change the starting time, hold the pen on the activity marker until it turns white, then move it to the correct time.

To change the length of the appointment, drag the bottom end of the line to the correct length.

To move an appointment to a different date, you can use multiple-day view mode or normal view mode.

- In multiple-day view mode, select the dates you want to move from and to, then use the pen to drag the activity marker from one date to the other.

- In normal view mode, hold the pen in the middle of the bar and move it to the top of the screen. It will be reduced to a single word at the top of the screen. Then go to the desired date and drag the word from the top of the screen to the desired time on the calendar.

Deleting appointments

To erase an appointment, scrub out the activity marker next to it or tap the activity marker and tap Delete on the appointment slip that appears.

To automatically erase appointments after a certain number of days, tap the Action button, then tap Delete. You'll see a dialog box which is titled "Delete meetings older than _____ days." Scrub out the number in the blank and write the number you want, then tap Delete.

Sending calendar information

You can send calendar information to a printer, Fax, electronic mail service or

another Newton for two, five, seven, or fourteen days at a time.

Go to the beginning date you want to send and tap the Action button. Then choose between Print, Fax, Beam, and Mail options.

Newton: How to Use the Names File (10/94)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 25 October 1994

TOPIC ----------

This article describes how to use the Newton's Names File.

DISCUSSION ----------

The Names File allows you to organize address information in the form of a card file.

To enter the Name's File, tap the Names button.

Card views

There are three ways of looking at a card: Card, Card & Notes, and All Info. You can choose one of these by tapping the Show button at the bottom of the screen in the Names File.

The Card view shows the name, address, and phone number, while the Card & Notes view displays the Card view with an area for you to write notes. The All Info view shows all the information on the card. You must use the All Info view if you want to change or add information.

To change views, tap Show, then tap the view you want. You can go directly to the All Info view by tapping twice on any card.

Making a new name card
---
1) To begin a new card, tap New. A new address card will appear which shows the All Info view.

2) Tap each blank that you want to fill in and write in the box that opens. If there is a diamond in the blank you're filling in, tap it to see choices, then select the appropriate choice.

3) To alphabetize the card, tap Sort By, then tap your choice.

4) To choose how the card should look, tap Card Style, then tap your choice.

5) Return to the card view by tapping Show, then tapping Card.

If you want to use a keyboard to enter information in any card, tap twice in any box.

Editing a name card

1) Tap Show, then tap All Info to display the All Info view.

2) Tap the entry that you want to change. When the box appears, delete and insert text as you wish.

3) Return to the card view by tapping Show, then tapping Card.

Adding notes to a name card

1) Tap Show, then tap Card & Notes to display the Card & Notes view.

2) Write or draw in the note area that appears.

3) Return to the card view by tapping Show, then tapping Card.

Selecting name cards

To scroll through the cards in your Newton, tap the arrows at the bottom of the screen.

To see an alphabetical list of your cards, tap the dot between the arrows. If the list of cards is larger than the screen, you can scroll through the list by tapping the arrows. To go to a particular part of your card list, tap the corresponding letter of the alphabet which is displayed at the bottom of the screen.

To select a particular card, tap its title.

Tap X to close the list of cards.

Sending name cards

You can send notes to a printer, fax, electronic mail service or another Newton in a number of formats, including letter memo and plain text. The Action button controls sending notes.

If you wish to print the entire name card file, tap the Action button (with the envelope icon), then tap Print. When the print dialog appears, tap Format, tap Cards, Cards and notes, Phone list, or Summary, then tap Print. What you choose determines how much information will be printed and the format in which it will

be presented.

If you wish to print a single card, tap the Action button or envelope icon, then tap Print. When the print dialog appears, tap Format, tap Single Card, then tap Print.

Newton: How To Use The Notepad - Overview (10/94)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 25 October 1994

TOPIC ----------

This article describes how to use the Newton's Notepad.

DISCUSSION ----------

One of the central features of the Newton is its Notepad. You can create and organize notes, then send them to a variety of destinations. The Notepad is always open although it may be hidden underneath other items.

The Notepad is always open although it may be hidden underneath other times. To close other items on your Newton and view the Notepad, tap X.

Making a new note

To begin a new note, draw a line across the screen. If the line becomes a separator bar, you have created a new note. If this line becomes a plain line, tap Undo and try again.

Adding information to a note

If you need more room, drag down the following note's separator bar with your stylus until you have enough room. If you are writing the last note in the Notepad, tap the down arrow below the screen to add more room.

Using the separator bar

The separator bar at the top of each note give you information about the note. The bar displays an information icon, the day and date, the folder and envelope icons, and displays the folder the note is stored in (if you're viewing all folders).

When you tap the information icon, you'll see the date and time the note was

created and the amount of memory the note takes up.

Selecting notes

To scroll through the notes in your Newton, tap the arrows below the bottom of the screen.

To see a list your notes, tap the dot between the arrows. If the list of notes is larger than the screen, you can scroll through the list by tapping the arrows. To select a particular note, tap its title. Tap X to close the list of notes.

Sending notes

You can send notes to a printer, fax, electronic mail service or another Newton in a number of formats, including letter memo and plain text. The Action button controls sending notes.

TOPIC ----------

This article describes how to use the Newton's To Do List.

DISCUSSION ----------

Each calendar page of the Date Book has a space for a to-do list. To view the to-do list for a particular date, go to the calendar date that you want and tap the Show To Do List button.

The clear box at the extreme left of each item is the check box, which you can check when you have finished that task.

The black box at the left of each item on the list is the priority marker, which shows the item's importance.

The vertical line between the priority marker and each item is the activity marker. You can use this marker to move, erase, or add space for the item.

To Do List views

The To Do List can be viewed in the same ways as the Date Book. Here are the ways to view the To Do List:

- To see a date in the previous or next month, tap the arrows next to the month.

- To see a particular day's To Do items, tap that date.

- To see an list of scheduled To Do items, tap the dot between the two arrows.

- To see To Do items for several days at a time, select dates horizontally

or vertically.

• You can always return to today's date by tapping the Today button.

Adding items to the list
---
1) From the To Do List, draw a line across the screen to create a new item.

2) Write the new to-do item.

3) Tap the black box to set the priority of the to-do item. The highest priority is 1.

Adding text to an item

Pull down the bottom end of the activity marker to give you more writing space.

Checking off an item

To check off an item, tap the blank check box to mark it to indicate it has been completed.

Deleting items

To erase a To Do List item, scrub out the activity marker next to it.

To automatically erase To Do List items after a certain number of days, tap the Action button, then tap Delete. You'll see a dialog box which is titled "Delete meetings older than _____ days." Scrub out the number in the blank and write the number you want, then tap Delete.

Sending To Do information

You can send To Do list information to a printer, Fax, electronic mail service or another Newton for two, five, seven, or fourteen days at a time.

Go to the beginning date you want to send and tap the Action button. Then choose between Print, Fax, Beam, and Mail options.

Newton: How to Insert Storage/Application Cards (10/94)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 24 October 1994

TOPIC ----------

This article describes how to insert storage or application cards into your Newton.

DISCUSSION ----------

Your Newton has a card slot which can accommodate a PCMCIA type II-standard card. This card can be either a storage card, which provides extra memory and user space or an application card, which provides software programs and more features.

Here's how to insert a storage or application card into your Newton:

1) Turn off your Newton.

2) Lift up the latch on the front left side of the Newton. Slide and release the lever underneath this latch.

3) Remove the currently installed card from the slot on the front of the Newton. If you have never put a card into your Newton, you will find a dummy plastic card which occupies the card slot. Keep this card and put it back in the card slot when you do not have a real card.

4) Insert your storage/application card with the arrow on top pointing toward your Newton. Push the card all the way in until you hear a click.

5) Push the latch back down. The storage/application card is now installed in your Newton.

NOTE: You should never use or store your Newton with an empty card slot. After you eject a card, be sure to insert a storage/application card or the protective

plastic card that came with your Newton.

Newton: How to Insert/Replace Batteries (8/94)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 31 August 1994

TOPIC -----

This article describes how to insert and/or replace the batteries into your Newton.

DISCUSSION -----

There are two different batteries in the Newton, the main battery pack and the backup battery. The main battery pack consists of either a battery holder which contains 4 disposable AAA batteries or a rechargeable nickel-cadmium battery pack. The backup battery is a round disposable 3-volt Duracell DL2032 lithium battery.

Warning: If both the main battery pack and the backup battery are exhausted, you will lose the entire contents of your Newton's memory, including any memory-based system updates that have been loaded into your Newton.

Replacing the Main Battery Pack
---

1) Place your Newton screen-side down on a surface that won't damage the screen.

2) Remove the rear battery cover. You will see a large rectangular opening for the main battery pack, a small round opening for the backup battery, an orange switch and a reset switch.

3) Slide the orange switch to the Replace Main position.

4) Insert a small coin in the slot on the left side of the main battery pack, then use the coin to lift the battery pack out of the battery compartment.

5) If you are using a disposable battery pack, open the door on the battery pack, remove any discharged AAA batteries, and insert fresh batteries. Be sure to orient the batteries as shown on the battery holder.

6) Slide the fresh battery pack into the Newton from left to right and and press the battery pack down into place. Be sure not to damage the spring-style power terminals inside the battery compartment.

7) Move the orange switch to the In Use position.

Note: If you are installing batteries in your Newton for the first time ONLY, press the reset switch with the plastic stylus that is included with your Newton.

8) Replace the rear battery cover. You may now use your Newton.

Replacing the Backup Battery
---

1) Place your Newton screen-side down on a surface that won't damage the screen.

2) Remove the rear battery cover. You will see a large rectangular opening for the main battery pack, a small round opening for the backup battery, an orange switch and a reset switch.

3) Slide the orange switch to the Replace Backup position.

4) If a backup battery is already in place, remove it.

5) Pick up the fresh backup battery by its edges and insert it into its opening. Wipe off any fingerprints with a soft cloth.

Warning: BE SURE to insert backup battery with the positive (+) side up. If the battery is inserted incorrectly, it may explode.

6) Move the orange switch to the In Use position and replace the rear battery cover. You may now use your Newton.

Newton: Preferences (10/94)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 24 October 1994

TOPIC ----------

This article describes your Newton's preferences.

DISCUSSION ----------

You can select a number of your Newton's preferences to tailor your Newton to the way you work.

To open your Newton's Preferences window, tap the Extras button, then tap Prefs. You can select any preference by tapping it in the Preferences window.

The Newton's user-selectable preferences are:

- Personal
  This option allows you to enter your personal information, such as name, company, address, country, fax and home phone.

- Date and Time
  This option allows you to set the current date and time.

- Locate
  This option allows you to choose what country's standards to use, such as country, keyboard and paper size. Do not change the country setting while filling out a form. Be sure to close the form first.

- Sound
  This option allows you to control the types and volume of sound the Newton plays.

- Sleep
  This option allows you to set how long you want your Newton to wait for activity before turning itself off.

- Memory
  This option allows you to control where new items are stored, to see how much memory is available, and to remove software.

- Pen Alignment
  This option allows you to realign Newton's pen.

- Recognizers
  This option allows you to remove word from your vocabulary list and control how the text and shape interpreters work.

- Handwriting Style
  This option allows you to tell Newton about your writing style to improve handwriting recognition.

- Letter Styles
  This option allows you to tell Newton about the way you write specific characters to improve handwriting recognition.

- Handwriting Practice
  This option allows you to see how well Newton can interpret your handwriting.

- Beam
  This option allows you to specify how your Newton receives information by infrared beam.

- Modem
  This option allows you to set options for your modem.

- Mail
  This option allows you to set options for electronic mail.

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). Security: Everyone

Newton: Sleep Mode (7/93)

==========

Article Created: 30 July 1993

TOPIC -----

This article discusses how to put your Newton into sleep mode.

DISCUSSION -----

To conserve power, you can set your Newton to turn itself off after a specified period of time. This state is called "sleep mode", in which your Newton shuts itself off and preserves your data.

To set the amount of time before your Newton goes to sleep, follow these steps:

1) Tap the Extras button, then tap Prefs.

2) Tap Sleep. When the dialog box opens, tap the diamond to the left of Sleep. You will see a list of choices for the amount of time delay before Newton goes to sleep. Tap your choice.

3) Tap X to close Prefs, the tap X again to close Extras.

Newton: Deleting Several Items At Once (7/93)

Revised: 7/29/93
Security: Everyone

Newton: Deleting Several Items At Once (7/93)

==========

Article Created: 30 July 1993

TOPIC----------

How do I delete several items on my screen at one time, without deleting the entire page?

DISCUSSION----------

There are two ways to delete more than one item at a time, whether it's a group of words, a group of graphics or a combination of both:

You can:

- Scrub out items that are near one another by using scrub marks that are long enough and tall enough to cover portions of each item you want deleted.

- Select the group of items to be deleted by first moving them together, then drawing a selection box around them. After they are selected, scrub one edge of the box, beginning your stroke outside the selected area. Everything in the selection box will be deleted.

Newton: A.M. Appointments Scheduled for P.M. (7/93)

==========

Article Created: 30 July 1993

TOPIC----------

I have scheduled several appointments incorrectly, because Newton thinks I'm talking about 10 P.M. rather than 10 A.M. How do I make sure I'm putting the entry next to the correct hour?

DISCUSSION----------

Be sure to check whether the hours on your Calendar are written in plain or bold text. Newton's Calendar writes the A.M. hours are in plain text and the P.M. hours are in bold text. Each day on Newton's Calendar begins at 12 A.M. (midnight) -- written in plain text -- and ends at 11:59 P.M. -- written in bold text.

Newton: Built-In Help (7/93)

==========

Article Created: 30 July 1993

TOPIC----------

Does the Newton MessagePad have built-in Help?

DISCUSSION----------

Yes, Newton has a built-in How-To Library. To use it, follow these steps:

1) Make sure no text is selected, then tap Assist.

2) Tap How Do I?, then tap the topic you need to know about. Subtopics will appear beneath that heading. Tap the most relevant one.

4) Read the information provided, and follow the directions. Newton will show you pictures and guide you step-by-step through specific tasks.

5) If you want to look at more topics, tap Topics. If not, tap the X.

Topics Covered By Newton's How-To Library

How Do I:

- Write
  - Interpret handwriting
  - Correct text
  - Delete and insert text
  - Change text styles
  - Move items to a different area
  - Use the on-screen keyboard

- Draw
  - Interpret drawings
  - Select drawings

- Touch up drawings
- Move items to a different area
- Delete a drawing
- Duplicate items

- Use the Names File
  - Find information
  - Make a phone call
  - Change Names File information
  - See and print the Names File
  - Change a card's appearance
  - Sort cards

- Use the Datebook
  - Move around in the Datebook
  - See today's appointments or To Do items
  - Make an appointment
  - Set an alarm
  - Schedule a repeating event
  - Add a To Do item
  - Delete a To Do item
  - Complete a To Do item

- Work with the Intelligent assistant
  - Use Assist
  - Use Assist from the Notepad
  - Make an Appointment
  - Call someone
  - Print something

- Organize and find information
  - Search everywhere for information
  - Tag (categorize or file) notes and names
  - View names or notes by tag
  - Create or rename a tag
  - Store information on a card

- Print, fax, or exchange information
  - Examples of things you can print or fax
  - Print something
  - Fax something
  - Save something to print or fax
  - Print or fax a saved item
  - Send information to another Newton
  - Receive information from a Newton

- Learn more (Miscellaneous)
  - Investigate the Extras Drawer
  - Use the Calculator
  - Use the World Clock (Time Zones)
  - See the current time and date
  - Find out the status of the battery
  - Set preferences

Newton: Can I Convert Handwriting After Writing? (6/94)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 23 June 1994

TOPIC -----

If I write a note on the Newton MessagePad with the text recognizer turned off, can I turn on the recognizer and convert the handwriting to text?

DISCUSSION -----

With the original Newton MessagePad, you can only convert your handwriting to text if the text recognizer button is darkened while you write. Whatever you write while the button is turned off cannot be converted into text later.

The Newton MessagePad 100 and 110 can convert handwriting to text at any time with a feature called Deferred Recognition. To utilize this feature, simply tap twice on each word you wish to convert. You may also convert several words at once by first highlighting them and then tapping twice on the words.

Article Change History:
22 June 1994 - Updated to include information on Deferred Recognition feature of the MessagePad 100 and 110.

Newton: Deleting A Single Character (7/93)

Revised: 7/29/93
Security: Everyone

Newton: Deleting A Single Character (7/93)

==========

Article Created: 30 July 1993

TOPIC--------------------

I keep trying to scrub out a single character in a word, but Newton always thinks I'm adding a new letter. Do I scrub out the whole word and start over, or can I scrub out one character at a time?

DISCUSSION--------------------

Yes, you can scrub out a single letter within a word or even a single blank space. Simply draw at least four lines vertically through the character without lifting the stylus. For best results, use short, precise strokes.

Newton Messaging Card: Description (7/93)

Revised: 11/15/93
Security: Everyone

Newton Messaging Card: Description (7/93)

==========

Article Created: 30 July 1993
Article Reviewd/Updated: 15 November 1993

TOPIC ----------

This article descibes the Newton Messaging Card.

DISCUSSION ----------

The Newton Messaging Card allows Newton to work like a pager. It connects to existing wide-area paging systems, allowing numeric and text messages to be received. With the Messaging Card, Newton can receive information such as meeting confirmations, news and other services.

The Messaging Card is a PCMCIA type II card, like Newton's RAM storage cards.

Hardware

The Messaging Card measures 0.2" x 2.2" x 3.4" (5 x 55 86 mm) with a 0.6" x 2.2" a 1.1" (15 x 55 x 28 mm) extension. It fits just over the top of Newton, and slides into the PCMCIA slot.

The card has 128 KB of static RAM (SRAM) storage space.

The Messaging Card is a single-frequency receiver in the 929-932 MHz frequency band and features a built-in antenna.

The card is compatible with all standard POCSAG protocols including both 7-bit and 8-bit messaging formats and will be available with 512, 1200, or 2400 baud code speeds.

The card comes with a AAA battery which will supply power for more than 21 days. The internal backup battery protects data when the main battery is low or being replaced. The backup battery should be replaced once a year. When the main battery is low, the user receives audio and visual notice to replace it.

The card has an On/Off switch, a transducer, and a multicolor status indicator. A flashing green LED indicates unread messages, and a flashing red LED indicates a low battery. An audible alert indicates that radio-frequency (RF) information has been received or a low-battery condition has been detected. The card will also alert you when you are out of paging range.

You can set the kind of audible alert you want the card to give you upon receiving messages.

Software

The Messaging Card supports 512, 1200, and 2400 baud POCSAG signaling. The card can detect as many as four POCSAG addresses. Each address is capable of responding to four functions, and each function has a total of 32 subaddresses. There are 16 combinations of addresses and functions, each referred to as a source. Since each source has 32 subaddresses, the Messaging Card will respond to a total of 512 individual subaddresses.

The information supplied after the address can be either tone-only, 4-bit numeric, or 7-bit or 8-bit data. The card will also support OTA programming so the paging service provider can enable and disable the card's functions.

You can program different Messaging Cards with the same address and functions and thereby accomplish group call and subgroup call to send identical messages to each Newton with a Message card with that address.

Persistence is a new feature that defines how long a message can stay in the Message Card's memory. You can define a message's priority (persistence) and it will not be overwritten until all lower persistence messages have been erased.

There is no imposed restriction on the length or number of messages. The limit is defined by the available RAM.

A real-time clock can provide time-stamped messages.

Newton Connection Kit 1.0: Description (Discontinued)

Revised: 6/20/94
Security: Everyone

Newton Connection Kit 1.0: Description (Discontinued)

==========

Article Created: 30 July 1993
Article Revised/Updated: 2 December 1993

TOPIC -----

This article describes the Newton Connection Kit for Macintosh.

DISCUSSION -----

With the Newton Connection Kit for Macintosh v 1.0, you can connect your Newton to a Macintosh and view, edit, back up and synchronize information created on the MessagePad.

Version 2.0 will add the ability to share information between Macintosh desktop applications and a Newton MessagePad. You will be able to share MessagePad information such as notes, letters, names cards with common Macintosh desktop applications, and use these Macintosh applications to edit your MessagePad information.

The kit comes complete with software, a serial cable, and a handbook. The cable is the same as the Mini DIN-8 peripheral cable, but is black instead of gray.

You can connect your Newton to the Macintosh either through the Macintosh's serial port, or via LocalTalk over a network.

Synchronization

The Connection Kit automatically synchronizes information between the Newton and the computer. The information is stored by files and includes both data and applications.

The information in the Macintosh can be viewed and edited, then downloaded back to the Newton. Templates are used to view and edit the information, so you can do text-intensive work with a keyboard and move it directly to your Newton.

Synchronization creates three files. One is the Macintosh's view of Newton's

memory. An archive file keeps an accumulative copy of all files synchronized. A backup file keeps only those files which changed from the last synchronization. Any files created during synchronization can be restored back into Newton.

Install Package

This option allows Newton applications (packages) to be downloaded from the Macintosh into the Newton. Newton software can be distributed on Macintosh floppy disks, installed on the computer and then downloaded. The packages can be removed just as easily, using the Newton Memory preference button labeled "Remove Software."

Minimum Requirements

• A Macintosh SE/30 or later computer with at least 4 MB of RAM.

• Macintosh System 7 (version 7.0 or later)

• An Apple SuperDrive floppy disk drive

• A hard disk drive

Newton MessagePad Power Accessories: Description (7/93)

Revised: 7/29/93
Security: Everyone

Newton MessagePad Power Accessories: Description (7/93)

==========

Article Created: 30 July 1993

TOPIC -----

This article describes the Newton MessagePad power accessories.

DISCUSSION -----

Newton Power Adapter

The Newton Power Adapter is 3.5 watt, wall-mounted AC to DC power supply. It can be used to power a Newton MessagePad or the optional Newton Fax Modem.

The cable is 2 meters long and the plug blades are available to conform to the outlet demands of the country to which it is shipped. The U.S./Canada/Japan version has prongs projecting from the end, while the European version has prongs projecting from the back.

Newton Rechargeable Battery Pack

The Newton Rechargeable Battery Pack consists of four AAA Ni-Cd (Nickel-Cadmium) batteries connected in series, all enclosed in a plastic case. The terminal voltage will be 4.8 volts nominal and the cells should have a minimum capacity of 220 mAH.

The case will be keyed so the Newton MessagepPad knows that it is a Ni-Cd pack and so discharge appropriately.

A plastic cover is included with the Rechargable Battery Pack to cover the contacts and protect the terminals from shorting out when the pack is outside the Newton.

Newton Recharger

The Newton Recharger is an external, outlet-mounted, Ni-Cd battery recharger. The recharging time is at a "quick charge" rate as defined By the battery

manufacturer's specification.

The input power is universal 85-264V AC, 47-66 Hz for all versions. The wall plug (AC blade) is mounted for all versions:

- U.S./Japan/Canada
- European
- United Kingdom
- Australian

The recharger can quick-change four AAA Ni-Cd batteries which have a nominal capacity of 220 mAH. Quick charge rate is 66mA for these cells. Charge time should be approximately 5 hours.

A rechargeable battery pack and safety cover are included with the charger.

Newton Battery Booster Pack

The Newton Battery Booster Pack is an external case which holds eight size-AA alkaline batteries. The pack provides more than twice the battery capacity of the internal batteries. It has a flexible cord which connects the Booster Pack to Newton MessagePad's power port. A clip on the back allows for easy portability.

Tech Info Library Article Number:12777

Newton 1 MB and 2 MB Storage Cards: Description (2/96)

Revised: 2/12/96
Security: Everyone

Newton 1 MB and 2 MB Storage Cards: Description (2/96)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 12 February 1996

TOPIC ----------

This article describes the Newton 1 MB and 2 MB Storage Cards.

DISCUSSION ----------

The 1 MB Static RAM (SRAM) card and the 2 MB Flash Storage card allow users to backup Newton data or extend their Newton's on-line storage.

Write Protection

Like floppy disks, the storage card is equipped with a write-protect tab, which is a slide switch on top of the card. You will need a small pointed object, such as your Newton's stylus, to slide the switch.

To write-protect your card, slide the write-protect switch towards the outer edge of the card.

Capacity

The 1 MB card can hold up to 1,250 name cards (including the name, company, title, address and three phone numbers), 1,000 notes of up to 50 characters, and 2,500 calendar appointments at 20 characters, or 400 screens of uninterpreted text and drawings. It has about four times the capacity of Newton's built-in memory.

The 2 MB card can hold up to 2,500 name cards (including name, title, company, address, and three phone numbers), 2000 notes of up to 50 characters, and 5,000 calendar appointments at 20 characters, or 800 screens of uninterpreted text and drawings. It has about eight times the capacity of Newton's built-in memory.

When the card is in use, its available capacity can be monitored on Newton by tapping Memory under Prefs in the Extras drawer. You can also choose to have

items stored automatically to the card instead of Newton's built-in memory. To do so, check that box in the Memory Preferences window.

A new card will require initialization by Newton.

Note: The Newton Operating System automatically flattens and compresses all data, so capacity will vary.

Battery (for 1 MB card)

As a Static RAM card, the 1 MB card requires a battery to maintain the contents when it is not installed in Newton. A small, 3 volt lithium disk battery (Panasonic and Rayovac BR-2325) is installed in a sliding tray in the top of the card. A battery is included with the card.

The 2 MB card utilizes Flash memory technology, and so does not require a battery to maintain data when not installed in a Newton.

Article Change History:
12 Feb 1996 - Revised battery part number.
25 Jan 1996 - Added battery part number.

Newton: Disappearing To Do List Items (7/93)

==========

Article Created: 30 July 1993

TOPIC----------

I put several items on my To Do List and some of them have disappeared. Why did this happen?

DISCUSSION----------

You may have put some items on your Calendar instead of your To Do List. To Do List items do not appear on the Calendar page, just as Calendar items do not appear on the To Do List. To see the To Do List for a particular date, tap the To Do List button at the bottom of the screen.

Here's how to move any or all To Do items into the Calendar so you can see them at the same time as your scheduled appointments:

1) Select the items you want to move.

2) Drag them to the far left, right, or top of the screen, until they shrink.

3) Tap the button marked Calendar.

4) Drag the items to where you want them displayed.

Newton: Handwriting Recognition Tips (10/94)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 24 October 1994

TOPIC ----------

Here are some handwriting tips to help your Newton to recognize your handwriting.

DISCUSSION ----------

These handwriting tips will help your Newton to recognize your handwriting:

- Write capital letters and tall letters (such as t and l) so they are about as tall as the width between solid lines on Newton's screen. Lowercase letters should be about half as tall.

- Put a full character's width of space between words, but not too much; Newton may assume you want it to insert a tab.

- Write in straight lines. Use the lines on the screen as a guide.

- When dotting your i's, keep the dot close to the i.

- When crossing letters, make sure the cross is straight, not slanted, and that it does not cross any other tall letters that should not be crossed (such as h).

- Make parentheses taller than your tallest letters.

- Don't go back to a letter after you've written it to try to improve its legibility. Newton only understands a letter as it's written originally.

- Don't write too near the edge of the screen. Newton cannot sense the stylus on the screen's edges.

- Don't pause in the middle of a word.
- Write from left to right.
- Use thicker ink. Newton recognizes bold lines better. To change the thickness of the lines your stylus produces, go to the Extras drawer and tap Styles. Tap one of the bottom two squares on the far-right side.
- Keep punctuation close to the word it follows.
- Write colons and semicolons as tall as capital letters. Draw them from top to bottom.

Newton: How to Capitalize a Word (7/93)

Revised: 7/29/93
Security: Everyone

Newton: How to Capitalize a Word (7/93)

==========

Article Created: 30 July 1993

TOPIC--------------------

Will my Newton capitalize a word that it's recognized without opening the keyboard and retyping the whole word?

DISCUSSION--------------------

Newton will automatically capitalize words at the beginnings of sentences, but it can't automatically capitalize proper names, or sense when you intend an whole word to be spelled with all capital letters. You can, however, capitalize words or change their case after they have been recognized by your Newton.

To tell Newton to change the case of a letter:

1) Select the word.

2) Draw a vertical line (not with the selecting gesture) up through a letter you want uppercase, down through a letter you want lowercase.

To tell Newton to capitalize all the letters in a word or words:

1) Select the word or words.

2) Draw a line through the middle of the word; up for all caps, down for lowercase.

Security: Everyone

Newton: How to Setup Handwriting Recognition (10/94)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 24 October 1994

TOPIC -----

How do I setup my Newton to recognize my handwriting?

DISCUSSION -----

Your Newton will learn to recognize your handwriting gradually, but you have to teach it your handwriting style both letter by letter and word by word.

These steps will help your Newton recognize your handwriting:

- Teach the Newton to better understand your handwriting style.
- Teach the Newton how you write individual letters.
- Teach the Newton how you write entire words.
- Review the words in your vocabulary list.
- Review the Recognizers Preference list.

Be sure that the text recognizer button is turned on. The text recognizer button is at the bottom-left side of your Newton's screen, marked with an A. When it is on, it appears as a white A on a black background.

Handwriting Style

To teach the Newton to better understand your handwriting style, follow these steps:

1) Tap the Extras drawer icon at the bottom of the screen, then tap Prefs.

2) Tap Handwriting Style in the Preferences Menu.

3) Tap the button that best describes your handwriting under "My handwriting style is". You may find that "Mixed Cursive & Printed

works best, unless you exclusively use all-printed or all cursive writing.

4) Adjust the other preferences so they reflect your writing style. Drag the diamonds with the stylus to move them.

5) Make sure that the box at the bottom marked "Configure for guest user" is unselected.

Individual Letters

To teach Newton how you write individual letters, follow these steps:

1) Tap the Extras drawer at the bottom of the screen, then tap Prefs.

2) Tap Letter Styles in the Preferences Menu. You will see a dialog box which displays a particular letter, number or symbol written in several different styles. You can select which character to view at the bottom of the dialog box.

3) Select each character, then tap each of the samples and carefully watch how Newton draws the letter. Tell your Newton which style or styles you use most often, and which you use rarely. When you finish, tap the next letter, number or symbol you wish to train Newton to learn to recognize, and continue.

Entire Words

To teach Newton how you write entire words, follow these steps:

1) Tap the Extras drawer at the bottom of the screen, then tap Prefs.

2) Tap Handwriting Practice in the Preferences Menu. In this dialog box, your Newton will ask you to write a particular word and try to recognize it. The more words you practice, the more the Newton learns.

Reviewing your Personal Word List

To review the words in your personal word list, follow these steps:

1) Tap the Extras drawer at the bottom of the screen, then tap Prefs.

2) Tap Recognizers in the Preferences Menu, then click on "Review my word list".

- You may choose to delete words you rarely or never use, so Newton has fewer words to compare your writing to before it interprets.

- Add often-used words which don't appear in a dictionary, such as proper names, abbreviations and slang terms.

Recognizers

There are other choices in the Recognizers Menu that will aid handwriting recognition.

- For the best speed and accuracy, select the box next to "words in word lists" and deselect "words not in word lists." This limits the number of words Newton considers when recognizing text.

- Also, deselect as many of the other options such as "names," "telephone numbers," "dates," and "times of day" as possible. This will improve word recognition, particularly when writing in the Notepad and not using numbers.

  If you need to write a number in the Notepad and these options are deactivated, tap the screen where you want the number to appear, then tap the keyboard icon at the bottom of the screen, and type the number in.

Newton: Using the Newton Assistant (10/94)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 24 October 1994

TOPIC -----

How do I use the Newton Assistant?

DISCUSSION -----

The Newton Assistant is the intuitive part of Newton. You may ask it to do things for you using various key request words. These words may or may not be capitalized, and each has several acceptable synonyms. Here is a list of the request words, along with the action they take:

Request Word	Action
• call, ring, dial	Dial a phone number
• fax, fax it	Send the item on your screen as a fax (requires a Newton fax modem)
• find, find it, look for, search for, locate, locate it	Search for text
• mail, link, e-mail, mail this, send this	Send the item on your screen as electronic mail
• print, print it	Print the item on your screen (requires a printer)
• remember, remind, remind me, to do, don't forget to, don't let me forget, don't let me forget to do	Add a reminder to your to do list
• schedule, meet, meet me,	Add an appointment to your calendar

see, talk to,
breakfast (implies 7 a.m.),
lunch (implies noon),
dinner (implies 7 p.m.),
holiday (implies day note instead
of appointment); birthday, bday,
b-day, anniversary (all imply
a day note that repeats every year)

- time, time in, the time in, what time is it, what time is it in, what time, what is the time, what is the time in — Look up the time in another city

NOTE: You will often ask Newton to do something involving another person. For instance, you may write "lunch with Eric Tuesday." Newton will scan your Names File for Eric, and schedule lunch with him on the following Tuesday. The more complete your Names File, the more helpful the Assistant will be.

Requests in the Assist Drawer
---

1) Tap the Assist button on the bottom-right of your screen.

2) Tap Please, and choose the appropriate request word. After the request word, write as much information as you can -- such as where, when and with whom -- to direct Newton's action.

3) Tap the Do button.

4) In the confirmation slip that pops up, make any additions or adjustments to the information displayed.

5) Tap the confirmation button at the bottom of the window to tell Newton to follow through on your request (schedule, print, fax, mail, etc.).

Requests Outside the Assist Drawer
---

1) Write at least one word of your request, beginning with the request word.

2) Select your request, using the select motion.

3) Tap Assist. If Newton is able to decipher your entry, confirmation slip will pop up.

4) Make any additions or adjustments to the confirmation slip.

5) Tap the confirmation button.

Confirmation Slips

Each request, except for Time, has a confirmation slip. Here are some tips on using them:

• Tap the diamonds for suggestions for filling in blanks.

• Fill out all required information, then tap the confirmation button.

NOTE: The more information you offer Newton in the Assist drawer, the more complete the call confirmation slip will be.

Using the Assistant to Dial the Phone
---

1) Tap Assist.

2) Tap Please, then tap Call, or write an accepted synonym for Call (as listed above) in the blank. Write the name of who you want to call, and the person's number. Tap Do.

3) If you cannot remember the person's number, Newton will fill in the first number listed under that name in its file. If there is more than one number for that person, choose the number you want Newton to dial by tapping the diamond by the word phone. (Hint: If you include the word "home," "work," or "beeper," Newton will look up the proper number. For instance, if you write "call Elaine's beeper" or "call Elaine home," Newton will fill in the proper number in the blank.)

4) Tap Speaker to have Newton dial through its speaker or tap Modem to have Newton dial through the modem.

5) Tap Options to set the calling options, such as your access code for your electronic mail server or a credit card number to charge long-distances costs to.

4) Tap Call.

5) If you tapped Speaker in step 3, hold your Newton to the speaker of the phone. If the call does not go through, try turning the sound volume up under Preferences in the Extras drawer.

Using the Assistant to Fax
---

1) Tap Assist.

2) Tap Please, then tap Fax, or write an accepted synonym for Fax (as listed above) in the blank. Write the name of the person to whom you want to fax. Newton will look in the Names File for the person you list. Tap Do.

3) If the names card for that person has a fax number, Newton will fill in that blank on the confirmation slip. If not, fill it in yourself.

4) Select the box next to cover page if you want one. Tap Notes to write comments on the cover sheet.

5) Tap Options to enter a credit card number to charge any long-distance

costs.

6) Tap Preview to view the fax as it will be sent. Tap Fax if everything is correct.

Using the Assistant to Mail
---
1) Tap Assist.

2) Tap Please, then tap Mail, or write an accepted synonym for Mail (as listed above) in the blank. Write the name of the person you want to mail the item to. Newton will look in the Names File for the person you list. Tap Do.

3) If the Names card for that person includes a electronic mail address, it will fill in that blank on the confirmation slip. If not, fill it in yourself.

4) Fill in the subject blank.

5) Tap the diamond next to format and choose a style.

6) Tap Preview to view the message as it will be sent.

7) Tap Mail to mail the message now.

8) Tap Mail Later to mail the message later. The item will wait in the Out Box in the Extras drawer until you tap it later to send it.

Using the Assistant With the To Do List
---
1) Tap Assist.

2) Tap Please, then tap Remember, or write and accepted synonym for Remember (as listed above) in the blank. Write what you want to remember to do. Tap Do.

3) Scrub out the date and time on the confirmation slip, and write in the date on which you want the reminder to appear.

4) Tap Do.

Using the Assistant to Print
---
1) Tap Assist.

2) Tap Please, then Tap Print. Tap Do.

3) Tap Printer to select a printer.

4) Tap Format to choose a style.

5) Tap Preview to view how the item will be printed.

6) Tap Print.

7) If your Newton is hooked to a printer, the item will be printed. If not, It will be put into the out box. When your Newton is hooked up to a Printer, go to the out box and print the item from there by tapping it.

Using the Assistant to Schedule an Appointment

1) Tap Assist.

2) Tap Please, then tap Schedule, or write an accepted synonym for Schedule (as listed above) in the blank. Be as specific with the synonym for Schedule as you can; for instance, if you want to schedule a lunch date, write lunch. You may write who you want to schedule the appointment with in the blank, or the date of the appointment.

   Remember, the more you write in the blank, the more fully Newton can complete the confirmation slip.

3) Scrub out the date on the when line of the confirmation slip and enter the correct date and time. Tap the diamond to see how Newton interpreted what you wrote. You may need to double tap the when line to use a keyboard to write the date and time.

4) You may fill in any or all of the other blanks for the location and subject of the appointment or with whom you are having the meeting.

5) Tap Schedule.

Using the Assistant to Determine the Time or Time Zone

1) Tap Assist.

2) Tap Please, then tap Time, or write an accepted synonym for Time (as listed above) in the blank. Write the name of the city you want to know about. Tap Do.

3) Newton will open the time zone map and show you the date and time in the city you've chosen. If the city you write in the blank is not in Newton's list, Newton will tell you it is unable to decipher your request.

Note: There is no confirmation slip for time requests.

Newton: Learning Your Handwriting (7/93)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 11 August 1993

TOPIC----------

How does Newton learn my handwriting?

DISCUSSION----------

Newton learns to recognize your handwriting by understanding the individual characters that you write. Newton examines the way you move your pen to form each character, then uses the Text Recognizers settings in the Preferences Menu to determine how to interpret them.

- If you have only selected "Words In word lists" in the Text Recognizers settings, Newton will only recognize words that are written in its word list. When you write a word, Newton will examine it and check the combination of letters against its word list; the best match is displayed on the screen. This option will provide the fastest and most accurate handwriting recognition.

- If you have only selected "Words not in word lists," Newton will attempt to recognize any letter or groups of letters that are written. In this case, Newton will not compare them to the word list.

- If you have selected both of these choices, Newton will interpret written characters, check them against the word list and display the best match.

Newton will continue to learn your handwriting as you continue to use it.

Newton: Maximizing Memory Capacity (7/93)

Revised: 7/29/93
Security: Everyone

Newton: Maximizing Memory Capacity (7/93)

==========

Article Created: 30 July 1993

TOPIC-----

This article discusses Newton's memory capacity and how to use it efficiently.

DISCUSSION-----

As you work with your Newton MessagePad, the items you enter will use space. To determine how much memory you have remaining, Check the "user data" in the Memory area in the Preferences menu area. If you fill up Newton's available memory, you cannot write anything new in Newton until you delete some of the old information, or install a storage card.

It is also best to store information as interpreted text. Text-only notes take an average of 0.2K each, and the average Names card takes about 0.4K. Handwriting that is not converted uses a third again as many bytes.

Another suggestion is to remove software applications that you rarely use and only reinstall them when you need to.

To remove software applications:

1) Insert a storage card to copy the software onto.

2) Tap the Extras button, then tap Prefs.

4) Tap Memory.

5) Tap Remove Software and follow the instructions on the screen.

Newton MessagePad: Description (7/93)

Revised: 7/29/93
Security: Everyone

Newton MessagePad: Description (7/93)

==========

Article Created: 30 July 1993

TOPIC ----------

This article describes the functions and capabilities of the Newton MessagePad.

DISCUSSION ----------

The Newton MessagePad uses Newton intelligence and communications technologies to help you do the following:

- Take notes
- Make a quick sketch
- Format and print letters
- Share and synchronize information with your personal computer
- Send a fax
- Receive pages and messages
- Tap into on-line services or electronic mail
- Exchange business cards with a colleague via built-in infrared technology

Newton weighs less than a pound, and is smaller than a VHS videocassette.

You can leave your notes handwritten or let Newton read your handwriting and transform it into typed text. If you prefer, you can type words using an on-screen keyboard. Drawings, handwriting and printed text can all be displayed on the same screen.

The Newton MessagePad can find a phone number and dial the phone for you, fax a note, format a letter, and even set up a lunch appointment.

The Newton MessagePad comes with built-in applications that include a notepad, to-do list, datebook, and name file to get you started. You can customize your Newton MessagePad to include Apple and third-party software and hardware additions.

FEATURES

Built-in Applications

- Let you capture, organize, and communicate information
- Allow free-form notetaking
- Track tasks via a to-do list that helps you assign priorities
- Let you create name files with a business-card look for hundreds people
- Help you plan monthly, weekly, and daily calendars
- Include information and productivity tools (such as time-zone maps, calculator, and currency-exchange formulas)

Communications Capabilities

- Send notes or messages, schedule appointments, or exchange business cards with other nearby Newton users via built-in, infrared beaming technology
- Print formatted letters and notes to serial and parallel printers
- Send faxes anywhere with an optional compact fax modem
- Receive and store wireless paging messages with the optional Newton Messaging Card
- Share information and keep files synchronized and updated with personal computers running Microsoft Windows or with Macintosh computers (requires Newton Connection Kit)
- Tap into electronic mail and on-line services with an optional compact fax modem

Intelligent Assistance

- Knows how you work and actively assists you in completing tasks
- Assists you in making phone calls, faxing, finding information, sending electronic mail, printing, scheduling meetings, and completing to-do lists

Newton MessagePad: Technical Specifications (7/93)

Revised: 7/29/93
Security: Everyone

Newton MessagePad: Technical Specifications (7/93)

==========

Article Created: 30 July 1993

TOPIC -----

This article discusses the technical specifications of the Newton MessagePad.

DISCUSSION -----

Newton Recognition Architecture

- Recognizes handwriting: printed, cursive, or mixed-word recognition
- Recognizes graphics and the inherent symmetry in objects

Newton Information Architecture

- Object-oriented data storage optimized for storing, finding, and linking small pieces of information
- Easy creation of custom forms applica tions via the flexible graphical view toolbox
- Easy data sharing using standard tags
- Object-oriented database provides flexible view of data

Newton Communications Architecture

- Provides single interface for all communication services
- Integrated to support easy communications with minimum setup requirements
- Designed in modules to support new communications capabilities

Intelligent Assistance Architecture

- Assists users in completing repetitive tasks done in multiple categories, including communications, scheduling, finding, and reminding functions
- Contains smart defaults to reduce complexity
- Functions across applications transparently
- Allows extensions by third-party developers

Newton Hardware Architecture

- ARM 610 processor at 20 MHz
- Apple custom system ASIC
- Low-power, reflective LCD display (336 x 240 pixels)
- Transparent tablet with passive pen
- 4MB of ROM
- 640K of RAM
- One PCMCIA Type II card slot
- LocalTalk-compatible serial port
- Low-power, half-duplex, infrared transceiver (9600 baud at 1 meter)

Communications Capabilities

- Print to Apple LaserWriters and StyleWriters with serial cable and to popular parallel printers using Newton Print Pack
- Fax with optional fax modem (9600 baud fax send, automatic cover-page generation, post-formatting)
- Beam via infrared technology (send notes, name cards, appointments at 9600 baud with 1-meter range)
- Handle telephony needs with assistance for intelligent auto dialing (DTMF or modem dialing)
- Receive and store wireless messages using optional Messaging Card
- Send and receive NewtonMail to other Newtons, PCs and Macintosh computers with optional modem (this service will be available in the fall of 1993.)

Size and Weight

- Height: 7.25 in. (184.75 mm)
- Width: 4.50 in. (114.3 mm)
- Depth: 0.75 in. (19.05 mm)
- Weight: 0.9 lb. (0.4 kg)

Operating Environment

- Temperature: +0 to +40 C
- Storage temperature: -20 to +60 C
- Humidity range: 20 percent to 95 percent RH noncondensing

Power Requirements

- Power adapter:
  - -- Universal, 100 to 240 VAC, 50/60 Hz
  - -- Four plug configurations: U.S., U.K., Europe, and Australia
- Battery type: alkaline or nickel-cadmium
  - -- Alkaline output: 6.0V DC, 1.1 WH (nominal)
  - -- Nickel-cadmium output: 4.8V DC, 200 mAh (nominal)
- Lithium cell: DL2032
- Operating range: 3 V (nominal)
- Power source: AC adapter (included) or four AAA batteries (included) and optional Rechargeable Battery Pack

Connecting Kit System Requirements

- Works with personal computers running Microsoft Windows; requires connector cable and version 3.0 or later
- Works with Macintosh personal computers; requires connector cable and system 7.01 or later

Printer Support

- Built-in printer support for the Apple StyleWriter and StyleWriter II, Personal LaserWriter LS and Personal LaserWriter 300 printers, and Apple PostScript laser printers from the LaserWriter Plus and up
- Works with most popular PC printers, including the Hewlett-Packard LaserJet, Hewlett-Packard DeskJet, Canon BubbleJet, and Epson LQ and FX using the Print Pack option

Fax Machine Support

- Supports Group 3 fax machines

Newton: Can I Modify Graphics Without Redrawing? (7/93)

Revised: 7/29/93
Security: Everyone

Newton: Can I Modify Graphics Without Redrawing? (7/93)

==========

Article Created: 30 July 1993

TOPIC--------------------

Can I modify or move graphics without redrawing them?

DISCUSSION--------------------

To change the shape of a graphic you have already drawn, put a selection box around it. Now you have several options for changing the appearace of the drawing:

- To move or change a line, drag it with the stylus.
- To move the entire drawing, place the stylus in the middle and drag it to a new location.
- To shrink, enlarge, or distort a drawing, drag the corners of the selection box.
- To change the thickness of the lines of the whole graphic, you may either box select the whole drawing, or just the lines you want to change. Then tap the Styles icon in the Extras drawer and choose the line thickness from the four examples on the right side of the Styles window.

Newton: Moving Items Between Applications (7/93)

Revised: 7/29/93
Security: Everyone

Newton: Moving Items Between Applications (7/93)

==========

Article Created: 30 July 1993

TOPIC-----

How do I move items between applications in my Newton?

DISCUSSION-----

You will often need to move items you've written from the original application to another. For instance, if you written a note titled "call Mike," you may want to move it into the Calendar or the To Do List.

To move a item to another application:

1) Select the item you want to move.

2) Hold the pen inside the selection and drag it to the top, left, or right edge of the screen. The item should shrink when you let go, indicating it is ready to be transferred.

3) Open the application to which you want to move the item.

4) Drag the item to where you want it stored, and let go. The item should expand to its previous size.

Note: To move notes from the Notepad into the Names file, it is a good idea to move each element separately. For instance, move the first name, then the last, then the phone number, and so forth. This way, you won't have to select and move parts of the item within the destination application.

Newton: Scrubbing and Deleting (7/93)

Revised: 7/29/93
Security: Everyone

Newton: Scrubbing and Deleting (7/93)

==========

Article Created: 30 July 1993

TOPIC----------

How do I delete items by scrubbing on my Newton?

DISCUSSION----------

You can delete items on your Newton by writing over them with a zigzag scrubbing gesture, like a W. This is called scrubbing.

Here are some hints to improve the effectiveness of your scrubbing:

- Newton prefers scrub marks to be in neat, horizontal or vertical zig-zag back-and-forth horizontal lines that cover the characters, words, or drawings you want to erase.

- Your zig-zags or horizontal lines must have at least four lines, as in a W. The bigger the thing you erase, the more lines you should use in your zig-zag or back-and-forth gesture.

- Do not draw zig-zags that loop or that cross over themselves.

- Wait a moment after you write something before you attempt to scrub it out.

- Make sure you begin scrubbing outside the item you want to erase to avoid moving it.

Deleting an Entire Page

Your deleting options will vary depending on which application you are using.

In the Notepad and the Names file:

1) Tap the Action button, located in the upper-right corner of the screen in

the Notepad and in the bottom-right corner of the Names File.

2) Tap Delete and the page will crumple up and be thrown away.

In the Datebook:

- You can scrub out all the appointments on a single date. You may also want to scrub out the vertical meeting-length line next to the appointment, if there is one.

- If you want to delete records of past days' meetings:

1) Tap the Action button, then Tap Delete. A dialog box will appear asking you to indicate how old the meetings you wish to delete are.

2) Write in the number of days back you wish Newton to begin deleting your appointments. Note that Newton will delete everything from the earliest records up to the date you indicate.

Deleting a Single Item in the Datebook

You may delete a single item from the Datebook by scrubbing, as described above, or by tapping the meeting-length bar and tapping Delete on the form that pops up.

Deleting a Single Character

To delete a single letter within a word or even a single blank space, draw at least four lines vertically through the character without lifting the stylus. For best results, use short, precise strokes.

Newton Fax Modem: Description (4/97)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 22 April 1997

TOPIC ----------

This article describes the External Newton Fax Modem.

DISCUSSION ----------

The External Newton Fax Modem is an external 2400 baud data/9600 baud send fax/4800 receive fax modem for the Newton MessagePad.

The data modem is Hayes AT command set compatible. The fax modem conforms to a Group 3 standard.

Domestic and International Models

There are two models: A U.S./Canada/Japan model and an European model.

The U.S/Canada/Japan model has a RJ-ll plug built into the modem.

The European model has a country-specific cable with a male RJ-11 plug on one end and the appropriate country telephone connector on the other. The data access arrangement (DAA) pods which are typically seen on other Apple modems are integrated into this cable.

Power

The Newton External Fax Modem is powered by two AA batteries or by a Newton power adapter. The adapter is plugged into the fax modem, so the fax modem never draws power from the Newton MessagePad.

Features

The Newton OS has built-in send fax software that allows you to personalize

cover sheets to include your name, phone and fax numbers, notes, and destination information.

From your Newton, you can control the modem sound volume, the time for the modem to wait for another fax machine to answer, and the time to wait for a dial tone. You can also select between pulse or tone dialing.

Dialing options allows the user to set the area code, prefix (to get an outside line in a PBX phone system), access code for a long-distance carrier, and your credit-card number.

Newton OS 2.x includes receive fax capabilities. The in/out box contains an integrated fax viewer, which provides zoom in/out views, rotate, and printing.

Newton: How to File Items In Folders (7/93)

==========

Article Created: 30 July 1993

TOPIC----------

This article discusses how to use Newton's filing system to file items in folders.

DISCUSSION----------

You may file any Notepad or Names File item you've written in a folder. If you don't file an item, it is saved in the folder marked "Unfiled" or "None." You may file an item in more than one folder.

Filing Items

To file notes and file cards:

1) Tap the folder icon at the top-right of the note or bottom of the card you want filed.

2) Tap the name of the folder in which you'd like to store the item.

3) Tap File.

Note: When you are viewing All Folders, each item's separator bar will indicate which folder it is in. On Name cards, the folder it resides in is indicated at the top of the card.

If you see a triangle in the folder icon, it means that the item you are viewing is stored on a memory card.

Creating New Folders

You may create new folders and title them yourself. To do this:

1) Tap the folder icon at the top-right of any note or bottom of any card.

2) Tap Edit Folders.

3) Write the name of the folder you want to create in the blank.

4) To create another new folder, tap the hyphens below the existing folders in the list under Edit Folders. You may have as many as 12 folders.

Deleting Folders

When you delete a folder, the items inside are moved to the Unfiled folder. To delete a folder:

1) Tap the folder icon at the top-right of any note or bottom of any card.

2) Tap Edit Folders.

3) Tap the folder you want to delete.

4) Scrub out the folder's title.

Changing the Names of Existing Folders

You may change the names of some folders in Newton's list. Newton comes with four named folders (Business, Important, Miscellaneous, and Personal). Newton also has two categories for tracking notes and cards: one for notes or cards that you haven't yet assigned to a folder (Unfiled or None) and one for viewing all filed and unfiled notes or names simultaneously (All Notes or All Names). You cannot change the names of these categories.

To change the name of any other existing folder:

1) Tap the folder icon at the top-right of any note or bottom of any card.

2) Tap Edit Folders

3) Tap the name of the folder you want to retitle.

4) Scrub out the name and write in a new one.

Putting Several Related Items in A Folder At Once

You can use the Find button at the bottom of Newton's screen to file related items together:

1) Tap Find.

2) Tap key words that link the items together, such as a company name, meeting notes, etc.

3) You can search everywhere by tapping All or only the application you are in by tapping Find.

4) Newton will show a list of all the items containing the words you searched for.

5) Tap the folder icon at the top-right of the list and tap the appropriate folder.

To View Contents of a Folder, All Notes, or All Names
---

1) Tap the folder tab with the diamond at the top-center of the screen.

2) Tap the folder you want to view. If you want to view the contents of all folders, tap All Notes or All Names. To view all unfiled notes or names, tap that option.

Note: If you create an item while inside a folder, the new item will automatically be stored in that folder. If you create a new item while viewing All Notes, All Names, Unfiled Notes, or Unfiled Names, the new item will go into the Unfiled folder.

Revised: 7/29/93
Security: Everyone

Newton: Using the On-Screen Keyboards (7/93)

==========

Article Created: 30 July 1993

TOPIC--------------------

This article explains the functions of Newton's various on-screen keyboards.

DISCUSSION--------------------

Newton uses several keyboards to allow you to enter information that Newton can't interpret through your handwriting, or words that you have not added to your Personal Word List.

Some Newton users may find it easier to use the keyboards to enter information such as dates, times, phone numbers, abbreviations or acronyms.

There are six keyboards on Newton: a standard keyboard, a correction keyboard, your Personal Word List keyboard, a phone number keyboard, a time keyboard, and a calculator.

Finding the Right Keyboard

You may access the standard, phone number, time, and calculator keyboards by tapping the keyboard icon at the bottom of Newton's screen in the Notepad. To look through the available keyboards, keep tapping the keyboard icon.

If you only want the standard keyboard, you may also tap the Extras button, then tap the keyboard icon there.

For the correction keyboard, double-tap the word you want corrected.

There are two ways to access the Personal Word List keyboard:

1) Tap the Extras drawer.

2) Tap Preferences.

3) Tap Recognizers.

4) Tap the button marked "Review my word list."

Or you may find the Personal Word List by opening the standard or correction keyboard and tapping the book icon in the bottom-left corner of the keyboard.

How to Write Using the Keyboards

- On the standard, phone, and time keyboards:
  Tap the area you want to place the cursor to begin writing. As you type, the characters will appear where the cursor is blinking.

- On the correction keyboard:
  The characters you type will replace what you double-tapped.

- On the Personal Word List keyboard:
  This keyboard allows you to modify your Personal word list to help Newton understand you better. Write a word and tap Add, or tap a word in the list and tap Remove.

Newton MessagePad: What Causes a " Cloud" on Screen (7/93)

==========

Article Created: 30 July 1993

TOPIC----------

Whenever I delete something on my Newton MessagePad, I see something like a billowing cloud appear on my screen. Does that mean something's wrong?

DISCUSSION----------

No. The graphic representation of a billowing cloud is confirmation that you have successfully deleted an item.

Newton: Changing Text Styles (7/93)

Revised: 7/29/93
Security: Everyone

Newton: Changing Text Styles (7/93)

==========

Article Created: 30 July 1993

TOPIC--------------------

How do I change the font and point size that my Newton MessagePad uses to display my interpreted words?

DISCUSSION--------------------

Newton will allow you to change the styles of any words you have stored. You have a choice between two slightly different fonts, and point sizes ranging from 9 to 18. Anything larger or smaller would be impractical on the small screen.

To change the style of something displayed on your screen:

1) Select the words you want to change.

2) Tap the Extras button, the tap the Styles icon.

3) Tap your desired text font and sizes.

You may also set the text styles of new entries before you write them. Make sure nothing is selected when you tap your text style preferences. All new text you enter will appear in this new style.

If the Styles box blocks your view of the text you are working with, you can move the box by dragging it by its gray border.

Newton: Using Time Zones (7/93)

Revised: 7/29/93
Security: Everyone

Newton: Using Time Zones (7/93)

==========

Article Created: 30 July 1993

TOPIC -----

What does the Time Zones function do and how do I use it?

DISCUSSION-----

The Time Zones function allows you to set your current time zone in your Newton MessagePad and to check the time zones around the world.

To tell Newton the time zone you are in:

1) Tap the Extras button at the bottom of the screen.

2) Tap "Time Zones."

3) Tap the circle between the up and down arrows at the bottom of Newton's screen. A list of cities appears.

4) Tap the nearest city to your own.

5) Tap the "I'm Here" button, and Newton will place the circle locator there, and list the time and date.

To determine the time in another city:

1) Tap the Extras button at the bottom of the screen.

2) Tap "Time Zones."

3) Tap the circle between the up and down arrows at the bottom of Newton's screen. A list of cities appears.

4) Tap the city you want to know about.

5) Newton will place the square locator there and list the city's name, time, and date. Just below the map, Newton displays the distance between your location and the city you chose.

You may tell Newton when you change your time zone while traveling by following the steps above, choosing your destination from Newton's list and tapping the "I'm Here" button.

Remember to change the time zone back when you return to your home time zone after your travels. If you do not change your time zone, but change the date and time instead, Newton's time zone settings for the rest of the globe will be off.

Newton: Notes Can Be Larger Than One Screen (7/93)

==========

Article Created: 30 July 1993

TOPIC--------------------

When using Newton's Notepad, can a note be larger than one screen?

DISCUSSION--------------------

A single note can be any size from a fraction of the screen size to several screens long.

Here are two ways of getting more writing space after you fill a Notepad screen with information:

1) If you've made a new note between two other notes, drag downward the separator bar below your note.

2) If you are writing on the last note in the Notepad, tap the down arrow below the bottom of Newton's screen.

You can continue either of these methods until your Newton runs out of memory.

Newton: Interpreting Punctuation As Letters (7/93)

==========

Article Created: 30 July 1993

TOPIC----------

When I write a sentence with a period at the end or a comma in the middle, Newton interprets the punctuation mark as the letter "l" or as an accent mark or hyphen. How can I make it differentiate between these marks?

DISCUSSION----------

To help Newton understand your punctuation marks better, particularly commas and periods, make certain you have placed them close to the word they follows. If Newton interprets them incorrectly, you are probably leaving too much space between punctuation and the words associated with it.

Newton MessagePad: Out of Memory (7/93)

==========

Article Created: 30 July 1993

TOPIC -----

My Newton MessagePad gave a message saying it was out of memory. What do I do?

DISCUSSION -----

If you got an out of memory message while adding text to a paragraph, you may not actually be out of memory. Try copying the paragraph and deleting the original.

If not, you need to provide more memory for Newton with a storage card, or delete some of the information in Newton's memory that you no longer need.

Newton MessagePad: Screen Problems (7/93)

==========

Article Created: 30 July 1993

TOPIC -----

This article discusses remedies to some Newton MessagePad screen problems.

DISCUSSION -----

Here are some remedies for common Newton screen problems:

- If the screen on Newton is too light or dark, you can adjust the contrast. To do this, open the Extras drawer and slide the gauge at the bottom marked "Contrast."

- If you are getting a reflection on the screen, move somewhere where there isn't a light source directly overhead.

- If you are getting long, spidery lines on your screen, you may be resting your hand too heavily on the screen.

Newton: How To Select (7/93)

Revised: 7/29/93
Security: Everyone

Newton: How To Select (7/93)

==========

Article Created: 30 July 1993

TOPIC----------

This article discusses how to select, or highlight, items on Newton's screen.

DISCUSSION----------
Selecting on the Newton is different from selecting on a computer, since there is no mouse.

To select on the Newton, hold the stylus down on the screen (you don't have to press hard) until you see a heavy dark spot beneath it. Then, drag the point of the stylus across the screen over the items you want highlighted. To deselect, tap the screen away from the selection.

Detail selection is the selection of individual items. Here's how to detail select:

- To select text that covers more than one line, drag the stylus from the first word to the last using the highlighting mark.

- To select several lines of text, drag down through the lines you want highlighted.

- To select shapes, drag through the shape in a straight line using the highlighting gesture. To select a portion of a shape, drag only along the lines you want highlighted.

Box selection is the selection of a group of objects. Here's how to box select:

- Using the same highlighting motion as mentioned above, draw a box around the items you want to select.

- You may also select more than one thing. If they are far apart, you may select one at a time. Other items remain selected when you select a new

item.

Note: If two or more items are selected, Newton will place a highlight box around them. Other objects which you have not selected may appear within the borders of the box. However, only those that appear highlighted (whites letters or lines on a black background) have been selected.

Newton: How to Set the Date and Time (7/93)

==========

Article Created: 30 July 1993

TOPIC----------

This article discusses how to set the date and time on your Newton.

DISCUSSION----------

To set the date:

1) Tap the Extras buttonat the bottom of Newton's screen, then tap Prefs.

2) Tap Date and Time.

3) To set the month and year, use the arrows at the top of the calendar to scroll through.

4) To set the day, tap the current date on the calendar.

To set the time:

1) Tap the Extras button at the bottom of Newton's screen, then tap Prefs.

2) Tap Date and Time.

3) Draw a long hand and a short hand in the proper positions on the analog clock shown. Be sure your long hand reaches the border of the clock, and your short hand is about half the radius of the clock face.

4) Tap the Set button.

Newton: Slowing Text Interpretation (7/93)

==========

Article Created: 30 July 1993

TOPIC--------------------

My Newton begins interpreting what I have written while I'm still writing. Is there a way to slow this feature down so I can finish a thought before Newton starts converting it to text?

DISCUSSION--------------------

If Newton is interpreting your handwriting too quickly, here's how to slow it down:

1) Tap the Extras button, then tap Prefs.

2) Tap Handwriting Styles in the Preferences Menu.

3) Select one of two ways to slow down handwriting interpretation. Either:

- Slide the diamond on the second guage to the left toward "slowly, more accurately."

or

- Slide the diamond on the third guage to the right toward "after a delay."

The longer you give Newton to think about what you write, the more accurate its interpretation will be.

Newton: Text and Graphics Recognizers (7/93)

==========

Article Created: 30 July 1993

TOPIC--------------------

This article discusses using the text and graphics recognizers.

DISCUSSION--------------------

The text recognizer button is the one at the bottom-left side of Newton's screen, marked with an A. When it is on, it appears as a white A on a black background.

The shapes recognizer button is beside it, marked with a curlicue and a triangle.

Generally, you should only have one recognizer on at a time. If you need to use both text and graphics at the same time, turn on the text recognizer when you are writing, and turn it off when you are drawing. Keeping both recognizers on will slow Newton, and make it interpret more items incorrectly.

If either or both recognizers are turned off, you will still be able to see any text or graphics on the screen.

Newton: How Does Undo Work? (7/93)

==========

Article Created: 30 July 1993

TOPIC--------------------

How does Newton's Undo function work?

DISCUSSION--------------------

You can Undo your last two actions if you were writing any item or performing a function, such as Delete or Duplicate. You cannot Undo more than your last two actions.

If you tap the Undo button once, you reverse the last action you made. Tapping twice will reverse the last two actions. If Newton cannot Undo your action, you will have to cut and paste or otherwise re-enter your data to restore or correct it.

Newton will notify you when you attempt to Undo something that cannot be undone. Some examples are:

- You cannot use Undo to close from an application you have opened. If you accidentally open an application, you must hit the X button in the lower-left corner or the screen.

- You cannot use Undo to close a window that Newton has opened for you if you change your mind.

- You also cannot Undo to undo a Restore.

Laserwriter Pro 630: Using with a SUN Workstation (8/93)

Revised: 8/9/93
Security: Everyone

Laserwriter Pro 630: Using with a SUN Workstation (8/93)

==========

Article Created: 3 August 1993

TOPIC ----------

I have the following problems when trying to use a Laserwriter Pro 630 from a SUN.

1) When printing a job in PCL mode, a control-D (often occurring in PCL downloadable font) terminates the print job. It appears from looking at a PDL file for the Laserwriter 8 drivers that this is reconfigurable. I would appreciate some more information on how to do this.

2) When using the switch 9 position and reconfiguring the serial port baud rate from 9600 to 19200 (non-volatile PRAM) the patch changes the baud rate, but upon restart defaults back to 9600. This isn't true in switch position 6. Is this a bug?

DISCUSSION ----------

Here are the answers to your questions:

1) We assume you're talking about the PPD files for LaserWriter 8.0. Reconfiguring CTRL-D in the PPD file isn't possible. The section we believe you're referring to in the PPD file is the section for starting/stopping the emulator (that is, *StopEmulator_hpcl: "<1B7F>0"). This specific line of code executes an ESC-DEL-0 (hex 1B = ESC, hex 7F = DEL) which only stops the emulator, and not the print job. A CTRL-D is still required to end the print job, and CTRL-D is specifically what the PostScript interpreter looks for. We are currently unaware of a way to "reconfigure" the CTRL-D string.

   As for the problem at hand, the print job should NOT be terminating with the CTRL-D character if the printer is configured for HP PCL 4 and the "RAW" protocol. The "RAW" protocol is defined as follows:

 * Raw: Lets all data pass through unfiltered. Control characters such as

End-of-file (CTRL-D) and status queries (CTRL-T) are passed through and not acted upon.

On page 125-126 of the LaserWriter Pro 600/630 manual, all of the switch settings for HP PCL on the various ports show "RAW" as the protocol, so we are a little confused why the print job is terminating. The only thing we can think of is that you are entering PCL mode via PostScript, as opposed to using one of the ports specifically configured for HP PCL. In this case, the protocol used would be Normal and not RAW.

2) We tried to reproduce this problem and were unable to. We used the LaserWriter Utility v7.4.1 to change the baud rates to 19200 on the Serial ports for switch positions 6 and 9, and the values persisted across power cycles. If you're changing the baud rates via PostScript code, then you want to be certain you're writing to the nonvolatile parameter set (that is, %Serial_NV4 as opposed to %Serial4). Thus, if you want to change the baud rate to 19200 for switch position 9 on the serial 25-pin port, then the following code will do this:

```
%%Begin
(%Serial_NV4%) <</Baud 19200>> setdevparams
%%End
```

By the way, the default baud rates for switch positions 6 and 9, are 19200 and 9600 respectively, so it appears that the problem lies in how the baud rate is being changed.

Columbo's Mystery Capers: Description (7/93)

==========

Article Created: 30 July 1993

TOPIC --------------------

This article describes Columbo's Mystery Capers, a Newton software application.

DISCUSSION --------------------

Columbo's Mystery Capers is a Newton-based software application which includes more than 40 mysteries complete with graphics and text-based clues. Each scenario opens with a text introduction and an illustration of the scene of the crime. Players use the stylus to uncover potential clues and solve the mystery.

Print Dialog Box: Select Color/Grayscale to Change Default

Revised: 8/9/93
Security: Everyone

Print Dialog Box: Select Color/Grayscale to Change Default

==========

Article Created: 3 August 1993

TOPIC -----

We want to modify the Print Dialog box and change the default to Color/Grayscale rather than the default Black & White. Can you provide us with the details? We're running System 7 and have LaserWriter driver 7.2 for the LaserWriter Pro 630.

DISCUSSION -----

The feature of selecting the default printing mode as either Black & White or Color/Grayscale is built-in on LaserWriter driver 7.2. Once either mode is selected in the Print dialog box and you print something, the mode "sticks" and becomes the default printing mode.

By the way, this feature is also present in LaserWriter driver 7.1.2 and 8.0.

Quadra 950: MicroNet Raven•040 Disk Array (9/95)

Revised: 9/21/95
Security: Everyone

Quadra 950: MicroNet Raven•040 Disk Array (9/95)

==========

Article Created: 2 August 1993
Article Reviewed/Updated: 21 September 1995

TOPIC ----------

MicroNet has several models called Raven•040. MicroNet Raven•040 Disk Array is model number Q9i/i-1030R.

This article tells you what to do if you turn on a Macintosh Quadra 950, see the happy Mac, but it doesn't boot and there's no "Welcome to Macintosh."

DISCUSSION ----------

Insert the Disk Tools disk. If it loads or boots, is the MicroNet hard disk icon visible below the Disk Tools Disk?

- If yes, then reinstall system software.

- If no, then you may need to reinstall the MicroNet drivers or reinitialize the disk. The Apple HD SC Setup program WON'T work. You must use the MicroNet Utility disk supplied with your system. The utility is too large to fit on a single floppy disk with enough system software to create a bootable floppy disk.

  You have two choices:

  - Connect another hard disk drive to the external SCSI port. Restart with the Disk Tools disk and then copy the Disk Tools to the hard disk. Restart, letting the system reboot from the hard drive. Run MicroNet's Utilities from the disk or copy them to the hard disk. See MicroNet's manuals for instructions on using their utilities.

  - You can run the utilities and the system from two separate disks (20 or more disk swaps may be necessary). This isn't recommended, but will work in an emergency when no external disk drive is available.

IMPORTANT: Close the Disk Tools window before choosing eject from the Finder Menu (an open window may keep the disk from ejecting without requesting the same disk back).

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Quadra 950: Blank Screen with SuperMac Thunder II Light (8/93)

Revised: 8/2/93
Security: Everyone

Quadra 950: Blank Screen with SuperMac Thunder II Light (8/93)

==========

Article Created: 2 August 1993

TOPIC ----------

When I power up my system, my monitor is blank.

DISCUSSION ----------

There are several things to check with SuperMac Thunder II Light when your screen is blank or displays garbage:

- Your monitor may be connected to the internal board (on-board connector), and not to the SuperMac board installed in one of the NuBus slots.

- Also, remove the cover and ensure that the SuperMac video card is properly seated in the NuBus slot.

- Hold down the option key and restart your Quadra 950. This will trigger SuperMac's system for cycling through all monitor sizes supported. When the image of the keyboard on the screen is clear and/or the name of your monitor appears on the screen, press the space bar. Your Macintosh will restart with the right screen settings.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Quadra 950 Publishing Configuration: Description (10/93)

Revised: 10/18/93
Security: Everyone

Quadra 950 Publishing Configuration: Description (10/93)

==========

Article Created: 2 August 1993
Article Reviewed/Updated: 18 October 1993

TOPIC ----------

This article describes the enhanced features of the Macintosh Quadra 950 Publishing Configuration.

DISCUSSION ----------

This configuration has SuperMac and MicroNet components built in. The SuperMac Thunder II 1152 card is in one of the NuBus slots, leaving four slots available for other cards. MicroNet built the Raven040 disk array specifically to use the Quadra's dual SCSI channel.

SuperMac Thunder II 1152 Card

The SuperMac card provides accelerated 24-bit graphics support on 21-inch monitors. It also accelerates QuickDraw to manipulate large color images more easily. The SuperMac Thunder II Light card also has dual Digital Signal Processors (DSPs) built in, enabling up to five times performance improvements on many Adobe PhotoShop functions.

SuperMac's Image Processing Accelerator also gives special acceleration to Adobe Photoshop. Other accelerated functions include Image Size, Rotate, Blur, Blur More, Sharpen, Sharpen More, Sharpen Edges, Despeckle, Find Edges, Emboss, Fragment, Feather, High Pass, Custom, Skew, Perspective. SuperMac also provides its own accelerated Motion Blur.

MicroNet1 Gigabyte Disk Array

The Quadra 950 has two on-board SCSI channels that provide a high-speed path for advanced disk drive systems called arrays. The Raven040 disk array combines the two 500MB drives into a single virtual drive. While one drive queues up data, the other one can send

data. This increases the transfer rate over 6MB per second, which is much faster than one drive operating alone.

Quadra 950 Standard Features

You get the following standard features of the Macintosh Quadra 950 in the Publishing Configuration:

- 33MHz Motorola 68040
- 256MB of memory expansion (no DRAM installed)
- 5 NuBus slots (one occupied by the SuperMac card)
- Built-in Ethernet connector
- Built-in video for a second monitor (ideal for 14-inch Macintosh Color Display)
- Room inside to add a 5.25-inch half-height drive, AppleCD 300i, or Syquest cartridge.

Service and Support for Bundled Third-Party Products

SuperMac will provide service and support for the Thunder II Light card and MicroNet Technology will provide service and support for its Raven 040 SCSI hard disk array.

Order Number

Macintosh 4MB Memory Exp. Kit (4-1MB SIMMs) M2499LL/A
AppleCD 300i Internal Drive Kit (Quadra 900 and 950) B1328LL/A

Installer Script	4.0.5	7/1/93	7/1/93
TeachText	7.1	11/24/92	11/24/92

QuickTime 1.6.1

The QuickTime system extension, version 1.6.1, is included with CD-ROM Setup 4.0.5. You must install the QuickTime system extension, version 1.5 or later to use Photo CD discs.

You must also install 32-Bit QuickDraw to use QuickTime. If you're

using System 6, install 32-Bit QuickDraw into your system software before installing QuickTime.

To install QuickTime 1.6.1:

1) Insert the QuickTime disk into the floppy disk drive.
2) Double-click the QuickTime disk icon.
3) Drag the QuickTime system extension onto your System Folder icon.
4) Click OK.
5) Restart your Macintosh.

Older Macintosh Models

The QuickTime system extension doesn't work on Macintosh models that contain a 68000 microprocessor (the Macintosh Plus, Macintosh SE, Macintosh Classic, Macintosh Portable, and Macintosh PowerBook 100). This system extension won't be installed with Easy Install. Apple Photo Access and Slide Show Viewer require QuickTime support, and therefore, doesn't work on the Macintosh models that contain a 68000 microprocessor as noted above. Apple doesn't recommend that you install these system extensions on these models.

AppleCD Speed Switch

The AppleCD 300i User's Guide incorrectly states that the AppleCD Speed Switch is a desk accessory. The AppleCD Speed Switch is actually a control panel. To open the Speed Switch Control Panel, choose Control Panels from the Apple menu and double-click the AppleCD Speed Switch icon.

Using Large Photo CD Images

Photo CD images are stored in folders according to their image size. For most work, images of 768 x 512 pixels or smaller will be suitable. For more detailed work, or for very high quality reproductions, you may want to use larger images.

You should open larger images with application programs designed to handle large PICT files. TeachText will have difficulty opening these large files.

New Version of TeachText

TeachText, version 7.1, is available on the CD Set-Up 4.0.5 disk. It will be installed on your computer if you install system software using Easy Install.

Using the Viewer With Several CD Discs in System 6

In System 6, if you want to view photos from more than one Photo CD disc, you shouldn't launch the Slide Show Viewer from the CD disc. Instead, copy the viewer to your hard disk, and use that copy to view photos. If you launch the viewer from the CD disc, you will experience

problems when you insert the next disc.

Color Icons and Low System Memory

Your Macintosh may have problems displaying color icons for the pictures on a Photo CD disc when the system is low on memory. When not enough memory (usually less than 200K) is available, some of the color icons for Photo CD documents may appear as plain document icons. This problem only affects the appearance of the icons; the actual Photo CD images themselves aren't affected. If this problem appears, you can restore the normal color icons by restarting the computer.

Network Software Installer 1.4.1: Software Components (11/93)

Revised: 11/19/93
Security: Everyone

Network Software Installer 1.4.1: Software Components (11/93)

==========

Article Created: 29 July 1993
Article Reviewed/Updated: 19 November 1993

TOPIC ----------

This article lists the software components for the Network Software Installer (NSI) 1.4.1.

DISCUSSION ----------

Product	Version	Notes
AppleTalk	58.1.1	
Network Control Panel	3.0.2	
AppleTalk Internet Router	2.0	Requires Router installation disk
EtherTalk	2.5.5	
Ethernet driver	1.0.4	For the Apple Ethernet NB Card
Ethernet driver	6.0.3	For the Apple EtherTalk NB Card
Ethernet driver	1.0.7	For the Apple Ethernet Twisted-Pair NB Card
Ethernet driver	1.0.7	For the Apple Ethernet LC Card
Ethernet driver	1.0.7	For the Macintosh Quadra 700, 900, 800, 950, Centris 610, 650 built-in Ethernet port.
Ethernet driver	1.0.1	For the Macintosh Quadra 840AV and Centris 660AV.
TokenTalk	2.5.5	
Token Ring Control Panel	1.0.1	
Token Ring driver	2.5.2	For the TokenTalk NB Card and Token Ring 4/16 NB Card.
A/Rose	1.2	

This installer works on either System 6 or System 7 Macintosh computers.

The Network Software Installer v.1.4.1 process correctly handles the installation of AppleTalk v58.1.1 and related software components on

Macintosh 840AVs and Centris 660AVs..

Restrictions

This software should not be installed with AppleTalk Internet Router and AppleShare client on a Macintosh with only 1 Megabyte of memory.

If this release of the Network Software Installer is being used in conjunction with an Apple Internet Router v. 3.0 Installer, Router 3.0 MUST be installed first. This will ensure that the Router installation does not overwrite the newer AppleTalk software contained on NSI 1.4.1.

Release notes for each item follows

- AppleTalk version 58.1.1
  Changes were made to the workstation's Best Router Table maintenance when talking to Routers that use a zero hop count.

- Ethernet for Ethernet NB Twisted Pair Card
  Support was added for the 1.0.7 Ethernet driver for the Ethernet NB Twisted Pair card.

- EtherTalk for EtherTalk NB
  Fixed a slowdown that occurred with EtherTalk NB cards while using DECNet.

- EtherTalk and TokenTalk version 2.5.5
  A change was made to the AMT table maintenance for supporting Router 3.0 (which uses 0 hop counts).

Article Change History:
31 Aug 1993 - Updated for NSI 1.4
19 Nov 1993 - Updated for NSI 1.4.1

Newton Connection Kit for Macintosh: Installing Packages (7/93)

Revised: 8/2/93
Security: Everyone

Newton Connection Kit for Macintosh: Installing Packages (7/93)

==========

Article Created: 30 July 1993

TOPIC -----

This article explains how to install a package onto Newton using the Newton Connection Kit for Macintosh.

DISCUSSION -----

A package is a file that adds features to your Newton. They may be applications, fonts, forms, collections of information or other software.

To install a package:

1) Connect your Newton to the Macintosh that has the package on it.

2) On your Macintosh, double-click the Newton Connection icon to open it.

3) Click the Install Package button.

4) In the box that appears, choose the package you want to install, and click Open.

5) Open the Extras drawer on the Newton.

6) Tap the Connection button.

7) In the box that appears, choose serial or AppleTalk to reflect the mode of connection you used when linking the Newton and Macintosh.

8) Tap Connect.

Newton Connection Kit for Macintosh: Restoring Data (7/93)

Revised: 8/2/93
Security: Everyone

Newton Connection Kit for Macintosh: Restoring Data (7/93)

==========

Article Created: 30 July 1993

TOPIC -----

This article discusses restoring information to your Newton from files saved to your Macintosh.

DISCUSSION -----

If you lose some or all of the information on your Newton, you can restore from the files created during synchronization with your Macintosh.

Note: Using the Restore function erases everything on your Newton and replaces it with the file from the Macintosh.

To restore:

1) Connect your Newton to your Macintosh.

2) Double-click the Newton Connection icon on the Macintosh.

3) Click the Restore button.

4) In the dialog box that appears, choose the file you want to restore, and click Open.

5) On your Newton, tap the Extras button.

6) In the box that appears, choose serial or LocalTalk.

7) Tap Connect to initiate restoration.

Restoring Specific Items

You may want to retrieve certain items from past synchronizations that no

longer exist in the latest synchronized file. You may use the Archive file to amend the latest synchronized file on the Macintosh, then synchronize again to transfer those changes to the Newton.

To do this:

1) On the Macintosh, choose Open from the Newton Connection File menu.

2) Open the latest synchronized file (It will be called either Newton or bear your name).

3) In the window that appears, click the application where you want to put the recovered information.

4) Choose Open from the File menu.

5) Open the archive that contains the information you want to recover.

6) In the window that appears, open the application that contains the information you want.

7) In the archive window, select the information you want to put back into your Newton. Choose Copy from the Edit menu.

8) Click the window of the synchronized file, then choose Paste from the Edit menu.

9) Synchronize with your Newton.

Newton Connection Kit for Macintosh: Installation (7/93)

Revised: 8/2/93
Security: Everyone

Newton Connection Kit for Macintosh: Installation (7/93)

==========

Article Created: 30 July 1993

TOPIC -----

This article discusses installing the Newton Connection Kit for the Macintosh and connecting your Newton to your Macintosh.

DISCUSSION -----

The Newton Connection Kit allows your Macintosh to communicate with your Newton. You can backup and restore Newton data, examine the data on your Macintosh and download Newton software applications to your Newton.

Installing the Connection Kit

Here's how to install the Newton Connection kit onto your Macintosh:

1) Insert the disk entitled, "Newton Connection Kit Install 1" into the floppy drive of your Macintosh.

2) Double-click the Installer icon.

3) Click OK in the welcome dialog box that appears.

4) In the Installer box, click Install.

5) Follow the instructions on the screen. Insert the disk entitled "Newton Connection Kit Install 2" when the program requests it.

Connecting to a Macintosh

There are two ways to connect the Newton to the Macintosh: via a serial cable or an LocalTalk network. The network connection is more complicated, but enables faster communication.

Here's how to connect with a serial cable:

1) Plug one end of the serial cable into your Newton.

2) Plug the other end into the printer port on your Macintosh.

Here's how to connect over a LocalTalk Network:

1) Make sure your computer is turned off.

2) Follow the instructions that accompanied your Apple LocalTalk kit to connect your Macintosh to a network if it is not already connected.

3) Plug the LocalTalk cable into the communications port on the lower-right side of your Newton.

4) Turn on your Macintosh and choose the Chooser from the Apple menu.

5) Make sure AppleTalk is active in the window that appears.

When you want to disconnect your Newton, remove the cable from the Newton communications port and leave everything else connected. When you want to re-establish the connection between your Macintosh and Newton, plug the cable in again.

Note: If you connect Newton to a PowerBook that has an internal modem, you need to open the PowerBook control panel and select the External Modem button to complete the serial connection.

Newton Connection Kit for Macintosh: Synchronizing (7/93)

Revised: 8/2/93
Security: Everyone

Newton Connection Kit for Macintosh: Synchronizing (7/93)

==========

Article Created: 30 July 1993

TOPIC -----

This article discusses synchronizing files between the Newton and Macintosh.

DISCUSSION -----

The first time the Newton Connection Kit synchronizes your Newton with your Macintosh, all the information from your Newton will be copied onto your Macintosh's hard drive. After the first time, synchronizing will copy only new or changed information from Newton to your Macintosh or vice versa. When synchronization is completed, the identical information exists both in the Newton folder on your Macintosh's hard drive and in your Newton.

When you synchronize, all information you deleted since the previous synchronization is stored in an Archive file on the Macintosh. The entire file left by the previous synchronization will be stored as a file called "Backup."

How to Set Up For Synchronization

To prepare the Macintosh for communication with the Newton:

1) Double-click the Newton Connection icon.

2) Choose Preferences from the Edit menu.

3) In the dialog box that appears, click on the method you used to connect your Newton and Macintosh. Click OK to save your preferences, and close the box. (You only need to do this the first time you use the Connection software, unless you change the setup.)

4) Click the Synchronize button. A message will appear to confirm that the Macintosh is ready.

To prepare the Newton for connection:

1) Tap the Extras button on Newton's screen.

2) Tap the Connection button.

3) Tap "Macintosh serial" or "Macintosh LocalTalk" to indicate how you are set up. (If you are using a serial cable, skip to the next section, titled Synchronizing.)

4) If you chose Macintosh LocalTalk, tap the Choose Macintosh button that appears.

5) A list of Macintoshes that are running Newton Connection appear. If the one you want is not listed, tap Change Zone and choose the proper zone (if your network doesn't have zones, this button will not appear). If the Macintosh you want does not appear, make sure the Connection software is launched on that computer.

6) Tap the Macintosh you want.

7) To begin synchronizing, tap Connect. To stop at any time, tap Stop.

The process will copy all the information that has changed since the last synchronization from your Newton onto the Macintosh's hard drive in a file that bears your name. If you haven't entered your name in your Newton, the file will be called Newton.

If you want to synchronize automatically, choose Preferences from the Edit menu and click "Always ready to synchronize."

Setting Up a Synchronization Station

If you use Newton Connection on a network with other Newton users, you may want to establish one Macintosh where everyone can synchronize and store their Newton files. To do this:

1) Make sure the chosen Macintosh is hooked into the network.

2) Open Newton Connection.

3) Turn on "Always ready to synchronize" in the Preferences box (in the Edit menu).

4) Always leave the station Macintosh on.

5) Make sure everyone who uses the station has his or her name entered in Newton's Personal area under Preferences in the Extras drawer. This ensures that everyone's synchronization files will be stored separately.

Newton Changes Take Precedence

Immediately after you complete synchronization, the information in the Newton

folder on your hard drive and on your Newton are identical. If you change the same piece of information in both places, when you next synchronize, the changes you made on the Newton will take precedence.

For instance, if you change Bob's address in the Names File on Newton, and Bob's title in the Names File on your Macintosh, both files will reflect Bob's new address, but not his new title. The changes you made on the Macintosh -- Bob's title -- will be saved into the Newton archive folder on the Macintosh.

At Ease 2.0: Description (8/95)

Revised: 8/9/95
Security: Everyone

At Ease 2.0: Description (8/95)

==========

Article Created: 2 August 1993
ARticle Reviewed/Updated: 9 August 1995

TOPIC ----------

At Ease 2.0 software is an extension to Macintosh System 7 that gives everyone who uses a Macintosh the resources they need without disrupting the files or applications of other users.

DISCUSSION ----------

Features

After you install At Ease 2.0, you can use the setup program to designate, for each user, which applications they can and can't access. You can also grant or deny permission for users to delete and copy files, make folders, and rename items. This gives each user privacy and prevents novice users from accidentally deleting files or applications or damaging the hard disk.

You can assign an individual password for each user. When the user enters the password, At Ease 2.0 displays all of the authorized applications as large buttons. A single click on these buttons launches the application or opens a document.

You can maintain a more orderly hard disk with At Ease 2.0. It stores all new files in a single document folder. You can also block saving files on the hard disk and require saving files on a floppy disk.

Components

At Ease creates many of these files and folders at run time:

• Documents
  - At Ease - provides the code for running the At Ease desktop, and is located at the root level of the System Folder.
  - Users - stores user information, and is located in the At Ease Users

folder.
  - User Profile - stores profile information for a particular user. It's in the At Ease Users folder.
• Extensions
  - At Ease Startup - provides the boot process and network code for At Ease. It prevents disabling At Ease (holding down the Shift key at start up).
  - Speech Manager - allows text-to-speech on the file names as the cursor passes over an icon. The default setting for this function is off.
• Applications
  - At Ease Setup - provides owners with the ability to customize At Ease folders for each user.
  - Mouse Practice - instructs a novice Macintosh user to navigate using a mouse to click and drag.
• Folders
  - At Ease Items - contains internal information, such as At Ease folders and the Preference file. If information is kept on an AppleShare server, this folder is created on the root of the server volume.
  - At Ease Movies - contains optional QuickTime movies for the At Ease buttons, and is in the At Ease Items folder. There's no provision for easily adding movies in this version of At Ease.
  - At Ease Receive - is in the At Ease Items folder, and may contain a temporary holding folder called At Ease Temp, used during remote administration.
  - At Ease Setups - is in the At Ease Items folder, and contains the Setups document and folders assigned to each setup.
  - At Ease Sounds - contains the sounds played when items are selected.
  - At Ease Users - is in the At Ease Items folder and contains At Ease folders.
  - Documents - located at the root of the At Ease Disk volume, it contains all the documents shown in the user's At Ease panels; kept in folders by user.
  - Mouse Practice - contains the Mouse Practice application (Macromind Player 3.0) and supporting movie and sound clips.

System Requirements

To run At Ease 2.0, you need a Macintosh computer with 2MB of RAM (4MB recommended), and a hard disk with at least 1.5MB of free disk space. You also must have system software version 7.0 or later installed.

At Ease and At Ease for Workgroups 1.0 and 2.0: Differences

Revised: 8/8/95
Security: Everyone

At Ease and At Ease for Workgroups 1.0 and 2.0: Differences

==========

Article Created: 2 August 1993
Article Reviewed/Updated: 08 August 1995

TOPIC ----------

This article outlines the differences between:

- At Ease 1.0 and 2.0
- At Ease for Workgroups 1.0 and 2.0
- At Ease 2.0 and At Ease 2.0 for Workgroups

DISCUSSION ----------

How At Ease 2.0 Differs from 1.0

At Ease 2.0 no longer saves memory over the Finder. In 1.0, it was reported that using At Ease would add another 100-200K of free memory for applications. Due to the increase of code size, this statement is no longer valid in 2.0. The memory footprint is about the same.

In 1.0, for each file a user saved, At Ease had an option to automatically create an alias (button) for the file. In 2.0, a button is only created if the user saves a document inside the user's documents folder. As this folder is the default location to save documents, this will be the standard case. However, if the user has the capability to move outside of the user's folder, the document may be "lost" and won't show up in the At Ease user's panel. The administrator can turn on the "Save documents only in user's panel" option to prevent the user from moving out of the user's folder.

When you start up your computer as a single user, you now see a splash screen that shows an administrator-defined greeting. However, a major feature of At Ease 2.0 is the ability to support multiple users, and in multi-user mode the login screen shows a list of names in a scroll box.

The new product now provides customers with the flexibility to share a single system with up to 10 named users, providing each user with customized

and private At Ease folders. The At Ease Setup control panel was removed and replaced by a standalone application called At Ease Setup. The setup application features enhanced file management, security and privacy capabilities, providing owners with the ability to customize At Ease folders for each user.

You can choose to see Minimal or All menu items, and with the Speech Manager installed, At Ease 2.0 can use text-to-speech to read the icon names as the pointer passes over them. You can also attach a sound to a button that will play when the cursor passes over the button.

At Ease 2.0 allows an owner of a single Macintosh system to specify whether users can open and save documents anywhere, only in the user's folder, only on a floppy disk, or start up directly in the Finder. Owners also can allow other At Ease users to have basic file management capabilities, such as the ability to create new folders, and delete, rename, and copy their own documents without going to the Finder.

How At Ease for Workgroups 2.0 Differs from 1.0

The features in At Ease 2.0 for Workgroups are designed specifically for administrators who manage multiple Macintosh systems in workgroup settings. Using a single setup program, administrators can specify a number of options for up to 1,000 users and 200 groups on each Macintosh system. This capability allows administrators to determine which applications and files are available to specific groups of users, while preserving customized individual user settings.

The setup program in At Ease 2.0 for Workgroups also gives administrators the ability to specify password requirements and provide users with simple file management capabilities, such as creating folders and renaming files. In addition, administrators can change and update At Ease settings on multiple Macintosh computers over an AppleTalk network, further increasing management flexibility. The networking features of At Ease 2.0 for Workgroups also allows administrators to establish servers for storage of users' documents or applications.

How At Ease 2.0 for Workgroups Differs from At Ease 2.0

At Ease for Workgroups has all the features described for At Ease 2.0, plus these additions and exceptions.

In At Ease 2.0 for Workgroups, there's an additional category for log in called At Ease Setup, to group users into common setup categories. And the setup for Menus allows much more customization than At Ease 2.0. It provides the ability to launch directly into the Finder and open Startup items, and there's a menu item to have users save documents on an AppleShare volume.

An administrator can arrange to have a set of Macintosh computers configured over a network. Logging the activity of users is also a feature of At Ease 2.0 for Workgroups that isn't available in At Ease 2.0.

You can lock the volume so that when a user boots from another disk, the At Ease disk won't mount. This prevents the unauthorized user from copying or changing the contents of the drive. The Workgroup Security Setup Screen also allows choices for the user to change password, log out idle user after a specified number of minutes, allow applications used from floppy disks, and allow remote administration.

At Ease 2.0 for Workgroups: Description (8/95)

==========

Article Created: 2 August 1993
Article Reviewed/Updated: 9 August 1995

TOPIC ----------

At Ease 2.0 for Workgroups manages shared Macintosh computers in multiuser environments.

DISCUSSION ----------

Features

The setup program allows the administrator to designate which applications and files are available to specific groups of users. You can also grant or deny permission for users to access folders, open documents, delete and copy files, make folders, and rename items. You can also change and update At Ease settings on multiple Macintosh computers over an AppleTalk network.

For security, you can assign each user an individual password to protect against unauthorized access to documents and applications. You can lock the At Ease disk to prevent users from starting up with a floppy disk, which would allow circumventing the program's other security features. And you can require users to save documents on floppy disks or AppleShare servers.

You can monitor user activity, checking who uses applications, how often, for how long, and more. This information allows decision-making about the use of a computer.

Users see large buttons that launch applications or open documents with one click. And users can access their applications and documents from any Macintosh on the network.

Components

At Ease 2.0 for Workgroups has all the components listed for At Ease 2.0 (except the At Ease Setup application). See the article "At Ease 2.0: Description" for

those components. In addition, At Ease 2.0 for Workgroups has the following components:

- Documents
  - At Ease Log is generated by the Setup application. The command is selected under the File menu. It lists logins, security risks, and applications used. It can print for all or selected users over a specified time. This file is normally invisible.
  - Setups stores setup configuration information.
- Applications
  - At Ease Setup for Workgroups allows an administrator to establish and configure At Ease setups and optionally manage setups over a network.
  - Unlock resets the administrator's password to null, and requires a password to use.

System Requirements

To run At Ease 2.0 for Workgroups, you need a Macintosh computer with 2MB of RAM (4MB recommended), a hard disk with at least 1.5MB of free disk space, and system software version 7.0 or later.

Modem Standard Terms Defined (8/95)

Revised: 8/10/95
Security: Everyone

Modem Standard Terms Defined (8/95)

==========

Article Created: 30 July 1993
Article Reviewed/Updated: 10 August 1995

TOPIC ----------

What do the terms MNP, V.xx and bis stand for? I know that there are several standards, but what do they mean? Which standards do the Apple Express Modem and 2400 internal modem have?

DISCUSSION ----------

For a complete discussion of the topic, an Introduction to Data Communications book will give more information. A book by Andrew S. Tanenbaum is a good one.

Terms Defined

V.xx is a standard created and maintained by CCITT which is an International standards body for networking communication. There are a number of V.xx standards and some correspond to older US standards. For example:

- V.21 same as Bell 103 (a 300 bps (bits per second) standard)
- V.22 same as Bell 212A (a 1200 bps standard)
- V.24 same as RS-232 (a 2400 bps standard)
- V.34 is the 28,800 bps standard

The term bis refers to the second release of a standard, or rev 2. For example:

- V.22 is a 1200 bps standard
- V.22bis is a 2400 bps standard
- V.32 is a 9600 bps standard
- V.32bis is a 14,400 bps standard

MNP stands for Microcom Networking Protocol and is used to define a number of levels of data compression and/or error correction standards for modems when they are communicating. The modems have to have compatible standards

(MNP level) to work properly together.

Standards for Apple Products

For the Express Modem the following are the features:

- Hayes standard AT command set support
- V.32 and V.32bis (that means transfer rates of: 7200, 9600, 12000, 14400)
- V.42 error control - Supports MNP 2-4 as well
- V.42bis data compression - Supports MNP 5 as well

For the Internal 2400 Modem:

- Supports the following standards:
  - Bell 103 -- 300 bps
  - V.21 -- 300 bps
  - Bell 212A -- 1200 bps
  - V.22 -- 1200 bps
  - v.22bis -- 2400 bps
- Error control -- MNP 3-4, same as V.42 for Bell 212A, V.22 and V.22bis only
- Data Compression -- MNP 5, same as V.42bis for Bell 212A, V.22 and V.22bis only

What about MNP 10?

This is an error correction standard designed for really noisy lines such as cellular connections. To use MNP 10 both modems must support MNP 10 and at this time there are few modems that do. No Apple modems support MNP 10 at this time.

Do Apple modems support 28.8?

At this time there are no Apple modems that support v.34 or 28.8 kbps connections. All Apple modems should be able to connect with v.34 modems at lower speeds.

What is V-Fast?

V-Fast is what 28.8 class modems were called before the v.34 standard was set. Modems that say V-Fast may not work will with true v.34 standard modems.

SCSI Termination and Quadra 800 Performance (7/93)

Revised: 8/10/93
Security: Everyone

SCSI Termination and Quadra 800 Performance (7/93)

==========

Article Created: 27 July 1993

TOPIC ----------

A Macintosh Quadra 800 with a single 500MB internal SCSI drive displays intermittent problems starting up and mounting.

DISCUSSION ----------

Two anomalies can affect Macintosh Quadra 800 models, as well as other models which use the 53C96 SCSI chip, if proper SCSI cabling and termination specifications are not followed.

The first anomaly involves which internal SCSI cable connector on the Quadra 800 is used to attach to the internally terminated hard drive. Some units may have the drive connected to the second SCSI connector (the connector below the CD). This leaves the remaining SCSI cable in an unterminated state. The proper configuration is for the internal SCSI drive to be connected to the last connector on the internal SCSI Bus. If the Quadra refuses to boot or has trouble mounting the internal hard drive when no external drive is connected, simply reconnecting the internal drive to the last SCSI connector may solve the problem. Remember to re-initialize the drive after reattaching the cable, as the boot disk's directory may be damaged.

The second anomaly is related to the SCSI specification of the external cables, as well as the termination state of the external devices. If the Quadra 800 has a variety of different external SCSI cables attached, the performance of devices on the SCSI bus may be erratic and unreliable. All Macintosh systems should use cables with properly matched impedance (90 - 130 ohm), shielding, all data lines twisted and paired with ground, and a properly terminated SCSI bus.

If the Quadra at one time had mismatched external SCSI cables attached, future system problems may occur due to damage to the boot disk directory code. The Quadra may appear to work fine for some time and then fail with the same symptoms. Even though the cables have been replaced, the disk directory could

still possibly be damaged. Once the drive directory is damaged, the failures could periodically appear even though the root cause of the problem (defective or mismatched cables) has been removed .

To make troubleshooting these problems confusing, every piece of equipment, including the cables and termination (both Apple and third-party), may work fine when tested individually. But once the products are combined into a system, the problems appear.

In these higher performance systems, with SCSI speeds reaching 5MB per second, the overall configuration is much less forgiving of any deviation from the designed impedance and termination requirements of Apple SCSI cables and the SCSI bus.

HP DeskWriter: Resolving Macintosh Print Problems (8/93)

Revised: 8/3/93
Security: Everyone

HP DeskWriter: Resolving Macintosh Print Problems (8/93)

==========

Article Created: 2 August 1993

TOPIC ----------

Here's some information to assist in the troubleshooting of printing problems for the Hewlett-Packard DeskWriter and DeskWriter C in serial or AppleTalk modes with any Macintosh computer.

DISCUSSION ----------

The DeskWriter operates in either AppleTalk or serial modes. When you power on the Macintosh, the DeskWriter senses line signals to determine which mode of operation to use.

Failure to Print in AppleTalk Mode

If the unit fails to print in AppleTalk mode, make sure the setup has LocalTalk connectors instead of an 8-pin DIN serial cable. It's important to have correct impedance matching for the DeskWriter. Check for AppleTalk active, and the selection of the DeskWriter(AT) in the Chooser. It's important to turn on the DeskWriter after powering on the Macintosh for proper mode sensing for AppleTalk mode.

Failure to Print in Serial Mode

If the unit fails to print in serial mode, make sure AppleTalk is inactive and the DeskWriter(serial) is selected in the Chooser. If the unit was just switched from an AppleTalk setup, then cycle power on the DeskWriter or DeskWriter C for proper mode sensing to convert to serial mode.

Kensington Turbo Mouse and PowerBook Duo Dock (8/93)

Revised: 7/8/94
Security: Everyone

Kensington Turbo Mouse and PowerBook Duo Dock (8/93)

==========

Article Created: 3 August 1993

TOPIC -----

Are Kensington trackballs compatible with the PowerBook Duo Docks? I am using an old Turbo Mouse, as well as a standard Apple mouse, with my Duo Dock. Sometimes the Turbo Mouse trackball does not work; sometimes the mouse does not work; sometimes neither of them work.

DISCUSSION -----

Kensington trackballs are compatible with the Macintosh PowerBook Duo computers.

The Turbo Mouse ADB 3.0, which was discontinued by Kensington last year, may have problems working with the PowerBook Duo and other new, fast Macintosh models. While most people can use it with the Duo, some have reported freezing and hesitant movement. Because of indiviual variations from unit to unit, replacing the trackball base ususally solves the problem.

The Kensington Turbo Mouse 4.0 is the currently shipping trackball model. There are no known problems using the Turbo Mouse 4.0 with the PowerBook Duo, Duo Dock, or any other model of Macintosh computer.

Kensington trackballs have a five year warranty. To locate a vendor's address and phone numbers, use the vendor name as a search string.

Floppy Disks: Unreadable or Won't Initialize (7/93)

Revised: 8/4/93
Security: Everyone

Floppy Disks: Unreadable or Won't Initialize (7/93)

==========

Article Created: 3 August 1993

TOPIC ----------

My 800K disk is suddenly, for no apparent reason, unreadable. I can't initialize any blank floppy disks, either. What's going on?

DISCUSSION ----------

You could have dirty heads in your drive. You can buy cleaning disks at most computer retailers. They look like ordinary disks, but they have a felt, moistened disk inside, instead of the plastic ones you normally use. You simply insert one of these cleaning disks and wait as long as the accompanying literature recommends.

You may also have a loose ribbon cable. If you have a modular, Macintosh II-series computer, turn the machine off, then take the cover off. Make sure the cable connecting the floppy disk drive to the main logic board is firmly seated. If you aren't comfortable doing this, or can't identify the ribbon cable, take your Macintosh to an Apple-authorized service center and have them check it for you. It shouldn't cost much, if anything, if a loose cable is the only problem.

PowerBook: Using a Modem with a Public Phone (7/93)

Revised: 8/4/93
Security: Everyone

PowerBook: Using a Modem with a Public Phone (7/93)

==========

Article Created: 3 August 1993

TOPIC --------------------

I want to have modem and fax capability from a public phone when I travel. I have a PowerBook 160 with an internal modem.

DISCUSSION --------------------

A few public telephones now have RJ11 jacks for connecting modems, but probably not enough to count on finding one when you need it. It may just be a matter of time before all public telephones are equipped with modem jacks to accommodate mobile computing.

Until then, determine if your modem can be configured to use an acoustic coupler. This device, the means by which all modems worked ten years ago, serves as a microphone and speaker for the handset.

PowerBook 100: Creating and Using a RAM Disk(7/93)

Revised: 7/7/94
Security: Everyone

PowerBook 100: Creating and Using a RAM Disk(7/93)

==========

Article Created: 3 August 1993

TOPIC ----------

How can I use a RAM disk to maximize the power of my PowerBook 100?

DISCUSSION ----------

The PowerBook 100 is uniquely suited to the use of a RAM disk, because it's the only PowerBook with batteries that supply power to RAM even when the computer is shut down. On all other PowerBooks, the RAM is erased upon shut down.

Since PowerBooks are set to turn off their hard drives after several minutes of inactivity, simple tasks like saving or opening new documents require that the hard disk spin up again. This takes time and battery power. However, you can allow the hard disk to spin down and stay there if you use a RAM disk.

However, RAM disks are only efficient if you have 6MB or more of memory on your hard disk.

An ideal RAM disk has a System Folder, applications, documents and anything else you'd store on any disk. But for safety, it's a good idea to back up the information on the RAM disk to your hard drive periodically.

You will find, while using a RAM disk, that your battery life improves significantly.

Creating a RAM Disk
---
1) Choose Control Panels from the Apple menu.

2) Open the Memory control panel.

3) Click the On button beneath the words "RAM disk."

4) Drag the slider to choose the percentage of available memory you want to

use for your RAM disk. The default size is 100 percent of available memory over 2 MB; that is, the largest RAM disk you can have. The size appears in the "RAM Disk Size" box.

5) Close the control panel.

6) Choose Restart from the Special menu. A RAM disk appears on the desktop.

Making a RAM Disk Your Startup Disk
---

1) Insert the Install 1 floppy disk that came with your PowerBook.

2) Open the Installer program.

3) Click the Switch Disk button until the RAM disk is displayed.

4) Click Customize.

5) Scroll through the list of items until you see "Min System for Macintosh PowerBook 100.

6) Click Install, and follow the instructions on the screen.

7) Click Quit.

8) Choose Control panels from the Apple menu.

9) Open the Startup Disk control panel.

10) Select the RAM disk as your Startup disk.

11) Choose Restart from the Special menu.

Make a backup copy of the disk a soon as you can, and back up its contents regularly to the hard drive.

Removing the RAM Disk

If you later decide to remove the RAM disk:

1) Throw its contents away and empty the trash.

2) Choose Control Panels from the Apple menu.

3) Choose the Memory control panel.

4) Move the slider in the memory control panel to 0 percent.

Express Fax Modem: Fax Icon Crossed Out (8/93)

Revised: 7/8/94
Security: Everyone

Express Fax Modem: Fax Icon Crossed Out (8/93)

==========

Article Created: 3 August 1993

TOPIC ----------

When I boot up on my PowerBook Duo, the Fax INIT for my Apple Express Fax Modem appears with an X through it. The modem INIT still works fine, but I can't send faxes.

DISCUSSION ----------

It sounds like an earlier system crash corrupted the Express Fax Preference file. You can fix it by throwing away the Fax Terminal Preference file in the System Preferences folder. You can restore it from the original software disks.

This problem was common to early versions of Apple Express Fax software, but has since been corrected in the 1.0.4 version.

Article Created: 3 August 1993
Article Reviewed/Updated: 01 November 1994

TOPIC --------------------

The Merry Christmas (merryxmas) virus is written in HyperTalk, the HyperCard scripting language. It can't affect any files other than HyperCard stacks and does not destroy or damage data. The most common indication of the merryxmas virus is that stacks launch and run much slower.

DISCUSSION --------------------

Many stacks can function properly when infected, but the Service Source won't function properly with this virus present. When the Service Source CD-ROM is built, every stack on the CD is checked for the virus, which is eliminated if found.

Basically, the virus traps these messages:

openbackground
closebackground
idle

Then it looks in the Home stack script for itself, and if it isn't there it copies itself. From the Home stack it checks the currently active stack for itself, and if it isn't there it copies itself.

You can obtain the merryxmas vaccine and documentation on AppleLink.

The first thing you need to do is read the information about the merryxmas vaccine. Follow the instructions to ensure you don't infect the stack!

Then run the Virus prevention installer. The documentation is built into the stack. This will install the built-in script to prevent infection.

Merryxmas Vaccine HyperCard Stack Requirements

This stack requires HyperCard v2.1. This is to handle System 7 aliases. System 7 isn't required. Color monitors will display "activity colors."

If you use a compression utility such as AutoDoubler, be sure to have adequate free space on the volume being checked. Stacks have a way of expanding as they are being examined.

What The Stack Will Do

This vaccine stack will quickly locate all the stacks on the volume of your choice; peek at the stack scripts (without opening the stacks); and replace the infected scripts without the virus code. A bonus feature is the option to let it compact those stacks that have free space available for compacting. Don’t worry about locked stacks —- this stack will unlock and relock them.

How to Use The Stack

1) Make a backup of all your stacks, if not your whole drive.
2) Click the Disinfect button.
3) Select the volume you wish to disinfect.

If you wish to test the stack first, use it to scan a floppy disk. It will scan locked volumes without making changes.

Script Segment That Will Prevent Infection

As an alternative to the vaccine stack, you can add the following script segment to the script of your Home stack and all your commonly used stacks. This should prevent the stacks from becoming infected. Copy it exactly as it appears below:

```
--this must be here to prevent the merryxmas virus from
--infecting this stack
--  on idle --merryxmas
--  on openbackground --merryxmas
--  on closebackground --merryxmas
```

Printing Grayscale: Requires at Least a 68020 Processor (7/93)

Revised: 8/4/93
Security: Everyone

Printing Grayscale: Requires at Least a 68020 Processor (7/93)

==========

Article Created: 3 August 1993

TOPIC --------------------

Can I print grays from a PowerBook 100 to a StyleWriter II? In the Print window, the Print Grays option is grayed out. That option is available on my Classic II, so why won't my PowerBook offer it?

DISCUSSION --------------------

The StyleWriter II requires Color QuickDraw, which needs at least a 68020 processor to run. Therefore, it is unavailable to the Macintosh Classic, Plus, SE and PowerBook 100s. On these systems, only black and white printing is possible. The Classic II, as you discovered, has a 68030 processor, so it can handle Color QuickDraw and grayscale printing.

Run Disk First Aid 7.1.1 or Later Before HD SC Setup (12/93)

Revised: 12/13/93
Security: Everyone

Run Disk First Aid 7.1.1 or Later Before HD SC Setup (12/93)

==========

Article Created: 4 August 1993
Article Reviewed/Updated: 10 December 1993

TOPIC ----------

I received the message "Unable to unmount drive, file may be in use." This happened when I tried to update the hard disk drivers with the new Apple HD SC Setup from the Hardware System Update 2.0 as explained in the ReadMe file. When I rebooted the Macintosh, the hard drive wouldn't mount, and it displayed a flashing question mark.

DISCUSSION ----------

Most likely, the system had already run into the problem resolved in the updated drivers. You must run Disk First Aid 7.1.1 or later to ensure that the problem isn't present on the disk prior to updating the drivers with HD SC Setup 7.2. If this order isn't followed, then updating the drivers will fail.

HD SC Setup version 7.2.2 fixes this problem.

Article Change History:
10 December 1993 - Added information about HD SC Setup version 7.2.2.
23 August 1993 - Revised to include Disk First Aid versions later than 7.1.1.

Disk First Aid 7.1.1 and HD SC Setup 7.2 (8/93)

Revised: 8/9/93
Security: Everyone

Disk First Aid 7.1.1 and HD SC Setup 7.2 (8/93)

==========

Article Created: 4 August 1993

TOPIC -----

What are the differences between Disk First Aid 7.1 and Disk First Aid 7.1.1 and Apple HD SC Setup 7.1 and Apple HD SC Setup 7.2? The Readme file advises to update the Disk Tools disks to these versions. It just says that the Apple HD SC Setup 7.2 allows greater flexibility in formatting large disks.

DISCUSSION -----

Disk First Aid (DFA) 7.1.1

DFA 7.1.1 has two changes from 7.1:

- To set the Volume OK bit when a volume passes all tests
- To change the default device that's checked by DFA to be other than the volume containing DFA.

The first of these helps resolve the Extents File problem found with 120MB drives. This was the case where a drive would fail to be mounted even though the drive was actually Okay. The computers that most commonly saw this problem were PowerBooks with 120MB drives.

The second of these was purely a convenience feature. If you run DFA from a floppy disk (this is the usual way), the default drive listed used to be the floppy disk which wasn't very useful. Now it will pick a hard drive in the SCSI chain.

HD SC Setup 7.2

HD SC Setup has two changes as well. Once again, the first has to do with the 120MB drive issue. If you update a drive's drivers with version 7.2, then you'll prevent this problem from occurring. Note that if your drive

has run into this problem, you first need to run Disk First Aid 7.1.1 to clear out the invalid bit.

The second change is simply larger volume support. Older versions of HD SC Setup didn't contain support for 1GB+ size drives.

A/UX: Visual Editor Set To TextEditor (8/93)

==========

Article Created: 3 August 1993

TOPIC -----

I'm using A/UX 3.0 and I'm having problems using the visual editor feature of mailx. In my .mailrc file, I have:

```
set VISUAL=/mac/bin/TextEditor
```

When creating a mail message, using mailx, I issue the "~v" command, and TextEditor comes up, showing a filename of /tmp/Re####, where #### is some random number. After typing some text, I save it, and then get the following error message: "Can't write onto file 'Re####' with an okay button." When I quit, I get a "save changes?" dialog, but I still get the same error. I have plenty of free disk space on "/" when this is occurring. Any suggestions as to what is going wrong?

DISCUSSION -----

We are able to reproduce this problem in A/UX 3.0, it's a TextEditor bug in A/UX 3.0. However, it worked under A/UX 3.0.1 and an Apple Workgroup Server (AWS) 95.

We suggest you upgrade to A/UX 3.0.1.

AudioVision Installer Disk: Software Components (8/93)

==========

Article Created: 3 August 1993

TOPIC --------------------

This article lists the software files found on the AudioVision Installer disk.

DISCUSSION --------------------

AudioVision Installer disk contents:

- AudioVision Installer Script
- AudioVision Read Me (contains compatibility notes, will go in root)
- Installer
- QuickTime (will go into Extensions folder, not installed under 7.1)
- Sound (will go into Extensions folder, into Control Panels under 7.1)
- Video (will go into Control Panels folder)
- ~AudioVision (will go into Extensions folder)

The tilde in ~AudioVision means that it will load after most other extensions for compatibility. The tilde shouldn't be removed.

AudioVision 14 Display: Compatibility (7/95)

==========

Article Created: 3 August 1993
Article Reviewed/Updated: 14 July 1995

TOPIC ----------

This article gives some compatibility information about the AudioVision 14 Display.

DISCUSSION ----------

The AudioVision 14 Display has been tested on the following Macintosh computers:

- Quadra 700, 900, 950, 800, 840AV
- Centris 610, 650, 660AV
- LC, LC II, LC III
- Performa models (NOTE: some of the audio/visual features of the monitor will only work with the AV computers.)
- II, IIx, IIcx, IIsi, IIci, IIfx, IIvx, IIvi
- PowerBook Duo 210, 230
- PowerBook 160, 165c, 180, 180c
- PowerBook 500 Series

The previous Apple Microphone does not work with the AudioVision Display. Be sure to use the PlainTalk Microphone.

Article Change History:
14 Jul 1995 - Added PowerBook 500 series
29 Nov 1993 - Added Performa to the list

LaserWriter Pro 630: Word Perfect & HP IIp Emulation (8/93)

Revised: 8/9/93
Security: Everyone

LaserWriter Pro 630: Word Perfect & HP IIp Emulation (8/93)

==========

Article Created: 6 August 1993

TOPIC --

I have a LaserWriter Pro 630 that is configured for Hewlett-Packard LaserJet IIp emulation. When I print WordPerfect's printer test, most of it prints properly, but the text is printed in the same size no matter whether Large, Bold, and Extra Large are selected.

Why?

DISCUSSION --

With the information we have, we believe that the problem lies in the HP PCL code (Printer Control Language used in Hewlett-Packard LaserJet IIP printers) produced by WordPerfect.

The "Large, Bold, and Extra Large" commands are not part of HP PCL, and are application-specific. To provide larger or "bolded" characters, there are corresponding HP PCL commands (escape codes) to change character height and stroke weight attributes. We suggest calling the application developers for further information.

You may also want to investigate how HP emulation is being invoked. In addition to enabling emulation via the printer thumbwheel switch, you can also invoke HP emulation via PostScript and thus a PostScript driver would be required. MS-DOS applications provide their own PostScript drivers. In the case of Windows applications, Microsoft ships various PostScript drivers with its Windows package.

LaserWriter Pro TraySwitching: LW Utility vs Print Dialog (7/93)

==========

Article Created: 5 August 1993

TOPIC ----------

What is the difference between turning on the LaserWriter Pro's TraySwitching feature through LaserWriter Utility 7.4.1 and the Options button in the actual Print dialog of LaserWriter driver version 8.0?

DISCUSSION ----------

Enabling this option through the Print dialog box will only affect the current job.

Enabling TraySwitching via the LaserWriter Utility will save the selection for all jobs and will retain the setting even when the printer is powered off.

Macintosh: No RTS Signal (8/93)

Revised: 8/9/93
Security: Everyone

Macintosh: No RTS Signal (8/93)

==========

Article Created: 6 August 1993

TOPIC -----

I'm having a serial communications problem with the Macintosh. I'm trying to access a Lecroy Digital oscilloscope over the RS-232-c line, and I need to know if there is a way to read a signal on the rts pin, similar to calling ibwait in gpib communication. I'm writing a program in Fortran on the Macintosh, and need to find an analogous command to the ibwait command, so that my program will wait until the signal comes and then transmit a command following the signal.

DISCUSSION -----

The Mac uses RS-422, rather than RS-232, for signaling. The RTS signal of the SCC in the Macintosh does not appear on the serial connectors. The DTR line does appear as HSKo (Pin 1) and can be set by calling the Serial driver with csCodes 16, 17 & 18 as described on page 226 in Inside Macintosh IV.

Another reference, which explains the connections of a Mac serial port somewhat, is the "Guide to the Macintosh Family Hardware" 2nd edition, published by Addison-Wesley. Chapter 10 is all about the serial ports on the Macintosh.

Electronic Devices: Use on Airplanes (8/93)

==========

Article Created: 9 August 1993

TOPIC ----------

I've heard that using a PowerBook on an airplane disrupts radio frequencies. Is that true?

DISCUSSION ----------

A number of pilots have reported that passenger use of portable electronic devices in some cases may have interfered with the aircraft's flight navigation or communications systems. In response, many airlines are restricting or managing the use of electronic equipment during flights.

The International Air Transport Association (IATA) recently recommended that its member airlines prohibit passengers from using electronic devices during takeoffs and landings.

It's probably best to check with your airline to find out specific rules for your flights.

Some of the pilot-reported incidents of interference have involved PowerBook computers, but it is unclear whether those computers indeed disrupted airplane communication or, if they did, how. Apple is aiding an investigation into these incidents to prevent them in the future.

Based on what is known now about the effects of electronics on airplane communications, the U.S. Federal Communications Commission (FCC) and the International Special Committee on Radio Interference have established very strict regulations for radio frequency emissions from personal computers. All Apple products are designed to conform to these standards.

The in-flight use of cellular phones, radios, and other devices with antennas that transmit or receive radio signals have been long prohibited because they could interfere with ground communications. But the effects of passive electromagnetic emissions from equipment such as laptop computers are not

clear.

PowerBook 100 and StyleWriter II: No Grayscale Support (8/93)

Revised: 7/7/94
Security: Everyone

PowerBook 100 and StyleWriter II: No Grayscale Support (8/93)

==========

Article Created: 9 August 1993

TOPIC ----------

I am trying to buy a StyleWriter printer and am considering which model to buy. The StyleWriter II supports GrayShare but I'm sure I read somewhere that the PowerBook 100 has Classic QuickDraw -- which means it doesn't support grayscale printing.

DISCUSSION ----------

This is true. To enable grayscale printing, you must have Color QuickDraw installed on your hard drive. Color QuickDraw requires at least a 68020 CPU, and a PowerBook 100 has only a 68000 CPU. Therefore, it can only support Classic QuickDraw.

Duo and PowerBook: Batteries Not Interchangeable (8/93)

==========

Article Created: 9 August 1993

TOPIC --------------------

Can I use the batteries from my Duo in my PowerBook? They seem to last longer than the ones in my PowerBook.

DISCUSSION --------------------

No. Members of the PowerBook line all have different batteries, and they are not meant to work across models.

Battery types for the PowerBook line:

PowerBook 100	lead-acid
other non-Duo PowerBooks	Nickel-Cadmium (NiCad)
PowerBook Duo	Nickel-Hydride (NiHy)

The Duo's batteries may last longer than batteries used in other PowerBooks if you properly maintain and recharge them. However, the two battery types are not interchangeable. In fact, the batteries for one model will not fit in the battery slots for another.

Fax/Modems: Disabling Call-Waiting (8/93)

==========

Article Created: 6 August 1993

TOPIC -----

I'm using an AppleFax modem on a Performa 405. I have call-waiting, and sometimes and incoming call interferes while I'm using my fax/modem, corrupting or blocking the message. Most of the time, I get an "RTF" message. What does that mean, and how can I get around this?

DISCUSSION -----

An RTF message indicates the fax modem is asking for retraining. That means the information was indeed corrupted by noise on the phone line.

In most cases, preceding the number you are dialing with *70 should do the trick.

If you are using a rotary dial modem, precede the number with 1170.

AWS 95: L2 Cache On The PDS Card (5/93)

==========

Article Created: 28 May 1993

TOPIC -----

What is the L2 cache on the Apple Workgroup Server (AWS) 95 PDS card?

DISCUSSION -----

This is high-speed static RAM which decreases access time for data from the disk. Read performance is significantly enhanced because the processor doesn't have to go all the ay to main memory for instructions or data that are in the cache. All cache management is done transparently in hardware so applications do not need to be re-written to be cache aware.

Duo: If Processor Cycling Slows Applications (8/93)

Revised: 7/8/94
Security: Everyone

Duo: If Processor Cycling Slows Applications (8/93)

==========

Article Created: 9 August 1993

TOPIC ----------

Why do some of my application run extremely slow on my Duo, but not on my desktop Macintosh?

DISCUSSION ----------

The Duo has several settings for battery conservation that ration power to different areas of the computer.

The Duo is set to reduce the power supply to the microprocessor when the computer is inactive for a few seconds. Most applications will not be affected significantly by this feature, but if you find certain applications perform unacceptably slowly, turn Processor Cycling off:

1) Choose Control Panels from the Apple menu.

2) Click the Options menu.

3) Click "Don't allow cycling."

Macintosh: System Error Type 15 (8/93)

==========

Article Created: 9 August 1993

TOPIC ----------

I keep getting the message "Sorry, an error of type 15 occurred" when my PowerBook 170 hard disk spins up while I'm on battery power.

DISCUSSION ----------

A Type 15 System Error is a segment loader error. The segment loader is a portion of the operating system that loads pieces of a program into memory. These pieces contain program instructions. Programs on the Macintosh can be split into many small pieces (with a usual maximum size of 32,768 bytes) so that not all the program is required to be in memory at once. The segment loader is used to load a piece of a program when it is needed. If it can't load that piece, then the program can no longer run, and a System Error 15 is reported.

Try reinstalling your system software from the disks that came with your computer, or a backup copy if you have one.

PowerBook 200 & 2300 Series: Memory Card Not Recognized (10/95)

Revised: 10/9/95
Security: Everyone

PowerBook 200 & 2300 Series: Memory Card Not Recognized (10/95)

==========

Article Created: 6 August 1993
Article Reviewed/Updated: 6 October 1995

TOPIC ----------

I bought the largest memory card available for my Macintosh PowerBook (Duo) computer, but my machine does not seem to be recognizing or accessing it. I tried it in my friend's PowerBook Duo computer and it worked fine. Does this mean there is a faulty card slot on my computer's logic board?

DISCUSSION ----------

All Macintosh PowerBook Duo computers have memory controllers on their logic boards designed to understand up to a certain maximum amount of RAM. Therefore, the amount of memory that your Duo can read depends on which model you have. The Maximum amount of RAM and the largest card that it can accept is shown in the following table.

Begin_Table

Macintosh PowerBook (Duo) Model	Maximum Amount of RAM	Largest Memory Module
PowerBook 210, 230, and 250	24 MB	20 MB
PowerBook 270c	32 MB	28 MB
PowerBook 280 and 280c	40 MB	36 MB
PowerBook 2300c*	56 MB	48 MB

*Note: All of the models have 4 mb on the motherboard except the 2300c which has 8 mb on the motherboard.

End_Table

One other possible reason that your RAM card works in your friend's PowerBook computer but not yours is probably due to the range of RAM tolerance specifications allowable for Apple Macintosh computers. Because the tolerance is defined within a range it can vary from unit to unit. The third-party companies

that manufacture memory cards for Apple's Macintosh computers may design them at the very limits (high or low) of the PowerBook computer's tolerance. Apple makes no guarantee that third-party products will work with Apple products.

To test whether or not your machine falls within the Apple-specified tolerance parameters you (or an authorized Apple Service technician) should see how it performs with the Apple 4 MB or 8 MB card. If that functions properly in your computer, there is nothing wrong with your PowerBook computer, but the RAM card may not have been manufactured within the computer's tolerances. If this is the case, you will need to contact the manufacturer of the card for more information.

PowerBook: Disabling Processor Cycling/System Rest (5/96)

Revised: 5/8/96
Security: Everyone

PowerBook: Disabling Processor Cycling/System Rest (5/96)

==========

Article Created: 9 August 1993
Article Reviewed/Updated: 8 May 1996

TOPIC ----------

Every once in a while my PowerBook computer slows down for no apparent reason. I tried to determine if there was a pattern, but it seems to happen in just about any application.

DISCUSSION ----------

The pattern you might have noticed is that the slow down occurs after you have left your PowerBook computer inactive for a certain period of time. The PowerBook drops the power consumption of its microprocessor to save battery power during periods of inactivity.

Inactivity is defined by the PowerBook as no user interaction, and no interaction with a peripheral device, such as a modem or disk drive.

If your PowerBook is running System 7.0.1 (which came installed on the PowerBook 100, 140, and 170), this feature is known as "system rest". If your PowerBook is running System 7.1 or later (which came installed on all other PowerBook computers to date), this feature is known as "processor cycling".

You can disable system rest or processor cycling if it becomes an annoyance. However you should keep in mind that your battery life will not be as good, especially if you often must divert your attention away from your PowerBook during use.

Portable Control Panel
==========

To disable system rest (on PowerBook computers that have the Portable control panel):

Step 1

Choose Control Panels from the Apple menu, and open the Portable control panel.

Step 2

Hold down the Option key and click on the words "Minutes Until Automatic Sleep."

Step 3

In the window that appears, click Don't Rest.

Step 4

Click OK to disable Rest Mode, or click Cancel.

PowerBook Control Panel
=======================

To disable processor cycling (on PowerBook computers running System 7.1, which use the PowerBook control panel):

Step 1

Choose Control Panels from the Apple menu, and open the PowerBook control panel.

Step 2

Hold down the Option key on the keyboard and click the Options button.

Step 3

Under Processor Cycling in the next window, click "Don't allow cycling".

Step 4

Click OK for your new settings to take effect, click Cancel to leave the settings as they were before, or click Use Defaults to return to the original settings.

PowerBook Control Panel
=======================

(PowerBook 500 series and System 7.5.x)
To disable processor cycling (on PowerBook computers running System 7.1.x, 7.5.x or later, which use the PowerBook control panel):

Step 1

Select Control Panels from the Apple menu, and open the PowerBook control panel.

Step 2

Slide the select switch to "Easy".

Step 3

While holding the option key down select "Custom". A new choice, named Options, will appear.

Step 4

Put an "X" in the box to turn off processor cycling.

PowerBook: If You Have Trouble Re-establishing AppleTalk 8/93

Revised: 7/7/94
Security: Everyone

PowerBook: If You Have Trouble Re-establishing AppleTalk 8/93

==========

Article Created: 5 August 1993

TOPIC --------------------

My PowerBook is generally hooked to the AppleTalk network in my office, However, after I took my PowerBook on a trip I tried to reconnect to the network, I couldn't use the network services. What happened?

DISCUSSION --------------------

AppleTalk employs something called node-addressing. Each AppleTalk device will choose a network node number on start-up when first connected to the network. When the computer is turned off, then on again, it automatically chooses the same node number.

When you took the PowerBook off the network, you made the node number it had been using available to other devices on the network. Chances are, another device chose that number while you were away.

Normally, if a device returns to the network to find its node number taken, it chooses a new one. However, a PowerBook connected to a network while it is in Sleep mode will try to use its old node number, even if it has been reassigned.

To resolve your problem, you may do one of two things:

- Connect the sleeping PowerBook to the network and restart; or
- Wake the PowerBook, open the Chooser in the Apple menu and turn off AppleTalk, connect to the network, and turn AppleTalk back on.

PowerBook: Clicking Sound on Startup (9/94)

Revised: 9/26/94
Security: Everyone

PowerBook: Clicking Sound on Startup (9/94)

==========

Article Created: 9 August 1993
Article Reviewed/Updated: 26 September 1994

TOPIC ----------

I keep hearing an unnerving clicking or popping sound around the same time as the chime when I turn on my PowerBook. Sometimes it happens while I'm working in an application, too.

DISCUSSION ----------

Actually, nothing is wrong. The PowerBook comes equipped with power-management circuitry that automatically cuts power to features that are not in use.

This circuitry controls the sound feature, among others. Thirty seconds after the PowerBook last played a sound, power is cut to the sound chip. Each time it must be accessed anew (for instance, when you power up) the power has to be revived, which creates that clicking noise.

A freeware extension called Shhh! was written to force the PowerBook to maintain power to the sound circuitry thus preventing the clicking noise. Shhh! is freeware and is not supported by Apple.

AWS 95: Maximum Number of Macintosh Volumes (5/93)

Revised: 8/9/93
Security: Everyone

AWS 95: Maximum Number of Macintosh Volumes (5/93)

==========

Article Created: 28 May 1993

TOPIC ----------

What is the maximum number of Macintosh volumes that can be attached to an Apple Workgroup Server (AWS) 95?

DISCUSSION ----------

The Macintosh OS sees all four SCSI buses as one; this makes it unable to distinguish SCSI devices with the same id, but on different SCSI buses. Each HFS volume must have a unique SCSI id between 0 and 6, for a maximum of 7 HFS volumes.

Copyright 1993, Apple Computer, Inc.

AWS 95: Maximum Number of SCSI Devices (5/93)

==========

Article Created: 28 May 1993

TOPIC ----------

What is the maximum number of SCSI devices that can be attached to the Apple Workgroup Server (AWS) 95?

DISCUSSION ----------

The total AWS 95 system has four separate SCSI busses, two on the main logic board and two on the PDS SCSI accelerator card. Because each bus can support 7 devices the theoretical limit on SCSI devices is 28. However there is only enough space and connectors for 20 devices.

AWS 95: Numbering For Multiple SCSI Buses (5/93)

Revised: 8/9/93
Security: Everyone

AWS 95: Numbering For Multiple SCSI Buses (5/93)

==========

Article Created: 28 May 1993

TOPIC ----------

How does the numbering for the multiple SCSI busses work on the Apple Workgroup Server (AWS) 95?

DISCUSSION ----------

The AWS 95, with the PDS accelerator card installed, has 4 SCSI busses available for general use. They are numbered in the order they are searched in the Mac environment:

1 - main logic board internal
2 - main logic board external
3 - accelerator card internal
4 - accelerator card external

The PDS card has an additional internal SCSI connector so that it is possible to connect disk mirroring or RAID devices in parallel.

With this bus numbering scheme, the slice 0 of the drive attached to the internal PDS card connector and set to SCSI id 0 is referred to as:

/dev/dsk/c300d0s0

AWS 95: SCSI Devices Referenced Under A/UX 3.0.1 (5/93)

Revised: 8/9/93
Security: Everyone

AWS 95: SCSI Devices Referenced Under A/UX 3.0.1 (5/93)

==========

Article Created: 28 May 1993

TOPIC ----------

How are SCSI devices referred to under A/UX 3.0.1?

DISCUSSION ----------

The A/UX 3.0.1 SCSI disk driver has been modified to allow selection among the four SCSI busses available on the AWS 95 platform. Referring to disk drives is different on the AWS 95 than under traditional A/UX. Each disk must be identified not only by its SCSI address, but also by the SCSI bus that it is attached to.

The SCSI busses are numbered 1 through 4 (see the accelerator card section of this document). In previous versions of A/UX a SCSI drive with address 5, drive 0, slice O would be specified through the device file /dev/dsk/c5dOsO. Now you must also specify the bus number.

The new format is /dev/[r]dsk/cbOad#s#, where b is the SCSI bus (numbered from 1 to 4) and a is the SCSI address (numbered from O to 6). The SCSI busses are numbered in the order they are searched in the Mac environment: main logic board internal, main logic board external, PDS card internal, and PDS card external. The busses are numbered from 1 to 4 instead of from O to 3 to avoid the problem of forcing leading zeros when generating device file names.

The old format, /dev/[r]ds/c#d#s#, where c# is the SCSI address, d# is the logical unit number, and s# is the slice number will continue to work. The c# field will specify both the SCSI bus and the SCSI address of the device. The current device files(/dev/dsk/c[O-6]d#s#)will refer to the device that is visible to the Macintosh OS regardless of what SCSI bus the drive resides on. This is for backwards compatibility.

For example, these path names map in the following way:

Pathname	SCSI ID	SCSI Bus
/dev/dsk/c203dOsO	3	Mother Board External
/dev/dsk/c403dOsO	3	PDS Card External
/dev/dsk/c3dOsO	3	Wherever it is found first

AppleTalk v58.02: Conflicts with Shiva Products (8/93)

Revised: 8/10/93
Security: Everyone

AppleTalk v58.02: Conflicts with Shiva Products (8/93)

==========

Article Created: 9 August 1993

TOPIC --

I'm having problems using a Shiva EtherGate after I installed AppleTalk v58.02 from the NSI 1.3.3. It can now take five minutes for the Network Control Panel to open when selecting the Shiva driver. When I ran the standard System 7.1 Network C-Dev it opened fine. I'm using 58.02 for Shiva's Ethernet box to work. What could possibly be causing this?

DISCUSSION --

We checked with Shiva Tech Support who confirmed that Shiva EtherGate (and NetModem), produce the symptoms you describe above when used with any Macintosh running AppleTalk v58.02. When you loggon with the EtherGate they are hearing complaints that it may take 5 or more minutes to make the connection, (and 2 or more minutes when using the NetModem), during which time it appears that the Macintosh has hung. Once the connection is made everything else works fine at expected performance levels. Nevertheless, they recommend dropping back to an earlier version of AppleTalk prior to v58.02, such as v58, to avoid these long loggon times, until they are able to revise their drivers. The current version of the EtherGate software is 1.6.1, and is posted on AppleLink in the third party bulletin board.

Express Modem and Cellular Phone With No Dial Tone CCL (8/93)

Revised: 8/10/93
Security: Everyone

Express Modem and Cellular Phone With No Dial Tone CCL (8/93)

==========

Article Created: 9 August 1993

TOPIC -----

I can't dial out with a cellular phone with my Express Modem in a PowerBook Duo. I have the appropriate hardware needed with a data jack, but I need help rewriting the CCL to work with no dial tone (NDT). What do I need to do?

DISCUSSION -----

In order to disable dial tone detection use the Xn command in the dialing command. For example ATX3DT 18005551212. X0, X1, and X3 are the commands to use for blind dialing (no dial tone needed). The difference in the three commands is the result codes that they enable. The description of the result codes and the Xn command is documented in the Express Modem AT Commands file that comes with the Express Modem Software.

Language Kits: Express Modem & WorldScript Compatibility (7/95)

Revised: 7/6/95
Security: Everyone

Language Kits: Express Modem & WorldScript Compatibility (7/95)

==========

Article Created: 10 August 1993
Article Updated/Reviewed: 6 July 1995

TOPIC ----------

One of the Language Kits is installed on my computer. I tried to Fax a document using Apple's PowerBook Express Modem and Fax Sender 1.5.x. I had the following problems:

Fax Phone Book Window Will Not Scroll

In the Fax Send "Fax Phone Book" window, the window refuses to scroll, despite the fact that the scroll bar is dark (the scroll bar box can be moved with the mouse but the contents of the window won't scroll). However, the arrow keys on the keyboard still function correctly.

Fax Does Not Include Cover Page

The cover page does not transmit even though it is selected in the Fax Sender dialog box.

DISCUSSION ----------

These issues have been resolved with GeoPort 2.1. Users should upgrade to Apple Telecom 2.1 or later software.

If you are using earlier version of software, there is a conflict between the Express Modem software, Fax Sender, and the WorldScript II extension which comes with the Language Kits.

The problem disappears when the WorldScript II extension is removed from the System Folder and the computer is restarted. The Fax Phone Book window then scrolls correctly, and a cover sheet is Faxed. However all Japanese or Chinese characters in the document are unintelligible.

Apple has been able to reproduce this problem. The scroll bar is active, but

does not do anything. This is true of the scroll bars for both the "Fax Phone Book" and "Send To" lists.

Workarounds

Until this conflict is resolved in future versions of the software, try these workarounds:

Scrolling Problem

Use the arrow keys on the keyboard to scroll through the windows.

Cover Page Problem

Embed a cover sheet within the Fax document. In other words, do not use the Fax Cover application to create a cover sheet, but instead, add the information you want to be on the cover page as Page 1 of the document you are sending as a fax.

Article Change History:
06 Jul 1995 - Added GeoPort 2.1 fixes these issues.
22 Feb 1995 - Changed article to include all Language Kits.
28 Mar 1994 - Included cover page issue and Express Modem.

Macintosh Standard DAs: Documented in Balloon Help (8/93)

Revised: 8/16/93
Security: Everyone

Macintosh Standard DAs: Documented in Balloon Help (8/93)

==========

Article Created: 12 August 1993

TOPIC --------------------

Some recent Macintosh manuals don't describe how to use the standard desk accessories (DAs), the small programs that appear under the Apple menu and are included with every Macintosh system. In some cases, the Scrapbook DA contains the text "See your owner's guide for more information" but the owner's guide doesn't have more information about the Scrapbook.

DISCUSSION --------------------

There are several versions of the Macintosh User's Guide, and they differ in the information they provide about desk accessories. If this information is missing from your manual, simply turn on Balloon Help. (This applies to Macintosh systems with System software version 7.0 or later.)

1) Choose "Show Balloons" from the "?" menu.

2) Choose a desk accessory from the Apple menu.

3) As you move the mouse pointer around the DA, help balloons will describe the DA's functions.

4) To turn off Balloon Help, choose "Hide Balloons" from the "?" menu.

PowerBook 145B: Incorrect About This Macintosh... Info (8/93)

Revised: 7/7/94
Security: Everyone

PowerBook 145B: Incorrect "About This Macintosh..." Info (8/93)

==========

Article Created: 12 August 1993

TOPIC -----

When I choose "About This Macintosh..." from the Finder's Apple menu, my PowerBook 145B reports itself as follows:

System 7.0.1: "PowerBook 140"
System 7.1: "PowerBook 145"

DISCUSSION -----

What you've discovered with your PowerBook 145B is normal.

Why System 7.1 Reports PowerBook 145

The PowerBook 145 and 145B have almost identical hardware, the only difference being the amount of RAM soldered to the logic board. According to APDA's Developer Notes, the PowerBook 145B returns the same gestaltMachineType value as the PowerBook 145 when it is queried by software. Thus, there is no way for software to differentiate between the two models.

Why System 7.0.1 Reports PowerBook 140

System 7.0.1 was released before the PowerBook 145 and 145B were introduced. It doesn't have the information with which to identify these models correctly, and calls them PowerBook 140 instead.

PowerBook 165: Description (8/93)

Revised: 7/8/94
Security: Everyone

PowerBook 165: Description (8/93)

==========

Article Created: 16 August 1993

TOPIC ----------

This article describes the PowerBook 165.

DISCUSSION ----------

The Apple PowerBook 165 is an all-in-one notebook computer. Featuring a 33 megahertz 68030 microprocessor, the PowerBook 165 supports up to 14 megabytes of RAM, so you can work with multiple applications simultaneously.

The PowerBook 165's 10-inch (254-millimeter) backlit passive-matrix display supports 16 levels of gray. You can connect the PowerBook 165 to any Apple color display (up to 16-inch) or some VGA/SVGA displays. In dual-display mode, you can display one image on the built-in screen and a different image or even another application on an external monitor at the same time.

The PowerBook 165 includes a standard-size keyboard, full-page-width display, built-in trackball, and seven built-in ports for access to peripheral devices. It fits in a briefcase and weighs just 6.8 pounds (3.03 kilograms).

AppleTalk networking is built into the PowerBook 165, so you can connect to an AppleTalk net-work, such as electronic mail, printers, and file servers. With an optional modem and AppleTalk Remote Access software, the PowerBook 165 can access AppleTalk networks practically anywhere in the world.

PowerBook 165 Features

Power and speed

• 33-MHz 68030 microprocessor

Memory

• 4 MB of RAM, expandable to 14 MB

Display

• Supertwist backlit passive matrix, 640 by 400 pixels
• Full-page-width, 10-in. (254 mm) diagonal; 16-level gray scale
• Adjustable brightness and contrast controls

Expansion

• Seven built-in ports for peripheral devices, including a video-out port for an external color display
• Slots for internal modem and RAM

System software

• System software version 7, with multitasking, file sharing, Balloon Help, TrueType fonts, and more

Networking

• Built-in AppleTalk networking
• File sharing without a dedicated server

Compatibility

• Reads and writes Macintosh, MS-DOS, OS/2, and ProDOS floppy disk formats

Ordering Information

PowerBook 165 4/80
Order No. M1641LL/A

PowerBook 165: Expansion Board Differences (3/95)

Revised: 3/31/95
Security: Everyone

PowerBook 165: Expansion Board Differences (3/95)

==========

Article Created: 16 August 1993
Article Reviewed/Updated: 31 March 1995

TOPIC ----------

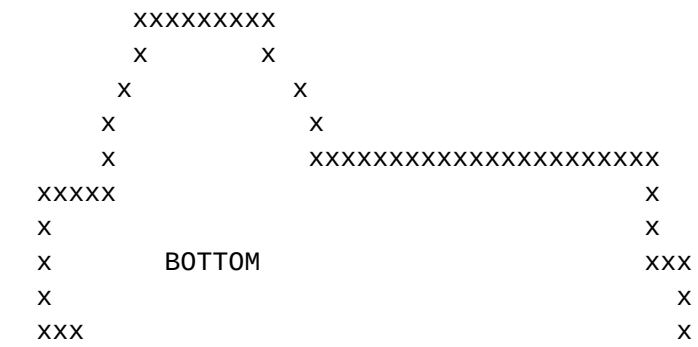
How can I distinguish between a PowerBook 160 and PowerBook 165 expansion board?

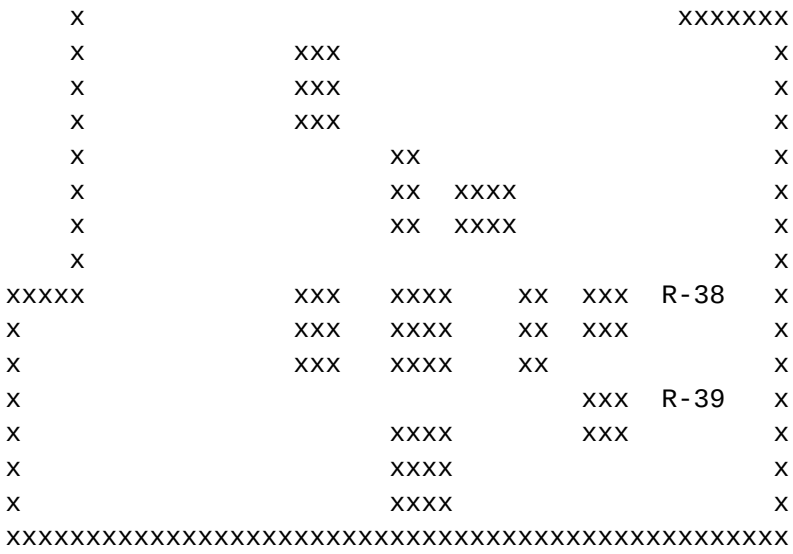
DISCUSSION ----------

You can distinguish between or identify the PowerBook 160 and 165 expansion boards by checking the R38 and R39 resistors, and the speed of the crystal. Here is a simple guide along with a drawing of the expansion board to show the placement of the resistors:

PowerBook 160 expansion board
- R38 resistor in place
- R39 resistor not in place
- 25 MHz oscillator

PowerBook 165 expansion board
- R38 resistor not in place
- R39 resistor in place
- 30 MHz oscillator





PowerBook 160/165 expansion board

PowerBook 165: Technical Specifications (3/95)

==========

Article Created: 16 August 1993
Article Reviewed/Updated: 22 March 1995

TOPIC ----------

This article provides the technical specifications for the PowerBook 165 computer.

DISCUSSION ----------

Microprocessor

- Motorola 68030, running at 33 MHz

Memory

- Comes with 4 MB of pseudostatic RAM (PSRAM)
- Expands to 14 MB of RAM with the addition of third-party PSRAM cards

Disk storage

- One built-in 1.4-MB Apple SuperDrive disk drive that uses high-density floppy disks and reads, writes, and formats Macintosh, MS-DOS, OS/2, and ProDOS disks
- One internal 80 or 160 MB hard disk

Display

- 10-in. (254-mm) diagonal
- Backlit supertwist passive-matrix display, 640 by 400 pixels
- 16 shades of gray
- Two video-out modes:
  - Video mirroring for simultaneous display of the same image on two screens
  - Dual display for full use of both screens with different images or different applications at the same time

- Built-in support for up to 256 colors on a variety of external displays
- External display options
  - Macintosh 12-inch Monochrome Display
  - Macintosh 12-inch RGB Display
  - AppleColor High-Resolution RGB Display
  - Macintosh Color Display (14 in.)
  - Macintosh 16-inch Color Display
  - Macintosh Portrait Display (15 in.)
  - Some VGA and SVGA monitors

Battery

- Nickel-cadmium which provides 2.5 to 3 hours of computer use before recharging is necessary.

Keyboard

- Built-in keyboard with standard Macintosh layout
- Two-level tilt adjustment

Trackball

- 30-mm (approx. 1.25-in.) diameter, two buttons

Clock/calendar

- CMOS custom-integrated circuit with long-life lithium battery

Microphone

- Built-in omnidirectional; output voltage of 4 mV, peak-to-peak, at normal volume

Interfaces

- One power adapter port
- One Apple Desktop Bus (ADB) port for keyboard, mouse, and other input devices
- Two RS-422 serial ports for LocalTalk networking, printers, modems, and other devices
- One HDI-30 SCSI port for hard disks, scanners, CD-ROM drives, and other devices
- One slot for optional modem
- One video-out port that supports 8-bit density and 256 colors
- One sound-out port for external audio amplifier or headphones
- One sound-in port
- Security slot for use with third-party equipment to lock the computer

Modem

- Optional internal PowerBook Express Modem; sends and receives data at 14,400 bps and sends and receives faxes at 9600 bps. Includes Express Fax software.

• Optional internal 2400-bps modem; sends faxes at 9600 bps.
  Includes fax-send software.

Sound generator

• Apple Sound Chip provides 8-bit sound and is capable of driving stereo headphones or other stereo equipment. These devices connect to the Apple Sound Chip through the sound port.

Sound input

• 8-bit sound, sampled at 11 or 22 kHz

Disability access

• CloseView, Easy Access, and visible-beep software are included with system software. These built-in third-party options provide alternative means of input and output for people with disabilities.

ADB power requirements

• Maximum current draw for all ADB devices is 200 mA (milliamps). A maximum of three ADB devices is recommended.

Power requirements

• Line voltage: 110 to 220 V
• Frequency: 50 to 60 Hz

Environmental requirements

• Operating temperature: 50 F to 104 F (10 C to 40 C)
• Storage temperature: -40 F to +149 F (-40 C to +65 C)
• Relative humidity: 20% to 80% noncondensing
• Operating altitude: 0 to 10,000 ft. (0 to 3048 m)
• Maximum storage altitude: 15,000 ft. (4722 m)

Size and weight

• Height: 2.25 in. (5.7 cm)
• Width: 11.25 in. (28.6 cm)
• Depth: 9.3 in. (23.6 cm)
• Weight: 6.8 lb. (3.03 kg)

Article Change History

Centris 660AV & Quadra 840AV: Speech Recognition Settings (8/93)

Revised: 8/19/93
Security: Everyone

Centris 660AV & Quadra 840AV: Speech Recognition Settings (8/93)

==========

Article Created: 10 August 1993
Article Reviewed/Updated: 19 August 1993

TOPIC ----------

What settings must I check to enable speech recognition on the Macintosh Centris 660AV and Quadra 840AV?

DISCUSSION ----------

For speech recognition to work, the Sound control panel settings must be:

• Sample rate: 24.000 kHz (This is the preset rate)

To set the sample rate:
1) Open the Sound control panel
2) Choose Sound Out from the pop-up menu
3) Choose 24.000 kHz from the Rate pop-up menu

• Input Source: Microphone (This is the default setting.)

1) Open the Sound control panel.
2) Choose Sound In from the pop-up menu.
3) Click on the Options button.
4) Click the radio button marked Microphone.
5) Click the OK button to return to the Sound control panel.

• Playthrough: off (This is the default setting.)

1) Open the Sound control panel.
2) Choose Sound In from the pop-up menu.
3) Click on the Options button.
4) Make sure the checkbox marked Playthrough is unchecked.
5) Click the OK button to return to the Sound control panel.

Security: Everyone

Centris 660AV & Quadra 840AV: Speech Recog & GeoPort Use (8/93)

==========

Article created: 10 August 1993

TOPIC -----

Can I use speech recognition while I'm using the GeoPort Telecom Adapter on the Macintosh Centris 660AV and Quadra 840AV??

DISCUSSION -----

When speech recognition is turned on, your Centris 660AV or Quadra 840AV may not be able to establish a modem connection using the GeoPort Telecom Adapter.

This may occur when the DSP (Digital Signal Processor) is attempting to perform the demanding work of both speech recognition and establishing a modem connection.

If this problem occurs, turn off speech recognition in the Speech control panel and attempt the modem connection again.

Centris 660AV & Quadra 840AV: Sound Sample Rates (8/93)

Revised: 8/10/93
Security: Everyone

Centris 660AV & Quadra 840AV: Sound Sample Rates (8/93)

==========

Article created: 10 August 1993

TOPIC ----------

What are the sound sample rates on the Macintosh Centris 660AV
and Quadra 840AV??

DISCUSSION ----------

The preset sound sample rate for your computer is 24 kilohertz (kHz).
This sample rate is required for speech recognition and for
telecommunications.

If you are not using either speech or telecommunications, you can change the
sound sample rate (in the Sound Out section of the Sound control panel) to
22.05 kHz, 44.1 kHz, or 48 kHz.

These three sample rates generally offer better sound quality if the sound
source is a compact disc (CD) or digital audio tape (DAT). (If you use speech
and telecommunications capabilities frequently, it's probably a good idea to
keep the sample rate set at 24 kHz.)

Centris 660AV & Quadra 840AV: S-video ports (8/93)

Revised: 8/10/93
Security: Everyone

Centris 660AV & Quadra 840AV: S-video ports (8/93)

==========

Article created: 10 August 1993

TOPIC --

This article provides details on the Macintosh Centris 660AV
and Quadra 840AV S-video ports.

DISCUSSION ---

Connecting Cables to the S-video ports

Take care to connect only S-video cables to the S-video port:
Your computer will not start up if the cable for a serial device,
such as a printer or modem, or an Apple Desktop Bus (ADB) cable is
plugged into the either of the S-video ports.

Power Requirements

Devices connected to the Camera/S-video input port use power as follows:

Camera/S-video device	+12 volts	500 milliamperes	6 watts

This updated information supersedes the requirements for the S-video input
port in the Technical Information manual which comes with the Centris 600AV
and Quadra 840AV computers.

Macintosh AV Series: Recording To Videotape (12/93)

==========

Article Created: 10 August 1993
Article Reviewed/Updated: 23 December 1993

TOPIC ----------

Can I record computer images and sounds on videotape with the Macintosh Centris 660AV, Quadra 660AV and Quadra 840AV??

DISCUSSION ----------

To record the computer's images and sounds on videotape, you must use a television as the monitor. Follow these steps to record on videotape:

1) Connect a videocassette recorder (VCR) to the computer's video output port (either composite or S-video, depending on the VCR you have) and sound output port.
2) Connect a television to the VCR's video out port and sound out port(s).
3) Switch to the television as monitor, using the Monitors control panel (See separate instructions below).
4) Begin recording by pressing the Record button on the VCR.

To switch to the television as monitor, follow the steps below:

1) Make sure that a television is connected to the composite video output port and is turned on.
2) Open the Monitors control panel.
3) Click the Options button. The Options dialog box appears.
4) In the Select Monitor Type section of the dialog box, choose one of the resolution types listed:

   - For USA and Japan, choose 512x384 Resolution (NTSC standard)
   - For Europe and Australia, choose 640x480 Resolution (PAL standard)

5) Click OK. The Options dialog box closes.
6) Choose Restart from the Special menu in the Finder.
7) Once the computer has restarted, open the Monitors control panel.

8) Click the Options button. The Options dialog box appears.
9) In the Video Display Options section, click the button labeled Display Video on Television.
10) Click either the NTSC Standard (USA and Japan) or the PAL Standard (Europe and Australia) button
11) Click the Use Flicker-free format checkbox.
12) Click the OK button. A dialog box appears, asking you to confirm your changes.
13) Click the Switch button to change from the monitor to the television.

The computer's image is displayed on the television.

Article Change History:
23 December 1993 - added info for all AV models.
23 August 1993 - added correct name of Quadra 840AV to title.

Quadra 660AV & 840AV: Floppy Drive Rejects 800K Disks (2/95)

Revised: 2/7/95
Security: Everyone

Quadra 660AV & 840AV: Floppy Drive Rejects 800K Disks (2/95)

==========

Article Created: 10 August 1993
Article Reviewed/Updated: 7 February 1995

TOPIC

The floppy disk drive on the Macintosh Centris/Quadra 660AV and Quadra 840AV may occasionally reject some of your 800K floppy disks.

DISCUSSION

Both the Macintosh Centris 660AV and Quadra 840AV use a new floppy disk controller that reads and writes data more precisely than the one used in most other Macintosh computers. For this reason, the computer may not be able to read some 800K floppy disks that were created by mass-duplication equipment, or other non-AV Macintosh computers. If you experience this problem, check with the software vendor for another copy of the disk.

Some versions of copy protection for 800K floppy disks are not compatible with your computer. If you have a problem with a copy-protected disk, check with the software vendor for an upgraded or unprotected copy of the disk.

ProDOS 800K Disks Created on an AV Series Macintosh

This problem can also appear when formatting a disk on an AV series Macintosh as a ProDOS 800K disk, inserting it into an Apple IIgs, saving an AppleWorks file onto it, and re-inserting it into the AV Macintosh. This often results in the AV Macintosh reporting that disk was unreadable.

Troubleshooting and Workarounds

Zap the parameter RAM

Restart your Macintosh, holding down the Command-Option-P-R keys. The smiling Macintosh icon appears and shortly after, the computer restarts once again. Release the keys and insert your 800K floppy disk once the Finder appears.

Restart your Macintosh with extensions off

Restart your Macintosh and hold down the Shift until the Welcome to Macintosh dialog box appears with the additional message Extensions Off. Release the Shift key and insert your 800K floppy disk once the Finder appears.

Turn off Speech Recognition

Open the Speech Setup control panel and click the OFF button. Restart your Macintosh and insert your 800K floppy disk once the Finder appears.

Make sure you do not have composite SIMMs (RAM) installed

Apple does not recommend using composite SIMMs for RAM expansion in any Macintosh computer. For further information, search by COMPOSITE in the Technical Information Library.

Regenerate Macintosh-generated disks on another Macintosh

If Macintosh-generated 800K disks are unreadable on your Macintosh AV, copy the contents to a 1.4MB floppy disk using another Macintosh and its internal hard disk.

Copy a mass-duplicated disk to 1.4MB disk

If mass duplicated 800K disks are unreadable on your Macintosh AV, copy the contents to a 1.4MB floppy disk using another Macintosh and its internal hard disk OR call the software vendor to see if they can send you another copy on 1.4 MB floppy disk.

Perform a network install

Perform a network install or copy the software from another Macintosh over an AppleTalk network onto the Macintosh AV.

Contact the supplier of copy-protected disks

If 800K copy protected floppy disks are not readable, contact the supplier to obtain either a more stringently written floppy, or see if they will provide a non copy protected version.

Quadra 840AV: On & Off Switch (8/93)

Revised: 8/10/93
Security: Everyone

Quadra 840AV: On & Off Switch (8/93)

==========

Article created: 10 August 1993

TOPIC ----------

This article explains the on and off switch on the Macintosh Quadra 840AV.

DISCUSSION ----------

Under most conditions, you should use the Power key on the keyboard and the Shut Down command from the Special menu in the Finder to turn your Quadra 840AV on and off. If a program locks or hangs but you can still move the pointer, you can press and hold the on/off switch for 2 to 3 seconds to turn off the machine.

AV Series: Instlng Adj Kybrd & Audiovision 14 Dsply (1/94)

==========

Article Created: 10 August 1993
Article Reviewed/Updated: 7 January 1994

TOPIC ----------

What software do I install if I want to use the Apple AudioVision 14 Display and Apple Adjustable Keyboard with the Macintosh Centris 660AV, Quadra 660AV or Quadra 840AV?

DISCUSSION ----------

If you use both the Apple Adjustable Keyboard and the Apple AudioVision 14 Display with your computer, do not install the software supplied with the Apple Adjustable Keyboard. This software is already installed on your Macintosh Centris 660AV and Quadra 840AV computer.

To use this keyboard and this monitor with your computer, install only the software for the AudioVision 14 Display. (The reason for not installing the keyboard software is that it overwrites some necessary software for the monitor.)

If you have already installed the keyboard software, you should reinstall the Macintosh system software (included with your computer, on floppy disks or on a compact disc) to restore the files you need.

QuickTime for Windows: Version 1.1 Description (8/93)

Revised: 8/10/93
Security: Everyone

QuickTime for Windows: Version 1.1 Description (8/93)

==========

Article Created: 10 August 1993

TOPIC ----------

This article describes the improvements made in version 1.1 of QuickTime for Windows.

DISCUSSION ----------

QuickTime for Windows extends Windows 3.1 to integrate compressed video, graphics and sound in cross-platform file formats. The latest release, QuickTime for Windows 1.1, offers improved performance, easier integration with existing Windows applications, and open extensibility for third-party developers.

QuickTime for Windows 1.1 provides significantly improved performance through support for Apple Compact Video, the advanced software compression technology introduced in QuickTime 1.5 on the Macintosh. Integration into existing Windows applications has been made easier through support for Windows 3.1 MCI (Media Control Interface) and OLE (Object Linking & Embedding) release 1.0. Support for customized add-in products enable third-party developers to add features such as custom decompression technology. Like QuickTime for Windows 1.0, version 1.1 includes the same QuickTime Movie file format, human interface, image decompression capabilities and programming interface as the Macintosh version of QuickTime, making it easier for developers to implement direct support of QuickTime in Windows applications.

Increased Performance

QuickTime for Windows 1.1 supports the advanced Apple Compact Video codec (compressor/decompressor), introduced in QuickTime 1.5 for Macintosh, that enables Movies to play either at twice the frame rate (up to 30 frames per second) or across four times the screen area (up to 320x240 screen size, software only) as supported by the earlier release. QuickTime for Windows 1.1 supports playback through video acceleration hardware, when used with display drivers that directly support QuickTime for Windows.

Windows Integration

Integration of QuickTime Movies into existing Windows applications is now easier with the support for MCI and OLE 1.0 in QuickTime for Windows 1.1. The new support for MCI integrates QuickTime for Windows into authoring and presentation applications for precise playback control. With OLE support, QuickTime Movies can be easily integrated into business applications that support OLE, adding impact with video footage, animation sequences and sound clips to documents, spreadsheets and presentations. Microsoft's Visual Basic 2.0 is also supported for creation of custom Windows multimedia applications using QuickTime.

Third-Party Software Extension Support

Support for add-in decompressors will allow third-party developers to add their own compression technologies to those already included with QuickTime for Windows. Intel is using this method to bundle its Indeo video decompressor with QuickTime for Windows 1.1.

Third-Party Hardware Support

Additional audio and video cards are supported in QuickTime for Windows 1.1, giving more Windows customers access to QuickTime technology. Digital video in QuickTime Movies is optimized for playback on display cards capable of showing from 256 colors (8-bit) to 16 million colors (24-bit).

PowerBook 180
PowerBook 180c
PowerBook 190 Series - Must have external video upgrade
PowerBook 500 Series

PowerBook Duo 210 & 230 (with MiniDock or Duo Dock)

To connect a VGA monitor to the Macintosh video port, an adapter cable is required. Third-party cable vendors should have these cables available for purchase.

VGA monitors may have variances when purchased from different VGA monitor vendors. It is best to test a particular monitor for compatibility with the Macintosh before making a purchase decision.

VGA monitors also have different image quality specifications. There may be significant differences between Apple monitors and various VGA monitors. A side-by-side review of the monitors should be done before deciding which monitor to buy.

When a VGA monitor is connected, the resolution is 640x480. The bit-depth supported depends on the amount of VRAM installed in the computer.

Article Change History:
22 Apr 1996 - Added individual Power Macintosh models.
08 Jan 1996 - Updated list of Macintosh computers supporting VGA.
09 Jan 1995 - Noted that all Power Macintosh computers support VGA.

Macintosh IIx: 4MB SIMM RAM Upgrades (8/93)

Revised: 8/10/93
Security: Everyone

Macintosh IIx: 4MB SIMM RAM Upgrades (8/93)

==========

Article Created: 6 August 1993

TOPIC ----------

We are trying to upgrade a Macintosh IIx to 20MB of RAM. We can't find any information about Apple selling the special 4MB SIMMs that are required for this upgrade.

Also, when I upgrade the RAM on the IIx, do I need to add a PMMU chip, as with the Macintosh II?

DISCUSSION ----------

The Macintosh IIx has a 68030 microprocessor which has a PMMU built into it.

Apple does not sell 4MB SIMMs with PAL chips, as needed by the Macintosh IIx. You will need to contact a third-party memory vendor to obtain the proper SIMMs.

Standard 4MB SIMMs won't work on the Macintosh IIx because JEDEC, the committee overseeing the standardization of new solid-state devices, added an additional built-in test mode to high-density DRAMs. The test mode is invoked by a sequence of electrical signals which was ignored by earlier-generation DRAM. This specification for 4MB SIMMs was changed after the Macintosh IIx was developed. At the time the Macintosh IIx was developed, in theory, 4MB SIMMs should have worked. It wasn't known at the time that the specification would be changed.

The result is that standard 4MB SIMMs won't work on the Macintosh IIx. The special 4MB SIMMs available from third-party vendors have a PAL chip and can be used in either the Macintosh II or IIx.

Hardware System Update 2.0 & Display of Control Panels (8/93)

Revised: 8/10/93
Security: Everyone

Hardware System Update 2.0 & Display of Control Panels (8/93)

==========

Article Created: 6 August 1993

TOPIC -----

I recently installed the Hardware System Update 2.0 on my Macintosh. Now, some of the control panels (like NOW Menus, Remote Access Setup, and Startup Manager) have their top lines cut off. Also, the text displayed in the pop-up menus of the control panels was 12 point instead of the usual, smaller size.

DISCUSSION -----

A possible solution in this situation is to reset the Parameter RAM (PRAM) of your system. Do this by holding down the four keys Command, Option, P, R immediately upon startup until you hear the startup chime for the second time.

PowerBook Duo: Battery Charging Only Halfway (8/93)

Revised: 7/7/94
Security: Everyone

PowerBook Duo: Battery Charging Only Halfway (8/93)

==========

Article Created: 11 August 1993

TOPIC --------------------

The battery on my PowerBook Duo 230 will no longer charge more than halfway.

I tried to hold in the power button (on the back) for 5 seconds. I did this two times, both with the unit off and with it asleep, and nothing changed.

DISCUSSION --------------------

The battery may not be getting fully seated when it is inserted. Make sure it is firmly locked into position.

Holding in the power button on the back resets the Power Manager chip, and may not affect a problem with the battery specifically. It is possible that the battery itself is bad. Take the unit to a dealer for service.

Revised: 8/11/93
Security: Everyone

Macintosh Color Classic: External Pinouts (5/93)

==========

Article Created: 21 May 1993

TOPIC ----------

This article gives the pin assignments and functions for the external connectors on the Macintosh Color Classic.

DISCUSSION ----------

Apple Desktop Bus (ADB)

Pin	Signal name	Signal description
1	ADB	Data
2	PWRON	Power on
3	+5v	+5 volts DC
4	GND	Signal ground

- Connector type: 4-pin minicircular

- Total length of all cables not to exceed 5 m (16 ft.)

Modem and Printer Ports

Pin	Signal name	Signal description
1	HSKo	Handshake out
2	HSKi	Handshake in/external clock
3	TXD-	Transmit data -

4	GND	Signal ground
5	RXD-	Receive data -
6	TXD+	Transmit data +
7	NC	General purpose input*
8	RXD+	Receive data +

- Connector type: 8-pin minicircular

SCSI Port (25-pin)

Pin	Signal name	Signal description
1	REQ/	Request
2	MSG/	Message
3	I/O/	Input/Output
4	RST/	SCSI bus reset
5	ACK/	Acknowledge
6	BSY/	Busy
7	GND	Signal ground
8	DB0/	Data bit 0
9	GND	Signal ground
10	DB3/	Data bit 3
11	DB5/	Data bit 5
12	DB6/	Data bit 6
13	DB7/	Data bit 7
14	GND	Signal ground
15	C/D/	Common/Data
16	GND	Signal ground
17	ATN/	Attention
18	GND	Signal ground

19	SEL/	Select
20	DBP/	Data parity
21	DB1/	Data bit 1
22	DB2/	Data bit 2
23	DB4/	Data bit 4
24	GND	Signal ground
25	TPWR	Terminator power

- Connector type: DB-25

- Total length of all cables not to exceed 6 m (20 ft.)

WARNING: The SCSI port uses the same type of connector as a standard RS-232, DB-25 serial interface, but it is different electrically. Do not connect any RS-232 device to this connector. Doing so can result in damage to both the device and the Macintosh Classic.

Sound Input Jack

There is a sound input jack on the back of the computer for connecting an external microphone or other sound source. The sound input jack accepts a standard 1/8-inch phone plug, either monophonic or stereophonic (two signals plus ground).

The sound input jack accepts either the external microphone for the Macintosh Color Classic or a pair of line-level (amplified) signals. When the user selects the corresponding input device in the Sound control panel, the computer sets the gain appropriately. The internal circuitry mixes the pair of stereophonic signals into a monophonic signal.

Note: The Macintosh external microphone requires power from the main computer, which it obtains by way of an extra-long plug that makes contact with a 5-volt pin inside the sound input jack.

PowerBook Duo 210, 230, 250, 270c: External Pinouts (6/94)

Revised: 6/24/94
Security: Everyone

PowerBook Duo 210, 230, 250, 270c: External Pinouts (6/94)

==========

Article Created: 27 May 1993
Article Reviewed/Updated: 24 June 1994

TOPIC ----------

This article gives the pin assignments and functions for the external connectors on the Macintosh PowerBook Duo 210, Duo 230, Duo 250, and 270c.

DISCUSSION ----------

ADB connector signal assignments

Pin number	Signal name	Description
1	ADB	Bidirectional data bus for I/O
2	/POWER ON	Key on ADB keyboard grounds this pin-to-pin 4 to turn on power supply
3	+5V	+5 V power.
4	GND	Ground

Serial port connector signal assignments

Pin	Signal name	Description
1	HSKo	Handshake output. Connected to the Request to Send (RTS) pin on the Combo chip. Tristated when the Data Terminal Ready (DTR) signal is inactive.
2	HSKi	Handshake input. Connected to the Transmit Receive Clock (TRXC) pin on the Combo chip.

3	/TXD	Transmit data (inverted). Connected to the Transmit Data (TXD) pin on the Combo chip. Tristated when DTR is inactive
4	SG	Signal ground. Connected to logic and chassis ground.
5	/RXD	Receive data (inverted). Connected to the Receive Data (RXD) pin on the Combo chip.
6	TXD	Transmit data. Connected to the Transmit Data (TXD) pin on the Combo chip. Tristated when DTR is inactive
7	GPi	General purpose input. Connected to the Data Carrier Detect (DCD) pin on the Combo chip.
8	RXD	Receive data. Connected to the Receive Data (RXD) pin on the Combo chip.
9, 10, 11	GND	These pins are connected to chassis ground

PowerBook Duo Floppy Adapter

The drive is connected through a custom HDI-20 high-density connector.

Pin number	Signal name	Description
1, 2, 3, 4	GND	Ground
5, 10, 20	nc	No connection
6, 7, 8, 9	+5V	+5 V power for floppy drive
11	PH0	State-control line 0
12	PH1	State-control line 1
13	PH2	State-control line 2
14	PH3	State-control line 3
15	/WRREQ	Write data request
16	HDSEL	Head select
17	/ENBL	Floppy drive enable
18	RD	Read data
19	WR	Write data

Security: Everyone

Duo Dock/Duo Dock II: External Pinouts (3/95)

==========

Article Created: 27 May 1993
Article Reviewed/Updated: 22 March 1995

TOPIC ----------

This article gives the pin assignments and functions for the connectors on the Duo Dock and Duo Dock II.

DISCUSSION ----------

Main Expansion Connector (Processor-Direct Slot)

A 152-pin main expansion connector, JAE part number JX20-152BA-D1LTH, provides the interface between the PowerBook Duo computer, and the Duo Dock. It mounts directly to the Duo Dock's main logic board, and plugs into the matching connector on the PowerBook Duo rear panel, giving the Duo Dock direct access to the microprocessor's 32-bit address bus, 32-bit data bus, and control signals. It also provides access to power, control, and status signals in other parts of the computer, and allows the Duo Dock to provide power to the PowerBook Duo.

The table below lists the subset of signals used for the Duo Dock interface. A slash before a signal name (/AS) indicates an active-low signal.

Pin number	Signal name	Description
1, 2, 77, 78, 79	PR +24V EXT	Raw +24 V from AC adapter
3	/PLUG IN	Power surge control (grounded in the expansion device)
4, 19, 20, 30, 38, 39, 51, 61, 65, 66, 80, 81, 115, 141, 142	GND	Logic ground

7	/ON/OFF OUT	On/off button
9	/STERM	Synchronous termination
10	/DS	Data strobe
11	/AS	Address strobe
12, 29, 42,	+5V MAIN OUT	+5 V regulated power
13	/HALT	Halt
14	/BERR	Bus error
15	/BGACK	Bus grant acknowledge
21	ADDR[0]	Address bit 0
22	ADDR[2]	Address bit 2
23	ADDR[4]	Address bit 4
24	ADDR[6]	Address bit 6
25	ADDR[8]	Address bit 8
26	ADDR[10]	Address bit 10
27	ADDR[12]	Address bit 12
28	ADDR[14]	Address bit 14

130	DATA[26]	Data bit 26
131	DATA[27]	Data bit 27
132	DATA[28]	Data bit 28
133	DATA[29]	Data bit 29
134	DATA[30]	Data bit 30
135	DATA[31]	Data bit 31
137	/SWIM CS	SWIM chip select
138	/SLOT E IRQ	Pseudo-NuBus expansion slot E interrupt

139	/PFW	Power fail warning (shutdown bit)
140	/IO RESET	Reset output to I/O systems
143	DAA CNTLF	Modem DAA control
144	DAA ID IN	ID input from 152-pin connector to modem card
145	/RING DET	Ring detect signal from the modem DAA
146	/RB DVR	Modem relay B driver
147	/RA DVR	Modem relay A driver
148	EXT MIC SEL	External microphone plugged in

Video Port

The video connection is made through a standard DB-15 connector.

Pin number	Signal name	Description
1	RED GND	Red ground
2	RED VID	Red video signal
3	/CSYNC	Composite sync
4	SENSE0	Monitor sense bit 0
5	GRN VID	Green video signal
6	GRN GND	Green ground
7	SENSE1	Monitor sense bit 1
8	mc	No connection
9	BLU VID	Blue video signal
10	SENSE2	Monitor sense bit 2
11	C&VSYNC GND	Ground for CSYNC and VSYNC
12	/VSYNC	Vertical sync
13	BLU GND	Blue ground
14	HSYNC GND	HSYNC ground

15	HSYNC	Horizontal sync

HDI-30 SCSI Connector

Pin number	Signal name	Description
1	nc	Reserved for SCSI disk mode.
2	/DB0	Bit 0 of SCSI data bus
3, 8, 10, 12, 13, 15, 17, 20, 22, 24	GND	Ground
4	/DB1	Bit 1 of SCSI data bus
5	TPWR	Termination power
6	/DB2	Bit 2 of SCSI data bus
7	/DB3	Bit 3 of SCSI data bus
9	/ACKS	Handshake signal. When low acknowledges a request for data transfer
11	/DB4	Bit 4 of SCSI data bus
14	/DB5	Bit 5 of SCSI data bus
16	/DB6	Bit 6 of SCSI data bus
18	/DB7	Bit 7 of SCSI data bus
19	/DBP	SCSI data bus parity bit
21	/REQ	Request for a data transfer
23	/BSY	When active (low) indicates that the SCSI data bus is busy
25	/ATN	When active (low) indicates an attention condition
26	/C/D	When active (low) indicates that data is on the SCSI bus. When high, indicates that control signals are on the bus
27	/RST	SCSI bus reset
28	/MSG	Indicates the message phase

29	/SEL	SCSI select
30	/I/O	Controls the direction of data output. When high, data is input

Modem and Printer Ports

Pin number	Signal name	Description
1	HSKo	Handshake output. Connected to the Request to Send (RTS) pin on the Combo chip. Tristated when the Data Terminal Ready (DTR) signal is inactive.
2	HSKi	Handshake input. Connected to the Transmit Receive Clock(TRXC) pin on the Combo chip.
3	/TXD	Transmit data (inverted). Connected to the Transmit Data (TXD) pin on the Combo chip. Tristated when DTR is inactive.
4	SG	Signal ground. Connected to logic and chassis ground.
5	/RXD	Receive data (inverted). Connected to the Receive Data (RXD) pin on the Combo chip.
6	TXD	Transmit data. Connected to the Transmit Data (TXD) pin on the Combo chip. Tristated when DTR is inactive.
7	GPi	General purpose input. Connected to the Data Carrier Detect (DCD) pin on the Combo chip.
8	RXD+	Receive data. Connected to the Receive Data (RXD) pin on the Combo chip.
10, 11, 12	GND	These pins are connected to chassis ground.

Apple Desktop Bus Interface

Pin number	Signal name	Description

1	ADB	Bidirectional data bus for input and output
2	POWER ON	Key on ADB keyboard (if connected) grounds this pin to pin 4, enabling power to be turned on from the keyboard
3	+5V	+5 V power
4	GND	Logic ground
5, 6, 7	GND	Chassis ground

Sound Ports

Two monaural mini phone jacks provide connections for sound input and output.

Modem Adapter Card (optional)

When the PowerBook Duo computer is housed in the Duo Dock, you cannot access the integral modem via the RJ-11 connector on the PowerBook Duo's rear panel. A modem adapter card provides the connection. It plugs into the side of the Duo Dock's main logic board, using a 10-pin header connector. The card supplies the RJ-11 hook up, which is accessed on the rear panel of the Duo Dock. The adapter card interfaces with the modem card in the PowerBook Duo computer via its 10-pin connector, printed circuit traces, and the 152-pin expansion connector. The table below lists the signal assignments for the connector.

Modem Adapter Connector Signal Assignments

Pin number	Signal name	Description
1	LINET/R	Line/talk receive
2, 3, 4	DAA GND	Modem DAA ground
5	/RA DVR	Modem relay A driver
6	DAA ID IN	ID input
7	/RING3 DET	Ring detect signal
8	/RBDVR	Modem relay B driver
9	DAA CNTL	Modem DAA control
10	+5 V MODEM	+5 V power

Built-In Ethernet Connector (Duo Dock II only)

Pin	Signal Name	Signal Description
1	FN Pwr	Power (+12V @ 2.1W or +5V @ 1.9W)
2	DI-A	Data In circuit A
3	DI-B	Data In circuit B
4	VCC	Voltage Common
5	CI-A	Control In circuit A
6	CI-B	Control In circuit B
7	+5V	+5 volts (from host)
8	+5V	Secondary +5 volts (from host)
9	DO-A	Data Out circuit A
10	DO-B	Data Out circuit B
11	VCC	Secondary Voltage Common
12	NC	Reserved
13	NC	Reserved
14	FN Pwr	Secondary +12V @ 2.1W or +5V @ 1.9W
Shell	Protective Gnd	Protective Ground

AAUI signals have the same description, function, and electrical requirements as the AUI signals of the same name, as detailed in IEEE Standard 802.3-1990 CSMA/CD, section 7.

Article Change History:
22 Mar 1995 - Corrected wording of Duo Dock.
24 Jun 1994 - Added Duo Dock II information, revised formatting.

10	NC	No connection
11	PH0	Phase 0
12	PH1	Phase 1
13	PH2	Phase 2
14	PH3	Phase 3
15	WREQ/	Write request

16	HDSEL	Head select
17	ENBL2/	External drive select
18	RD	Read data
19	WD	Write data
20	NC	No connection

Video Port

Pin number	Signal name	Description
1	RED GND	Red ground
2	RED VID	Red video signal
3	/CSYNC	Composite sync
4	SENSE0	Monitor sense bit 0
5	GRN VID	Green video signal
6	GRN GND	Green ground
7	SENSE1	Monitor sense bit 1
8	mc	No connection
9	BLU VID	Blue video signal
10	SENSE2	Monitor sense bit 2
11	C&VSYNC GND	Ground for CSYNC and VSYNC
12	/VSYNC	Vertical sync
13	BLU GND	Blue ground
14	HSYNC GND	HSYNC ground
15	HSYNC	Horizontal sync

HDI-30 SCSI Connector

Pin number	Signal name	Description
1	nc	Reserved for SCSI disk mode.
2	/DB0	Bit 0 of SCSI data bus

3, 8, 10, 12, 13, 15, 17, 20, 22, 24	GND	Ground
4	/DB1	Bit 1 of SCSI data bus
5	TPWR	Termination power
6	/DB2	Bit 2 of SCSI data bus
7	/DB3	Bit 3 of SCSI data bus
9	/ACKS	Handshake signal. When low acknowledges a request for data transfer
11	/DB4	Bit 4 of SCSI data bus
14	/DB5	Bit 5 of SCSI data bus
16	/DB6	Bit 6 of SCSI data bus
18	/DB7	Bit 7 of SCSI data bus
19	/DBP	SCSI data bus parity bit
21	/REQ	Request for a data transfer
23	/BSY	When active (low) indicates that the SCSI data bus is busy
25	/ATN	When active (low) indicates an attention condition
26	/C/D	When active (low) indicates that data is on the SCSI bus. When high, indicates that control signals are on the bus
27	/RST	SCSI bus reset
28	/MSG	Indicates the message phase
29	/SEL	SCSI select
30	/I/O	Controls the direction of data output. When high, data is input

Modem and Printer Ports

Pin number	Signal name	Description
1	HSKo	Handshake output. Connected to the Request to Send (RTS) pin on the Combo chip. Tristated when the Data Terminal Ready (DTR) signal is inactive.
2	HSKi	Handshake input. Connected to the Transmit Receive Clock(TRXC) pin on the Combo chip.
3	/TXD	Transmit data (inverted). Connected to the Transmit Data (TXD) pin on the Combo chip. Tristated when DTR is inactive.
4	SG	Signal ground. Connected to logic and chassis ground.
5	/RXD	Receive data (inverted). Connected to the Receive Data (RXD) pin on the Combo chip.
6	TXD	Transmit data. Connected to the Transmit Data (TXD) pin on the Combo chip. Tristated when DTR is inactive.
7	GPi	General purpose input. Connected to the Data Carrier Detect (DCD) pin on the Combo chip.
8	RXD+	Receive data. Connected to the Receive Data (RXD) pin on the Combo chip.
10, 11, 12	GND	These pins are connected to chassis ground.

Apple Desktop Bus Interface

Pin number	Signal name	Description
1	ADB	Bidirectional data bus for input and output
2	POWER ON	Key on ADB keyboard (if connected) grounds this pin to pin 4, enabling power to be turned on from the keyboard
3	+5V	+5 V power

4	GND	Logic ground
5, 6, 7	GND	Chassis ground

Sound Ports

Two monaural mini phone jacks provide connections for sound input and output.

HDI-20: External Floppy Drive Pinouts (5/93)

==========

Article Created: 27 May 1993

TOPIC ----------

This article gives the pin assignments and signals for the external connectors on the HDI-20 floppy drive connector.

DISCUSSION ----------

HDI-20 floppy drive connector

Pin	Signal Name	Signal Description
1	GND	Signal ground
2	GND	Signal ground
3	GND	Signal ground
4	GND	Signal ground
5	NC	No connection
6	+5V	+5 volts DC
7	+5V	+5 volts DC
8	+5V	+5 volts DC
9	+5V	+5 volts DC
10	NC	No connection
11	PH0	Phase 0

12	PH1	Phase 1
13	PH2	Phase 2
14	PH3	Phase 3
15	WREQ/	Write request
16	HDSEL	Head select
17	ENBL2/	External drive select
18	RD	Read data
19	WD	Write data
20	NC	No connection

Macintosh II, IIfx, IIx: External Pinouts (5/93)

Revised: 8/11/93
Security: Everyone

Macintosh II, IIfx, IIx: External Pinouts (5/93)

==========

Article Created: 29 April 1993

TOPIC --------------------

This article gives the pin assignments and functions for the connectors on the Macintosh II, IIfx, and IIx computers.

DISCUSSION --------------------

Apple Desktop Bus (ADB)

Pin	Signal name	Signal description
1	ADB	Data
2	PWRON	Power on
3	+5v	+5 volts DC
4	GND	Signal ground

- Connector type: 4-pin minicircular

- Total length of all cables not to exceed 16 feet (5 meters)

Modem and Printer Ports

Pin	Signal name	Signal description
1	HSKo	Handshake out
2	HSKi	Handshake in/external clock
3	TXD-	Transmit data -

4	GND	Signal ground
5	RXD-	Receive data -
6	TXD+	Transmit data +
7	GPi	General purpose input*
8	RXD+	Receive data +

*Modem port only. Can be set in software to be a second external clock.

- Connector type: 8-pin minicircular

SCSI Port (25-pin)

Pin	Signal name	Signal description
1	REQ/	Request
2	MSG/	Message
3	I/O/	Input/Output
4	RST/	SCSI bus reset
5	ACK/	Acknowledge
6	BSY/	Busy
7	GND	Signal ground
8	DB0/	Data bit 0
9	GND	Signal ground
10	DB3/	Data bit 3
11	DB5/	Data bit 5
12	DB6/	Data bit 6
13	DB7/	Data bit 7
14	GND	Signal ground
15	C/D/	Common/Data
16	GND	Signal ground
17	ATN/	Attention

18	GND	Signal ground
19	SEL/	Select
20	DBP/	Data parity
21	DB1/	Data bit 1
22	DB2/	Data bit 2
23	DB4/	Data bit 4
24	GND	Signal ground
25	TPWR	Terminator power

- Connector type: DB-25

- Total length of all cables not to exceed 20 feet (6 meters)

WARNING: The SCSI port uses the same type of connector as a standard RS-232, DB-25 serial interface, but it is different electrically. Do not connect any RS-232 device to this connector. Doing so can result in damage to both the device and the Macintosh LC.

Audio Jack

Pin	Signal name	Signal description
(Sleeve)	GND	Signal ground
(Ring)	RIGHT	1.5 volt peak-to-peak audio signal, right channel
(Tip)	LEFT	1.5 volt peak-to-peak audio signal, left channel

- Connector type: Stereo miniature phone plug

- The internal speaker is disabled when this port is in use.

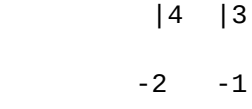
This article gives the pin assignments and functions for the external connectors on the Macintosh IIvsi.

DISCUSSION ----------

Apple Desktop Bus (ADB)

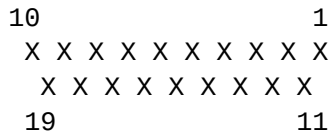
Pin	Signal	Description
1	DATA	ADB Data
2	PO	Power On
3	+5 V	+5 Volt
4	GND	Ground



DB-19 External Drive Connector

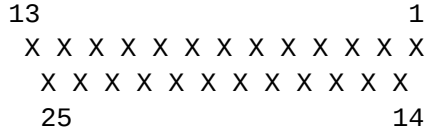
Pin	Signal	Description
1, 2, 3, 4	GND	Ground
5	-12 V	-12 Volt Supply
6	+5 V	+5 Volt Supply
7	+12 V	+12 Volt Supply
8	12 V	+12 Volt Supply
9	nc	(Not Connected)
10	+5 V	+5 Volt Supply
11	PHASE0	Motor Phase 0 Output
12	PHASE1	Motor Phase 1 Output

13	PHASE2	Motor Phase 2 Output
14	PHASE3	Motor Phase 3 Output
15	W/REQ	Write Request
16	SEL	Register Select Line
17	ENABLE2	Drive Enable
18	RD	Read Data Input
19	WR	Write Data Output



SCSI Port (25-pin)

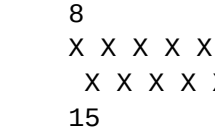
Pin	Signal	Description
1	REQ~	Request
2	MSG~	Message
3	I/O~	Input/Output
4	RST~	SCSI Bus Reset
5	ACK~	Acknowledge
6	BSY~	Busy
7	GND	Ground
8	DB0~	Data bit 0
9	GND	Ground
10	DB3~	Data bit 3
11	DB5~	Data bit 5
12	DB6~	Data bit 6
13	DB7~	Data bit 7
14	GND	Ground
15	C/D~	Command/Data
16	GND	Ground
17	ATN~	Attention
18	GND	Ground
19	SEL~	Select
20	DBP~	Data parity
21	DB1~	Data bit 1
22	DB2~	Data bit 2
23	DB4~	Data bit 4
24	GND	Ground
25	TPWR	Terminator power



WARNING: The SCSI port uses the same type of connector as a standard RS-232, DB-25 serial interface, but it is different electrically. Do not connect any RS-232 device to this connector. Doing so can result in damage to both the device and the Macintosh LC.

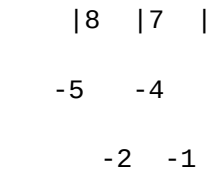
DB-15 Monitor Video Connector

Pin	Signal	Description
1	RED.GND	Red Video Ground
2	RED.VID	Red Video
3	CSYNC~	Composite Sync.
4	MON.ID1	Monitor ID, Bit 1
5	GRN.VID	Green Video
6	GRN.GND	Green Video Ground
7	MON.ID2	Monitor ID, Bit 2
8	nc	(Not Connected)
9	BLU.VID	Blue Video
10	MON.ID3	Monitor ID, Bit 3
11	C&VSYNC.GND	CSYNC & VSYNC Ground
12	VSYNC~	Vertical Sync.
13	BLU.GND	Blue Ground
14	HSYNC.GND	HSYNC Ground
15	HSYNC~	Horizontal Sync.
Shell	CHASSIS.GND	Chassis Ground



Modem and Printer Ports

Pin	Signal	Description
1	HSKo	Handshake Output DTR
2	HSKi	Handshake Input CTS
3	TxD-	Transmit Data (inverted)
4	SG	Signal Ground
5	RxD-	Receive Data (inverted)
6	TxD+	Transmit Data
7	GPi	General Purpose Input DCD
8	RxD+	Receive Data



Microphone Input Jack

Contact	Signal	Description

(Tip)	+8V	+8V for powering electret microphone
(Ring)	Right	Audio input with max amplitude of 20 mV at 600 Ohms impedance.
(Sleeve)	GND	Signal ground

Audio Output Jack - Stereo

Contact	Signal	Description
(Sleeve)	GND	Signal ground
(Tip)	Left	1-volt peak-to-peak audio signal; imped 47 Ohms
(Ring)	Right	1-volt peak-to-peak audio signal; imped 47 Ohms

Macintosh LC, LC II, and Performa 400: External Pinouts (2/96)

Revised: 2/28/96
Security: Everyone

Macintosh LC, LC II, and Performa 400: External Pinouts (2/96)

==========

Article Created: 29 April 1993
Article Reviewed/Updated: 28 February 1996

TOPIC ----------

This article provides the pin assignments and functions for the connectors on the back panels of the Macintosh LC, LC II, and Performa 400 computers.

DISCUSSION ----------

Begin_Table

Apple Desktop Bus (ADB)		
Pin	Signal name	Signal description
1	ADB	Data
2	PSW	Reset Key*
3	+5v	+5 volts DC
4	GND	Signal ground

Notes:
* Reset signal used to generate Reset and Interrupt Key combinations

Connector type: 4-pin minicircular

Total length of all cables not to exceed 5 m (16 ft)

Modem and Printer Ports

Pin	Signal name	Signal description
1	HSKo	Handshake out
2	HSKi	Handshake in/external clock
3	TXD-	Transmit data -
4	GND	Signal ground
5	RXD-	Receive data -
6	TXD+	Transmit data +
7	GPi	General purpose input*
8	RXD+	Receive data +

* Notes:
Not connected. The chip combines the functions of the 8550 (SCC) and the 53C80/53C96 (SCSI) into a single chip. This chip does not have GPi capabilities, so the computers that use it have no GPi functionality.

Connector type: 8-pin minicircular

SCSI Port (25-pin)

Pin	Signal name	Signal description
1	REQ/	Request
2	MSG/	Message
3	I/O/	Input/Output
4	RST/	SCSI bus reset
5	ACK/	Acknowledge
6	BSY/	Busy
7	GND	Signal ground
8	DB0/	Data bit 0

9	GND	Signal ground
10	DB3/	Data bit 3
11	DB5/	Data bit 5
12	DB6/	Data bit 6
13	DB7/	Data bit 7
14	GND	Signal ground
15	C/D/	Common/Data
16	GND	Signal ground
17	ATN/	Attention
18	GND	Signal ground
19	SEL/	Select
20	DBP/	Data parity
21	DB1/	Data bit 1
22	DB2/	Data bit 2
23	DB4/	Data bit 4
24	GND	Signal ground
25	TPWR	Terminator power

WARNING:
The SCSI port uses the same type of connector as a standard RS-232, DB-25 serial interface, but it is different electrically. Do not connect any RS-232 device to this connector. Doing so can result in damage to both the device and the Macintosh computer.

IMPORTANT:
Total length of all cables not to exceed 6 m (20 ft)

Connector type: DB-25

Video Port

Pin	Signal name	Signal description
1	RED.GND	Red video ground
2	RED.VID	Red video
3	CSYNC/	Composite sync
4	MON.ID1	Monitor ID, bit 1
5	GRN.VID	Green video
6	GRN.GND	Green video ground
7	MON.ID2	Monitor ID, bit 2
8	NC	No connection
9	BLU.VID	Blue video
10	MON.ID3	Monitor ID, bit 3
11	C&VSYNC.GND	Composite & vertical sync ground
12	VSYNC/	Vertical sync
13	BLU.GND	Blue video ground
14	HSYNC.GND	Horizontal sync ground
15	HSYNC/	Horizontal sync
Shell	CHASSIS.GND	Chassis ground
Connector type: DB-15		

Sound Output Port		
Pin	Signal name	Signal description
Sleeve	GND	Signal ground
Middle	AUDIO	1 volt peak-to-peak audio signal, right channel
Tip	AUDIO	1 volt peak-to-peak audio signal, left channel

NOTES: The internal speaker is disabled when this port is in use.
Connector type: Stereo miniature phone plug

Sound Input Port

Pin	Signal name	Signal description
Sleeve	GND	Signal ground
Middle	MicPWR	Microphone power, +8 volts +/- 5% @ 1mA
Tip	SND.IN	Sound input signal, 1.6K ohm +/- 10% impedance, 4 mV maximum signal without clipping.

End_Table

Article Change History:
28 Feb 1996 - Added additional notes on GPI pin.

Macintosh LC III and Performa 450: External Pinouts (5/93)

Revised: 8/11/93
Security: Everyone

Macintosh LC III and Performa 450: External Pinouts (5/93)

==========

Article Created: 21 May 1993

TOPIC ----------

This article gives the pin assignments and functions for the external connectors on the Macintosh LC III and Performa 405, 430, and 450:

DISCUSSION ----------

Apple Desktop Bus (ADB)

Pin number	Signal name	Signal description
1	ADB	Bidirectional data bus used for input and output. An open-collector signal pulled up to +5 volts through a 470 ohm resistor on the main logic board.
2	PSW	Power-on signal.
3	+5V	+5 volts from the computer. Maximum current draw is 200 mA. A 1-amp fuse at the output satisfies safety requirements.
4	GND	Ground from the computer.

Modem and Printer Ports

Pin number	Signal name	Signal description
1	HSKo	Handshake output
2	HSKi	Handshake input
3	TxD-	Transmit data -

4	SG	Signal ground
5	RxD-	Receive data -
6	TxD+	Transmit data +
7	GPi	General-purpose input
8	RxD+	Receive data +

SCSI Port (25-pin)

Pin	Signal name	Signal description
1	REQ/	Request
2	MSG/	Message
3	I/O/	Input/Output
4	RST/	SCSI bus reset
5	ACK/	Acknowledge
6	BSY/	Busy
7	GND	Signal ground
8	DB0/	Data bit 0
9	GND	Signal ground
10	DB3/	Data bit 3
11	DB5/	Data bit 5
12	DB6/	Data bit 6
13	DB7/	Data bit 7
14	GND	Signal ground
15	C/D/	Common/Data
16	GND	Signal ground
17	ATN/	Attention
18	GND	Signal ground
19	SEL/	Select

20	DBP/	Data parity
21	DB1/	Data bit 1
22	DB2/	Data bit 2
23	DB4/	Data bit 4
24	GND	Signal ground
25	TPWR	Terminator power

- Connector type: DB-25

- Total length of all cables not to exceed 6 m (20 ft.)

WARNING: The SCSI port uses the same type of connector as a standard RS-232, DB-25 serial interface, but it is different electrically. Do not connect any RS-232 device to this connector. Doing so can result in damage to both the device and the computer.

External Video Connector Pinout

Pin	Signal name	Description
1	RED.GND	Red video ground
2	RED.VID	Red video signal
3	/CSYNC	Composite synchronization signal
4	SENSE0	Monitor sense signal 0
5	GRN.VID	Green video signal
6	GRN.GND	Green video ground
7	SENSE1	Monitor sense signal 1
8	n.c.	Not connected
9	BLU.VID	Blue video signal
10	SENSE2	Monitor sense signal 2
11	GND	CSYNC and VSYNC ground
12	/VSYNC	Vertical synchronization signal
13	BLU.GND	Blue video ground

14	HSYNC.GND	HSYNC ground
15	/HSYNC	Horizontal synchronization signal

PowerBook 100 : External Pinouts (5/93)

Revised: 8/11/93
Security: Everyone

PowerBook 100 : External Pinouts (5/93)

==========

Article Created: 27 May 1993

TOPIC -----

This article gives the pin assignments and functions for the external connectors on the PowerBook 100.

DISCUSSION -----

Apple Desktop Bus (ADB)

Pin	Signal name	Signal description
1	ADB	Data
2	PWRON	Power on
3	+5v	+5 volts DC
4	GND	Signal ground

- Connector type: 4-pin minicircular

- Total length of all cables not to exceed 5 m (16 ft.)

Printer Port

Pin	Signal name	Signal description
1	HSKo	Handshake out
2	HSKi	Handshake in/external clock
3	TXD-	Transmit data -

4	GND	Signal ground
5	RXD-	Receive data -
6	TXD+	Transmit data +
7	NC	General purpose input*
8	RXD+	Receive data +

- Connector type: 8-pin minicircular

HDI-30 SCSI Connector

Pin number	Signal name	Description
1	nc	Reserved for SCSI disk mode.
2	/DB0	Bit 0 of SCSI data bus
3, 8, 10, 12, 13, 15, 17, 20, 22, 24	GND	Ground
4	/DB1	Bit 1 of SCSI data bus
5	TPWR	Termination power
6	/DB2	Bit 2 of SCSI data bus
7	/DB3	Bit 3 of SCSI data bus
9	/ACKS	Handshake signal. When low acknowledges a request for data transfer
11	/DB4	Bit 4 of SCSI data bus
14	/DB5	Bit 5 of SCSI data bus
16	/DB6	Bit 6 of SCSI data bus
18	/DB7	Bit 7 of SCSI data bus
19	/DBP	SCSI data bus parity bit
21	/REQ	Request for a data transfer
23	/BSY	When active (low) indicates that the SCSI data bus is busy

25	/ATN	When active (low) indicates an attention condition
26	/C/D	When active (low) indicates that data is on the SCSI bus. When high, indicates that control signals are on the bus
27	/RST	SCSI bus reset
28	/MSG	Indicates the message phase
29	/SEL	SCSI select
30	/I/O	Controls the direction of data output. When high, data is input

HDI-20 Floppy Drive Connector

Pin	Signal Name	Signal Description
1	GND	Signal ground
2	GND	Signal ground
3	GND	Signal ground
4	GND	Signal ground
5	NC	No connection
6	+5V	+5 volts DC
7	+5V	+5 volts DC
8	+5V	+5 volts DC
9	+5V	+5 volts DC
10	NC	No connection
11	PH0	Phase 0
12	PH1	Phase 1
13	PH2	Phase 2
14	PH3	Phase 3
15	WREQ/	Write request
16	HDSEL	Head select

17	ENBL2/	External drive select
18	RD	Read data
19	WD	Write data
20	NC	No connection

Audio Output Connector

Pin	Signal name	Signal description
(Sleeve)	GND	Signal ground
(Tip)	Left	0.75-volt peak-to-peak audio signal with an impedance of 47 Ohms; left channel
(Ring)	Right	0.75-volt peak-to-peak audio signal with an impedance of 47 Ohms; right channel

Connector type: Stereo miniature phone plug (3.6 mm)

Note: The PowerBook 100 outputs a monaural signal on both channels.

Article Created: 27 May 1993

TOPIC -----

This article gives the pin assignments and functions for the external connectors on the PowerBook 140, 145, and 170.

DISCUSSION -----

Apple Desktop Bus (ADB)

Pin	Signal name	Signal description
1	ADB	Data
2	PWRON	Power on
3	+5v	+5 volts DC
4	GND	Signal ground

- Connector type: 4-pin minicircular

- Total length of all cables not to exceed 5 m (16 ft.)

Modem and Printer Ports

Pin	Signal name	Signal description
1	HSKo	Handshake out
2	HSKi	Handshake in/external clock
3	TXD-	Transmit data -

4	GND	Signal ground
5	RXD-	Receive data -
6	TXD+	Transmit data +
7	NC	General purpose input*
8	RXD+	Receive data +

- Connector type: 8-pin minicircular

HDI-30 SCSI Connector

Pin number	Signal name	Description
1	nc	Reserved for SCSI disk mode.
2	/DB0	Bit 0 of SCSI data bus
3, 8, 10, 12, 13, 15, 17, 20, 22, 24	GND	Ground
4	/DB1	Bit 1 of SCSI data bus
5	TPWR	Termination power
6	/DB2	Bit 2 of SCSI data bus
7	/DB3	Bit 3 of SCSI data bus
9	/ACKS	Handshake signal. When low acknowledges a request for data transfer
11	/DB4	Bit 4 of SCSI data bus
14	/DB5	Bit 5 of SCSI data bus
16	/DB6	Bit 6 of SCSI data bus
18	/DB7	Bit 7 of SCSI data bus
19	/DBP	SCSI data bus parity bit
21	/REQ	Request for a data transfer
23	/BSY	When active (low) indicates that the SCSI data bus is busy

25	/ATN	When active (low) indicates an attention condition
26	/C/D	When active (low) indicates that data is on the SCSI bus. When high, indicates that control signals are on the bus
27	/RST	SCSI bus reset
28	/MSG	Indicates the message phase
29	/SEL	SCSI select
30	/I/O	Controls the direction of data output. When high, data is input

Audio Output Connector

Pin	Signal name	Signal description
(Sleeve)	GND	Signal ground
(Tip)	Left	0.75-volt peak-to-peak audio signal with an impedance of 47 Ohms; left channel
(Ring)	Right	0.75-volt peak-to-peak audio signal with an impedance of 47 Ohms; right channel

Connector type: Stereo miniature phone plug (3.6 mm)

Audio Input Connector (Stereo)

Pin	Signal name	Signal description
(Tip)	+8V	+8 volts for powering electret microphone
(Ring)	Right	Audio input with a maximum amplitude of 20 mV at 600 ohms impedance
(Sleeve)	GND	Signal ground

Connector type: Stereo miniature phone plug (3.6 mm)

Warning: Don't connect any device other than the Macintosh microphone. Doing so could damage the device or the computer.

19	/DBP	SCSI data bus parity bit
21	/REQ	Request for a data transfer
23	/BSY	When active (low) indicates that the SCSI data bus is busy

25	/ATN	When active (low) indicates an attention condition
26	/C/D	When active (low) indicates that data is on the SCSI bus. When high, indicates that control signals are on the bus
27	/RST	SCSI bus reset
28	/MSG	Indicates the message phase
29	/SEL	SCSI select
30	/I/O	Controls the direction of data output. When high, data is input

Video Port

The video connection is made through a standard DB-15 connector.

Pin number	Signal name	Description
1	RED GND	Red ground
2	RED VID	Red video signal
3	/CSYNC	Composite sync
4	SENSE0	Monitor sense bit 0
5	GRN VID	Green video signal
6	GRN GND	Green ground
7	SENSE1	Monitor sense bit 1
8	mc	No connection
9	BLU VID	Blue video signal
10	SENSE2	Monitor sense bit 2
11	C&VSYNC GND	Ground for CSYNC and VSYNC
12	/VSYNC	Vertical sync
13	BLU GND	Blue ground
14	HSYNC GND	HSYNC ground

15	HSYNC	Horizontal sync

Audio Output Connector

Pin	Signal name	Signal description
(Sleeve)	GND	Signal ground
(Tip)	Left	0.75-volt peak-to-peak audio signal with an impedance of 47 Ohms; left channel
(Ring)	Right	0.75-volt peak-to-peak audio signal with an impedance of 47 Ohms; right channel

Connector type: Stereo miniature phone plug (3.6 mm)

Macintosh Plus: External Pinouts (5/93)

==========

Article Created: 29 April 1993

TOPIC ----------

This article gives the pin assignments and functions for the external connectors on the Macintosh Plus.

DISCUSSION ----------

Mouse Connector

Pin	Name	Description, Notes
1	CGND	Chassis ground
2	+5V	See hardware Description, Notes for power limits
3	CGND	Chassis ground
4	X2	Horizontal movement line (connected to VIA PB4 line)
5	X1	Horizontal movement line (connected to SCC DCDA- line)
6	N-C	Not connected
7	SW-	Mouse button line (connected to VIA PB3)
8	Y2	Vertical movement line (connected to VIA PB5 line)
9	Y1	Vertical movement line (connected to SCC DCDB- line)

Keyboard Connector

Pin	Name	Description, Notes
1	CGNB	Chassis ground
2	KBD1	Keyboard clock
3	KBD2	Keyboard data
4	+5V	

External Drive Connector

Pin	Name	Description, Notes
1	CGNB	Chassis ground
2	CGND	Chassis ground
3	CGND	Chassis ground
4	CGND	Chassis ground
5	-12V	
6	+5V	
7	+12V	
8	+12V	
9	N-C	Not connected
10	PWM	Regulates speed of the drive
11	CA0	Control line to send commands to the drive
12	CA1	Control line to send commands to the drive
13	CA2	Control line to send commands to the drive
14	LSTRB	Control line to send commands to the drive
15	WrReq-	Turns on the ability to write data to the drive
16	HdSel	Control line to send commands to the drive
17	Enbl2-	Enables the Rd line (else Rd is tristated)
18	Rd	Data actually read from the drive
19	Wr	Data actually written to the drive

Modem and Printer Ports

Pin	Signal name	Signal description
1	HSKo	Handshake out
2	HSKi	Handshake in/external clock
3	TXD-	Transmit data -
4	GND	Signal ground
5	RXD-	Receive data -
6	TXD+	Transmit data +
7	NC	General purpose input*
8	RXD+	Receive data +

- Connector type: 8-pin minicircular

SCSI Port (25-pin)

Pin	Signal name	Signal description
1	REQ/	Request

2	MSG/	Message
3	I/O/	Input/Output
4	RST/	SCSI bus reset
5	ACK/	Acknowledge
6	BSY/	Busy
7	GND	Signal ground
8	DB0/	Data bit 0
9	GND	Signal ground
10	DB3/	Data bit 3
11	DB5/	Data bit 5
12	DB6/	Data bit 6
13	DB7/	Data bit 7
14	GND	Signal ground
15	C/D/	Common/Data
16	GND	Signal ground
17	ATN/	Attention
18	GND	Signal ground
19	SEL/	Select
20	DBP/	Data parity
21	DB1/	Data bit 1
22	DB2/	Data bit 2
23	DB4/	Data bit 4
24	GND	Signal ground
25	NC	No connection

- Connector type: DB-25

- Total length of all cables not to exceed 6 m (20 ft.)

WARNING: The SCSI port uses the same type of connector as a standard RS-232,

DB-25 serial interface, but it is different electrically. Do not connect any RS-232 device to this connector. Doing so can result in damage to both the device and the Macintosh Classic.

Audio Output Port

Pin	Signal name	Signal description
(Sleeve)	GND	Signal ground
(Tip)	AUDIO	.5 volt peak-to-peak audio signal

- Connector type: Miniature mono phone plug

- The internal speaker is disabled when this port is in use.

==========

Article Created: 29 April 1993

TOPIC ----------

This article gives the pin assignments and functions for the connectors on the Macintosh Portable.

DISCUSSION ----------

Apple Desktop Bus (ADB)

Pin	Signal name	Signal description
1	ADB	Data
2	NC	Reserved
3	+5 V	+5 volts DC
4	GND	Signal ground

- Connector type: 4-pin minicircular

- Total length of all cables not to exceed 5 meters (16 feet).

Disk Drive Port

Pin	Signal name	Signal description
1	GND	Signal ground
2	GND	Signal ground
3	GND	Signal ground

4	GND	Signal ground
5	NC	No connection
6	+5 V	+5 volts DC
7	+12 V	+12 volts DC
8	+12 V	+12 volts DC
9	NC	No connection
10	PWM	Mode select
11	PH0	Register select CA0
12	PH1	Register select CA1
13	PH2	Register select CA2
14	PH3	Register write strobe LSTRB
15	WRREQ/	Write request
16	SEL	Register select line SEL
17	ENBL/	Drive enable
18	RD	Read data
19	WR	Write data

- Connector type: DB-19

SCSI Port (25-pin)

Pin	Signal name	Signal description
1	REQ/	Request
2	MSG/	Message
3	I/O/	Input/Output
4	RST/	SCSI bus reset
5	ACK/	Acknowledge
6	BSY/	Busy
7	GND	Signal ground

8	DB0/	Data bit 0
9	GND	Signal ground
10	DB3/	Data bit 3
11	DB5/	Data bit 5
12	DB6/	Data bit 6
13	DB7/	Data bit 7
14	GND	Signal ground
15	C/D/	Command/Data
16	GND	Signal ground
17	ATN/	Attention
18	GND	Signal ground
19	SEL/	Select
20	DBP/	Data parity
21	DB1/	Data bit 1
22	DB2/	Data bit 2
23	DB4/	Data bit 4
24	GND	Signal ground
25	NC	No connection

- Connector type: DB-25

- Total length of all cables not to exceed 6 meters (20 feet).

WARNING: The SCSI port uses the same type of connector as a standard RS-232, DB-25 serial interface, but it is different electrically. Do not connect any RS-232 device to this connector. Doing so can result in damage to both the device and the Macintosh LC.

Video Port

Pin	Signal name	Signal description
1	FPDATA(0)	Flat panel display data bus (bit 0)
2	FPDATA(1)	Flat panel display data bus (bit 1)

3	+5 V	+5 volts DC
4	FPDATA(2)	Flat panel display data bus (bit 2)
5	FPDATA(3)	Flat panel display data bus (bit 3)
6	FPDATA(4)	Flat panel display data bus (bit 4)
7	GND	Ground
8	+5 V	+5 volts DC
9	GND	Ground
10	FPDATA(5)	Flat panel display data bus (bit 5)
11	FPDATA(6)	Flat panel display data bus (bit 6)
12	FPDATA(7)	Flat panel display data bus (bit 7)
13	BATT_ VOLTAGE	Direct connect to main battery
14	FLM	Flat panel new frame sync
15	CL2 /	Flat panel display data clock

Modem and Printer Ports

Pin	Signal name	Signal description
1	HSKo	Handshake out
2	HSKi	Handshake in/external clock
3	TXD-	Transmit data -
4	GND	Signal ground
5	RXD-	Receive data -
6	TXD+	Transmit data +
7	GPi	General purpose input*
8	RXD+	Receive data +

*Modem port only: Can be set in software to be a synchronous external clock.

- Connector type: 8-pin minicircular

Audio Jack

Pin	Signal name	Signal description
Sleeve	GND	Signal ground
Ring	Right	0.75 volt peak-to-peak audio signal, right channel
Tip	Left	0.75 volt peak-to-peak audio signal, left channel

- Connector type: Stereo miniature phone plug

- The internal speaker is disabled when this port is in use.

Power Adapter Port

Pin	Signal name	Signal description
Sleeve	GND	Ground
Tip	CHGR PWR	Power adapter, +7.5 volts

13	NC	Reserved
14	FN Pwr	Secondary +12V @ 2.1W or +5V @ 1.9W
Shell	Protective Gnd	Protective Ground

AAUI signals have the same description, function, and electrical requirements as the AUI signals of the same name, as detailed in IEEE Standard 802.3-1990 CSMA/CD, section 7.

The AAUI (Apple Attachment Unit Interface) connector is a 14-position, 0.050-inch-spaced ribbon contact connector.

13	BLU.GND	Blue video ground
14	HSYNC.GND	Horizontal sync ground
15	HSYNC/	Horizontal sync
Shell	CHASSIS.GND	Chassis ground

- Connector type: DB-15

Ethernet Connector

Pin	Signal Name	Signal Description
1	FN Pwr	Power (+12V @ 2.1W or +5V @ 1.9W)
2	DI-A	Data In circuit A
3	DI-B	Data In circuit B
4	VCC	Voltage Common
5	CI-A	Control In circuit A
6	CI-B	Control In circuit B
7	+5V	+5 volts (from host)
8	+5V	Secondary +5 volts (from host)
9	DO-A	Data Out circuit A
10	DO-B	Data Out circuit B
11	VCC	Secondary Voltage Common
12	NC	Reserved
13	NC	Reserved
14	FN Pwr	Secondary +12V @ 2.1W or +5V @ 1.9W
Shell	Protective Gnd	Protective Ground

AAUI signals have the same description, function, and electrical requirements as the AUI signals of the same name, as detailed in IEEE Standard 802.3-1990 CSMA/CD, section 7.

The AAUI (Apple Attachment Unit Interface) connector is a 14-position, 0.050-inch-spaced ribbon contact connector.

Line Input Connectors

Pin	Signal description
(Sleeve)	Digital ground
(Tip)	Audio input

Connector type: RCA phono plug

The back panel has two connectors--right and left channel. Stereo information is internally mixed to yuield a monaural signal.

Macintosh SE and SE 30: External Pinouts (5/93)

==========

Article Created: 29 April 1993

TOPIC ----------

This article gives the pin assignments and functions for the connectors on the back panels of the Macintosh SE and SE/30. The pinouts are the same with the exception of the audio output ports. The Macintosh SE provides a monaural signal and the Macintosh SE/30 a stereo signal. Appropriate information appears below.

DISCUSSION ----------

Apple Desktop Bus (ADB)

Pin	Signal name	Signal description
1	ADB	Data
2	NC	Reserved
3	+5v	+5 volts DC
4	GND	Signal ground

- Connector type: 4-pin minicircular

- Total length of all cables not to exceed 16 feet (5 meters)

SCSI Port (25-pin)

Pin	Signal name	Signal description
1	REQ/	Request
2	MSG/	Message

3	I/O/	Input/Output
4	RST/	SCSI bus reset
5	ACK/	Acknowledge
6	BSY/	Busy
7	GND	Signal ground
8	DB0/	Data bit 0
9	GND	Signal ground
10	DB3/	Data bit 3
11	DB5/	Data bit 5
12	DB6/	Data bit 6
13	DB7/	Data bit 7
14	GND	Signal ground
15	C/D/	Common/Data
16	GND	Signal ground
17	ATN/	Attention
18	GND	Signal ground
19	SEL/	Select
20	DBP/	Data parity
21	DB1/	Data bit 1
22	DB2/	Data bit 2
23	DB4/	Data bit 4
24	GND	Signal ground
25	TPWR	Terminator power

- Connector type: DB-25

- Total length of all cables not to exceed 20 feet (6 meters)

WARNING: The SCSI port uses the same type of connector as a standard RS-232, DB-25 serial interface, but it is different electrically. Do not connect any

RS-232 device to this connector. Doing so can result in damage to both the device and the Macintosh LC.

Modem and Printer Ports

Pin	Signal name	Signal description
1	HSKo	Handshake out
2	HSKi	Handshake in/external clock
3	TXD-	Transmit data -
4	GND	Signal ground
5	RXD-	Receive data -
6	TXD+	Transmit data +
7	GPi	General purpose input*
8	RXD+	Receive data +

*Modem port only. Can be set in software to be a second external clock.

- Connector type: 8-pin minicircular

Disk Drive Port

Pin	Signal name	Signal description
1	GND	Signal ground
2	GND	Signal ground
3	GND	Signal ground
4	GND	Signal ground
5	-12v	-12 volts DC
6	+5v	+5 volts DC
7	+12v	+12 volts DC
8	+12v	+12 volts DC
9	NC	No connection
1	PWM	Motor speed control

11	PH0	Register select CA0
12	PH1	Register select CA1
13	PH2	Register select CA2
14	PH3	Register write strobe LSTRB
15	WRREQ/	Write request
16	SEL	Register select line SEL
17	ENBL/	Drive enable
18	RD	Read data
19	WR	Write data

- Connector type: DB-19

Audio Jack for the Macintosh SE

Pin	Signal name	Signal description
(Sleeve)	GND	Signal ground
(Tip)	AUDIO	.5 volt peak-to-peak audio signal

- Connector type: Miniature mono phone plug

- The internal speaker is disabled when this port is in use.

Audio Jack for the Macintosh SE/30

Pin	Signal name	Signal description
(Sleeve)	GND	Signal ground
(Ring)	RIGHT	.75 volt peak-to-peak audio signal, right channel
(Tip)	LEFT	.75 volt peak-to-peak audio signal, left channel

- Connector type: Stereo miniature phone plug

- The internal speaker is disabled when this port is in use.

PowerBook External Monitor Freeze-up & Connectix Utils (8/93)

Revised: 7/8/94
Security: Everyone

PowerBook External Monitor Freeze-up & Connectix Utils (8/93)

==========

Article Created: 12 August 1993

TOPIC ----------

I have Connectix PowerBook Utilities (CPU) version 1.0 installed on my PowerBook with external monitor port.

When the PowerBook 160 or 180 (or other models with the video out feature) display dims after the set amount of time, and if a second monitor is attached, the display will not refresh when a key is depressed. Both the internal display and the external monitor light up but remain blank, except for the cursor. The only way to recover is to restart the computer.

DISCUSSION ----------

This version of CPU is not compatible with the video out feature of the new PowerBooks. Connectix does have a compatible version of the utility, 1.0j.

Version 2.0 of Connectix PowerBook Utilities also is available, with enhanced features as well as compatibility with all PowerBooks to date.

Call Connectix for the latest information and to obtain the current release of the software. To locate a vendor's address and phone numbers, use the vendor name as a search string.

LaserWriter: Emulator Font (8/93)

Revised: 8/16/93
Security: Everyone

LaserWriter: "Emulator Font" (8/93)

==========

Article Created: 13 August 1993

TOPIC --------------------

What is the "Emulator Font" found in some Apple LaserWriters?

Also, when a fonts list from a LaserWriter is printed, why is there no sample of text beside the listing for "Emulator Font"?

Finally, why is it not found in the LaserWriter IINTX (which has Hewlett-Packard emulation)?

DISCUSSION --------------------

From results of our tests, the "EmulatorFont" found in some of our LaserWriter printers is directly associated with HP PCL emulation.

Using PostScript commands to specifically select and use the "EmulatorFont", we were unable to get any output for that font while in PostScript mode.

With regard to why "EmulatorFont" does not show up in the LaserWriter IINTX, we believe that it is related to the different ROM versions in the printers, and how the Type 1 fonts in ROM are utilized in HP PCL mode.

Newton: How to Add Words to the Word List (8/93)

==========

Article Created: 12 August 1993

TOPIC -----

How do I add words to Newton's word list?

DISCUSSION -----

You can add words to Newton's word list with Newton's on-screen keyboard. Here are two ways to do that:

1) Double-tap words that Newton misinterprets. This will display the on-screen keyboard. Type in the correct word with your stylus, then tap Yes when Newton asks you if you want the word added to your personal word list.

2) Tap the keyboard icon inside the Preferences Menu or on the bottom left of the Note Pad to display. When the keyboard is displayed, type in the desired word with your stylus, then tap Add to add your word to the word list.

Only add words to your personal word list that you use often. Try not to add many short words, abbreviations or acronyms to the list, because it will slow down Newton's interpretive process and increase the likelihood of future mistakes.

If Newton seems to continuously misinterpret specific letters or words, you may want to go back to Letter Styles in the Preferences Menu and narrow or expand the styles you want Newton to recognize.

Startup Items Folder: Items Don't Always Launch (9/93)

Revised: 9/14/93
Security: Everyone

Startup Items Folder: Items Don't Always Launch (9/93)

==========

Article Created: 13 August 1993
Article Reviewed/Updated: 13 September 1993

TOPIC ----------

Sometimes when starting up a Macintosh, the system seems to ignore anything placed in the Startup Items folder (inside the System Folder). None of the items in the folder get launched on startup. As far as we can tell, this only happens when a piece of software -- an application, extension, or control panel -- puts up a dialog box during the startup process and waits for a user response. For instance, when AppleTalk Remote Access asks for a password during startup (if set up to require one, as with a Security Zone implemented) to enable answering calls, no other items in the Startup Items folder get opened or launched. (The ARA password is only requested when the Security Zone has been implemented.)

DISCUSSION ----------

The Macintosh handles instructions through what is called an event queue. All commands line up in the order they are received until the computer can respond to or take action on them. A piece of software should look at events as they are coming in, take action on the events meant for it, and leave events meant for other software intact in the queue.

But some software doesn't handle this event queue properly. Instead of ignoring a command not meant for it, the software -- such as the type that asks for user input on startup -- accepts, and promptly loses, all commands in the queue. The result is that commands not meant for that particular application or extension aren't acted upon.

If startup items aren't loading properly, watch the startup process for any dialog boxes that force interaction from the user. If not written properly, the software displaying the dialog box may be preventing items in the Startup Folder from running.

AppleTalk Remote Access version 1.0 behaves in this way when it's set to require a password on startup, as do some other programs. This characteristic will be fixed in a future version of AppleTalk Remote Access.

If you determine that another program is causing items in the Startup Items folder not to launch, then they may need to be modified as well. Contact the vendor of that software to find out if they are aware of the problem and if a more recent version of the program is available.

To locate a vendor's address and phone numbers, use the vendor name as a search string.

Macintosh LC 520 Server: Power Conservation (8/93)

==========

Article Created: 16 August 1993

TOPIC --

I want to use a Macintosh LC 520 as an AppleShare 3.0 server. Will there be any adverse effect on server performance as a result of the power conservation feature? Is screen dimming the only energy-saving feature of the Macintosh LC 520?

DISCUSSION --

The Macintosh LC 520's only energy-saving feature is screen dimming. There are no performance-related issues when the computer is in this mode.

When the screen is powered down, total system energy is reduced by approximately 50%:

- Regular power consumption for the Macintosh LC 520 is 60 watts (40 watts not including monitor)
- Power consumption reduces to approximately 30 watts in energy-saving mode.

Power to the screen is restored when you either press the mouse button or a key on the keyboard.

PowerBook Screens: Active vs. Passive Matrix Comparison (12/95)

Revised: 12/12/95
Security: Everyone

PowerBook Screens: Active vs. Passive Matrix Comparison (12/95)

==========

Article Created: 13 August 1993
Article Reviewed/Updated: 12 December 1995

TOPIC ----------

I noticed that there are several types of PowerBook screens. How do they differ?

DISCUSSION ----------

Comparison of Active vs. Passive Matrix Displays

All PowerBook screens employ LCD (liquid crystal display) technology. Liquid crystals are electrically polarized - one end is more positive than the other, and thus the crystals tend to orient themselves along the lines of an electric field. When no such field is present, they orient themselves randomly.

Liquid crystals are transparent to light, but they also polarize the light, constraining the vibrations of the light to a single orientation.

An LCD uses a combination of a fixed polarizing screen, and an electrically controlled liquid-crystal polarizer to make light and dark areas. When the liquid crystals are subjected to an electric field, all of the light passing through them becomes polarized with the same orientation.

The orientation of the fixed polarizing screen is exactly 90 degrees off, which effectively blocks the passage of any light. So when a liquid crystal display region or pixel is on, it appears to be dark.

When an LCD pixel is off, quite a bit of the randomly polarized light from the crystals is able to make it through the fixed polarizing screen, so the pixel appears to be light.

Passive matrix screens apply the electric field voltages along the edges of the screen, so that pixels appear light and dark at the intersection of rows and columns. Each pixel is passively responding to voltage differences applied along

the horizontal and vertical edges of the screen. It is difficult to get a large number of crystals to line up quickly, and completely. So passive matrix screens are relatively slow and provide less precise definition.

Active matrix screens use a single transistor at every single pixel location. This provides a good strong source of electric field, and it only has to act on a very tiny region of liquid crystals. So they are quite fast and every crystal in a pixel is lined up perfectly.

The merits of the passive screen are lower cost and lower power usage. But the angle at which you can view the screen undistorted is smaller than for an active-matrix screen. Also, a passive-matrix screen is not as bright as its active-matrix counterpart.

You may experience submarining on a passive-matrix screen, meaning the pointer tends to disappear momentarily when you move it quickly across the screen until it catches up with the trackball. You may also notice speed trails, or shadowy, comet-like trails following the pointer or other objects you drag around the screen. They disappear as quickly as they appear, but some users find them distracting.

An active-matrix screen is brighter and provides better definition. The screen is also less likely to distort when viewed at more extreme angles.

The following charts which PowerBook models have Active or Passive Matrix Displays:

Begin_Table

PB Model	B&W/Color/Grayscale	Active/Passive Matrix
100	B&W	Passive
140	B&W	Passive
145	B&W	Passive
145B	B&W	Passive
150	Grayscale (4 Grays)	Passive
160	Grayscale (16 Grays)	Passive
165c	Color (256 Colors)	Passive
170	B&W	Active
180	Grayscale (16 Grays)	Active
180c	Color (256 Colors)	Active
190	Grayscale (16 Grays)	Passive
190cs	Color (256 Colors)	Passive
520	Grayscale (16 Grays)	Passive
520c	Color (256 Colors)	Passive
540	Grayscale (64 Grays)	Active
540c	Color (256 Colors*)	Active
5300	Grayscale (16 Grays)	Passive
5300c/100 8/500	Color (256 Colors**)	Active
5300c/100 16/750	Color (thousands of colors**)	Active
5300cs	Color (256 Colors)	Passive
5300ce	Color (thousands of colors)	Active

Duo 210	Grayscale (16 Grays)	Passive
Duo 230	Grayscale (16 Grays)	Passive
Duo 250	Grayscale (16 Grays)	Active
Duo 270c	Color (256 Colors*)	Active
Duo 280	Grayscale (16 Grays)	Active
Duo 280c	Color (256 Colors*)	Active
Duo 2300c	Color (256 Colors*)	Active

* Thousands of colors in 640 by 400 mode
** The PowerBook 5300c computer is available in two configuartions.
One model has 512K of built-in VRAM, while the other has 1 MB.

End_Table

NOTE:
The descriptions in this table apply only to models sold in the United States. Europe and Asia have models that differ slightly from these configurations.

For more information and details about the amount of internal VRAM, number of colors available, and specific model numbers of the PowerBook 190 and 5300 series computers see the TIL article titled "PowerBook 5300 & 190 Series: Internal & External Video".

Fax/Modems: What to Look For (8/93)

Revised: 8/19/93
Security: Everyone

Fax/Modems: What to Look For (8/93)

==========

Article Created: 13 August 1993

TOPIC -----

What should I look for in an external fax/modem for my Performa computer?

DISCUSSION -----

Any external Hayes-compatible fax/modem will work with your Performa.

Your first considerations are price, speed and output quality. The rest is just a matter of what you think you need or want.

Here are some suggestions:

1) Look for background operation so the computer can receive a fax without forcing you to stop what you're working on.

2) Determine whether you need send-only or send-receive capability. Send-only can be significantly less expensive, but you will sacrifice the ability to receive incoming faxes at your desktop.

3) Some fax/modems feature an automatic redial function which you can configure to attempt to send your fax (in the background) multiple times at specific time increments. For instance, you could configure it to retry a busy receiver every five minutes for 50 minutes, or until successful transmission.

4) If you opt for a send/receive model, look for one with a View function. View allows you to read and manipulate faxed information on your screen. Models without this feature require you to print out received faxes in order to read them.

Macintosh: Using High-Density Disks in 800K Drives (01/95)

Revised: 1/13/95
Security: Everyone

Macintosh: Using High-Density Disks in 800K Drives (01/95)

==========

Article Created: 12 August 1993
Article Reviewed/Updated: 13 January 1995

TOPIC ----------

This article describes how to use a 1.4MB high-density disk in an 800K drive.

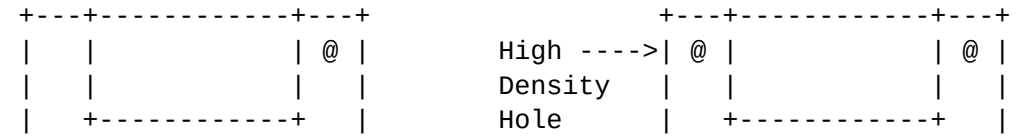
DISCUSSION ----------

If you take brand new high-density, “preformatted for Macintosh” floppy disks and copy some files off an earlier model Macintosh (such as a Macintosh Plus) to transfer them to a newer model Macintosh (such as a Performa). When you insert the disk in the newer model’s drive, you get the message “This disk is unreadable. Do you want to initialize it?”

This happens because you are using high-density disks to perform your file transfer, but the earlier Macintosh and the newer Macintosh do not use the same type of disk drive. The earlier models, along with most original Macintosh II models and some Macintosh SE systems do not have the high-density SuperDrive (or FDHD – floppy drive, high density) necessary to read and format a high-density disk.

So, if you insert a blank high-density disk in a double-density (800K) drive like the one in a Macintosh Plus, it does not know the difference between a double- density and a high-density floppy, and happily formats your expensive 1.4MB disk as an 800K disk.

When you move this disk to a Macintosh with a SuperDrive, the newer drive recognizes the disk as a high-density floppy by its extra hole. Since the disk has been formatted as 800K instead of as 1.4MB, the SuperDrive misreads it and asks you if you want to initialize it.



As a temporary workaround, place a small piece of tape over both sides of the extra hole (the one on the upper left when looking at the diskette from the front, as shown in the above diagram) on the high-density disk to trick the Macintosh into treating the disk as a double-density disk. This is a temporary solution, and the tape should be removed and the disk reformatted to the proper size as soon as possible.

Quadra, Centris: Drawback of Switching Caches On the Fly 8/93

Revised: 9/22/93
Security: Everyone

Quadra, Centris: Drawback of Switching Caches On the Fly 8/93

==========

Article Created: 16 August 1993

TOPIC -----

When I:
1) Change my Quadra 800's cache switch from "faster" to "more compatible" using the Option key, then
2) insert a disk, use it, eject it, and put it back in,
the disk is unreadable. I've seen this happen on a Centris 650 as well.

I tried this on a Quadra 700:
1) Holding option key, changed cache switch from "faster" to "more compatible."
2) Closed Cache control panel.
3) Inserted a disk.
4) Moved some files around, copied, or did nothing.
5) Ejected disk.
6) Re-inserted disk. The disk mounted fine

When I tried the same thing on a Quadra 800, the disk was unreadable. I then:
7) Reformatted the disk. When the format was complete, the disk would not mount.
8) Ejected disk (Command-Shift-1), and reinserted it. Still unreadable.

DISCUSSION -----

This sounds like a classic example of toggling the 68040 processor caches on/off on the fly.

Whenever the Quadra 700, Quadra 800, Quadra 840AV, Centris 650, or Centris 660AV -- or any other Quadra that doesn't contain Peripheral Interface Controllers (PIC chips) -- starts up, the system determines its effective processor speed (this has nothing to do with the 040's clock speed but with the mode of the processors caches) and sets certain internal timings according to this effective processor speed. Two of the more important

timings are for the floppy drive and LocalTalk. Therefore, when these Quadras' caches are switched without a restart, the timings set at startup are no longer valid and the floppy and LocalTalk may not work... or won't work reliably.

The Quadra 900 and 950 feature the PIC chips of the IIfx. These Quadras having these I/O processors seem to work fine after having the caches switched on/off on the fly.

Recommendation

On Quadras not having PICs, our recommendation is not to switch the 040 processor caches on/off on-the-fly.

Workaround

Alysis Software Corporation and others distribute cache switches they claim do not require users to restart to change the cache settings safely.

Retrospect A/UX: Supported Storage Devices (8/93)

Revised: 8/30/93
Security: Everyone

Retrospect A/UX: Supported Storage Devices (8/93)

==========

Article Created: 16 August 1993

TOPIC ----------

This article describes which storage devices Retrospect A/UX supports.

DISCUSSION ----------

Although Retrospect running under the Macintosh operating system supports a variety of storage devices with high reliability and performance, some devices are not suitable for use in an A/UX environment. In particular, the older or less standard SCSI tape drives can cause problems in the high-performance environment of the Workgroup Server 95.

The recommended, optimal storage drive for the Workgroup Server 95 is the Hewlett-Packard DS-DC DAT drive that may have come installed in your server. (This drive's capacity is between 1GB and 5GB.) For more information on this drive, see the Basic Skills document provided with the Apple Workgroup Server 95.

Macintosh Disk StorageSets are acceptable for data storage, but storing a large quantity of data on floppy disks is impractical. Also, the performance of large File StorageSets is slower in the A/UX environment because of the necessity of translating the file between Macintosh and A/UX formats.

For further information on working with Retrospect and Retrospect A/UX, search the Tech Info Library by "Retrospect" or "Remote."

Retrospect A/UX: Mixing A/UX & Macintosh Backups (8/93)

==========

Article Created: 16 August 1993

TOPIC -----

Can you mix A/UX & Macintosh backups using Retrospect A/UX?

DISCUSSION -----

You can mix Macintosh volumes and A/UX volumes in the same StorageSet. Retrospect's SnapShots keep track of volumes as usual. If you perform a StorageSet transfer to move A/UX files between StorageSets, Retrospect also copies the corresponding A/UX information for these files.

For further information on working with Retrospect and Retrospect A/UX, search the Tech Info Library by "Retrospect" or "Remote."

TCP/IP Connection for the Macintosh v. 2.0.2 (8/93)

Revised: 8/16/93
Security: Everyone

TCP/IP Connection for the Macintosh v. 2.0.2 (8/93)

==========

Article Created: 16 August 1993

TOPIC ----------

TCP/IP Connection for the Macintosh 2.0.2 supports SNMP, adds several features, and fixes several bugs.

DISCUSSION ----------

Installation

The TCP/IP software can now be installed using an Installer script. This script installs the MacTCP control panel, the MacTCP Token Ring Extension (if an Apple Token Ring NB card is available) and the software required to use SNMP on the Macintosh.

Note to PowerBook Duo Users with NSI 1.3

The MacTCP Easy Install option does not work on a PowerBook Duo 210 or 230. MacTCP can be installed on PowerBook Duos with the Custom Install option, although the SNMP portions will not work with the AppleTalk version running on the PowerBook Duo. This does not affect MacTCP's ability to communicate with other systems running TCP/IP nor will it affect TCP/IP applications such as telnet, ftp, mail, etc.

SNMP and Shared Library Manager cannot be easily installed onto a PowerBook Duo 210 or 230. An installer dialog will state that installation can only be done on systems with AppleTalk 58 (Network Software Installer 1.3) and higher. However, re-installing AppleTalk 58 using NSI 1.3 will not solve this installation problem. This is because NSI 1.3 does not properly install AppleTalk 58 on PowerBook Duos.

Network Software Installer 1.3.2 and higher solves the AppleTalk problem, allowing full SNMP functionality. TCP/IP Connection for Macintosh will be updated to include NSI 1.3.2, and the update will be freely available to registered users of TCP/IP Connection for Macintosh. Please contact your

Apple dealer for information on the latest NSI disk.

Do not attempt to install or use the Shared Library Manager or any SNMP component on a PowerBook Duo until NSI 1.3.2 or later has been successfully installed.

SNMP Support

After installing and starting your Macintosh, the system can be queried by SNMP for variables in the MIB-II specification (RFC 1213). Sets are allowed on only two variables, the default TTL field and the state variable in the TCP connection table. Sets are not allowed in either the address translation table or the net to media table. Sets in the state variable in the TCP table will cause a TCPAbort on the associated stream.

Additional Features

Additional features that have been added in this release are as follows:

- The MacTCP Control panel now shows the version number of MacTCP in the lower left corner of the control panel screen.

- When MacTCP is opened and its set IP address is in use by another system, MacTCP will display a notification alert giving the current IP address and the link address of the host that is using this IP address. This feature only works with the token ring and ethernet interfaces that are provided with MacTCP. MDev developers please see the section Developer changes and features in these release notes.

- MacTCP now ships with an ICMP Ping application.

Bugs that have been addressed

In this release bugs that have been addresed are as follows:

- MacTCP Token Ring Extension does not fail if token ring is not present.
- MacTCP control panel performance is improved for displaying large zone lists.
- MacTCP Token Ring Extension MTU value is interpreted unsigned.
- OpenResolver will not write to nil if given a filename.
- MacTCP now sends ICMP port unreachables.
- MacTCP Token Ring Extension default MTU is 2002 bytes.
- MacTCP DNR will not leak memory on repeated queries.
- Nonstandard addresses (see RFC 1122 page 30) using network number 0 are accepted (i.e. 192.0.0.0 and 128.0.0.0).
- MacTCP BootP hops set to 0.

Some issues to be aware of

- Since MacTCP installation will replace the SNMP Preferences file, save a copy of your modified file first.
- To reinstall the Shared Library Manager, use Custom Install.
- If you want to install the MacTCP Token Ring Extension on a machine with

no token ring card, Custom Install must be used.

- In the SNMP Trap table IP addresses must be specified with a trailing null character.

Developer changes and features

Two resources have been added to the MacTCP control panel file. The first resource is the 'arps' resource. This resource contains an integer that is the default ARP table size used by both the ethernet and token ring MacTCP MDevs. Applications that need to query a large number of local hosts (same wire) can set this value to improve the performance of MacTCP and the applications. The system must be restarted for this value to take effect. If you are developing MDevs that have address translation tables, use this value to adjust the size of the address translation tables. The resource is described as follows:

```
type 'arps' {
   unsigned longint;
   };

resource 'arps' (0) {
   20
   };
```

The other resource that has been added to the MacTCP control panel is as follows:

```
resource 'STR ' (130) {
   "Another device, which has the physical address ^1, is currently using
    the IP address ^0."
   };
```

The string displayed in this dialog is available to MDev developers to use. The IP Address of the associated offender should be placed in the ^0 position and the hardware address should be in the ^1 position. This string is provided so that localized versions of MacTCP will allow MDevs to use the appropriate string to notify users of IP address conflicts.

MacSNMP Release Notes (v 1.0.2)

In order to preserve the setting of communities, password, trap table, etc., the SNMP Preferences file has to be dragged outside the Extensions Folder before installing a new version of MacSNMP, and dragged back inside that folder upon completion of the installation.

Bug Fixes

- MacSNMP Admin and MacSNMP Client:

  Closing the community window sometimes crashed the MacSNMP Admin and MacSNMP Client.

- SNMP Macintosh Agent:

GetNext on the last element of one of the SystemFileTable's columns did not return the first element of the ApplTable.

SNMP Macintosh Agent now returns an INTEGER instead of a COUNTER for SystemFileTable.FileEntry.fileSize.

SNMP Macintosh Agent now returns an INTEGER instead of a COUNTER for ApplTable.ApplEntry.applSize.

- Macintosh System MIB:

  SystemFileTable.FileEntry.fileSize is now defined as INTEGER.

  ApplTable.ApplEntry.applSize is now defined as INTEGER.

  TrapTable.trapProtocol is now defined as Macintosh Display String.

Retrospect A/UX: Special Features (8/93)

Revised: 8/30/93
Security: Everyone

Retrospect A/UX: Special Features (8/93)

==========

Article Created: 16 August 1993

TOPIC ----------

This article describes the special features of Retrospect A/UX.

DISCUSSION ----------

Retrospect A/UX provides some special commands and options for choosing files with custom selectors and displaying information within browsers.

In Retrospect A/UX Selector windows, the pop-up menu of condition types contains an additional choice: file and folder selection by A/UX mode. You can use this additional condition type to select files by file type and privileges.

Within the A/UX window, the file type popup menu provides a variety of A/UX file types that you can apply to the Selector, including Named Pipe, Block Special, Symbolic Link, and Hard Linked File.

In addition, the Name (Sharing) condition window provides four new options for selecting files: A/UX owner name, A/UX group name, A/UX owner id, and A/UX group id.

For further information on working with Retrospect and Retrospect A/UX, search the Tech Info Library by "Retrospect" or "Remote."

Retrospect A/UX: Browser Options (8/93)

Revised: 8/16/93
Security: Everyone

Retrospect A/UX: Browser Options (8/93)

==========

Article Created: 16 August 1993

TOPIC --------------------

This article describes the browser options in Retrospect A/UX.

DISCUSSION --------------------

Retrospect A/UX browser options

Retrospect browsers showing the contents of A/UX volumes and StorageSets provide an additional view option: Display A/UX information.

When a browser is displayed, the Get Info command shows A/UX-specific information and includes node numbers for any multiply-linked files. In addition, the browser's Cross Reference command allows you to find all of the files that are linked to the highlighted file or files. See Chapter 6, "Customizing Backups," in the Retrospect User’s Guide for more information on using browsers.

For further information on working with Retrospect and Retrospect A/UX, search the Tech Info Library by "Retrospect" or "Remote."

Retrospect A/UX: Multiple Hard Disks & NFS Volumes (8/93)

Revised: 8/16/93
Security: Everyone

Retrospect A/UX: Multiple Hard Disks & NFS Volumes (8/93)

==========

Article Created: 16 August 1993

TOPIC --------------------

This article provides technical information on backing up multiple hard disks and NFS volumes under A/UX 3.0.1 with Retrospect A/UX.

DISCUSSION --------------------

Retrospect treats each A/UX file system separately, whether it is another hard disk or an NFS volume. As it scans files within the hierarchy, Retrospect will not descend within a mount point to cross a device boundary. This is also true for backing up or erasing files.

To back up or erase a mounted device or mounted NFS volume, you must define that device's mount point as a Retrospect subvolume, then back it up or erase it separately.

For further information on working with Retrospect and Retrospect A/UX, search the Tech Info Library by "Retrospect" or "Remote."

Retrospect A/UX: Special Considerations (8/93)

Revised: 8/30/93
Security: Everyone

Retrospect A/UX: Special Considerations (8/93)

==========

Article Created: 16 August 1993

TOPIC ----------

This article describes some special considerations for backing up A/UX volumes with Retrospect A/UX

DISCUSSION ----------

Because Retrospect A/UX uses the A/UX-Macintosh file translation features of the operating system, there are several factors that may affect the validity of a backup. Almost all limitations are inherent in the operating system and affect only the most esoteric configurations:

- Because standard Macintosh file systems are case-insensitive, Retrospect considers files that differ only in their case as referring to the same file. If A/UX settings are changed so that its file system is case-sensitive, it is possible for users to create two files in the same folder that differ only in case. Retrospect may fail to properly backup and restore such files.

- It is important that the operator ensure that toolbox translation option settings are consistent between backup and restore. For example, the toolbox environment variable TBTRANSLATEUXONLY controls the conversion of control characters within text files. If this option is changed between backup and restore, some files may be incorrectly translated. If you change them, you must make sure that they are set the same for backup and restore.

- Macintosh file and folder names are limited in length to 31 characters. It is possible to create A/UX files that are longer, but the additional characters will not be backed up or restored and no A/UX information will be stored for those files. (A warning is reported.)

  Also, A/UX files that are non-unique within the first 31 characters are invisible to the Macintosh environment and will silently be omitted from backups.

- Unlike most busy files, hybrid applications such as CommandShell are not accessible through the Macintosh environment when they are in use and will not be backed up; an error is reported instead.

- Current versions of the Macintosh A/UX environment use a synthetic Desktop Folder instead of a real directory to store files that appear on the desktop. This prevents access to the A/UX information for files on the desktop, but can also result in strange behavior. Do not store critical files on the desktop.

- Although Macintosh files restored by Retrospect are identical to the originals from a Macintosh point of view, the underlying A/UX file(s) will often be different from an A/UX point of view. These files are isomorphic instead of identical because the Macintosh resource forks and Finder information can be stored in a different order within the A/UX file. Therefore, A/UX's diff utility may report differences between two files while MPW's equal utility claims that they are identical. Pure A/UX files are always identical.

- Retrospect does not follow symbolic links when backing up files. Instead, it backs up only the link itself. In addition, files with multiple hard links are optimized to be copied only once, although all links are fully backed up.

- The A/UX creation and modification dates cannot be set for symbolic link files upon restore. Once the symbolic link file is created, any attempt to modify its information is redirected to the link's target. This means that symbolic link files are not incrementally restored -- they are copied even though they may already exist on the destination volume. Also, if a file is selected to be restored using a SnapShot, all hard links to that file are automatically selected for restore.

Macintosh: Cure for Jumpy Pointer (8/93)

Revised: 8/19/93
Security: Everyone

Macintosh: Cure for Jumpy Pointer (8/93)

==========

Article Created: 16 August 1993

TOPIC -----

My mouse pointer jumps all over the screen now, but it used to glide smoothly. What happened?

DISCUSSION -----

A jumpy mouse pointer probably means you have a loose ADB cable (the one that connects your mouse to your keyboard or your keyboard to your Macintosh). To check it:

1) Shut down.

2) Turn the power off.

3) Secure the cable's connections.

If this doesn't help, you may be victim of a prank extension that intentionally makes the mouse jump around. Check in the Extensions folder for extensions you don't recognize or don't need, throw them in the trash, and restart your computer.

Macintosh: If It Crashes or Hangs While Saving (4/94)

Revised: 4/8/94
Security: Everyone

Macintosh: If It Crashes or Hangs While Saving (4/94)

==========

Article Created: 16 August 1993
Article Reviewed/Updated: 8 April 1994

TOPIC ----------

I get error messages when I try to save files to my hard drive. What's the problem?

DISCUSSION ----------

If your computer crashes or hangs while saving, chances are you have a conflict with an extension or Control Panel. In this case, you should try removing non-Apple additions to your extensions folder or Control Panels as the first step towards resolving the problem.

However, crashes specifically when saving may also indicate that:

• The disk you are trying to save to is damaged

• The application you are using has been corrupted

In any of these cases, first try saving to another diskette before attempting to troubleshoot your problem.

If the Macintosh offers you a Continue button, click it and select Save As from the File menu. Save the file to a different disk, preferrably a floppy. If you do not get a Continue button, there are two ways to escape:

1) Try a force-quit by pressing the Command, Option, and Escape buttons on your keyboard simultaneously to quit the application you're in. You won't be able to save open documents, however.

2) Press the reset button on the programmer's switch on the side or back of the computer. The button is marked with a left-pointing triangle.

• If you suspect that the disk is damaged, try running Disk First Aid (on the

Utilities disk included with your computer). If it cannot be repaired by the utility software, you may need service.

- If you suspect that the application you are using has become corrupted, reinstall the application from the master disks.

Performa: Saving Data When the System Hangs (8/93)

Revised: 9/20/93
Security: Everyone

Performa: Saving Data When the System "Hangs" (8/93)

==========

Article Created: 16 August 1993
Article Reviewed/Updated: 16 September 1993

TOPIC ----------

My Performa 450 just stopped. The screen looks normal, but I can't move the pointer. I checked the ADB connection between the mouse, the keyboard, and the computer. Now I'm afraid I'll lose what I was working on.

DISCUSSION ----------

If there is no problem with your mouse or keyboard, you are probably experiencing a system "hang" or "freeze-up." It's a kind of quiet crash that doesn't provide you a failure notification or an error message.

There is a chance that your Performa is still able to communicate with the keyboard. Press Command-S to try to save what you were working on. Quit the application by pressing the Option, Command, and Shift keys simultaneously to quit the application you are in.

Then restart either by pressing the restart button on the side or back of your Performa (marked with a triangle), or by turning your Performa off, then on again. In either case, you will probably lose any information or documents you have not saved yet.

Unless you were in the process of saving a document when the system hung, the portions of what you were working on that you saved are safe. If you were saving when it happened, there is a good chance that the save was not successful and you will lose everything since the previous save.

Crashes or hangs while saving may indicate that:

1) the disk you are trying to save to is damaged; or

2) the application you are using has been corrupted (If you determine that this is the case, try reinstalling the software from the master disks);

3) the application is buggy or incompatible with the system software on your Macintosh.

In any of these cases, first try saving to another disk before attempting to troubleshoot your problem.

Revised: 8/30/93
Security: Everyone

Retrospect A/UX: Troubleshooting & Support (8/93)

==========

Article Created: 16 August 1993

TOPIC ----------

This article gives an overview of how to solve problems when using Retrospect A/UX with the Apple Workgroup Server 95.

DISCUSSION ----------

Always try to isolate the problem area as much as possible so that you can refer to the proper documentation. Don't forget to check for any "Read Me" files provided with your server product package. These files describe last-minute changes or information. For answers to commonly asked questions about Retrospect as well as error message explanations, search the Tech Info Library by "Retrospect: Error" for a listing of articles.

Memory or Disk Space Problems

Problems can occur with Retrospect and the A/UX operating system itself when available memory or free disk space are exhausted. If you suspect that this is the cause, take steps to correct the problem and try again.

It is important that Retrospect's application size be set large enough to complete the desired operations. See the memory size table below for a listing of appropriate memory settings for both backups and restores.

A/UX may show symptoms when free disk space drops below 10 percent of the total device capacity. Extensive disk operations performed with little disk space may also increase fragmentation of data, permanently reducing server performance. Additionally, printer spooling may be affected.

It's always worth trying the backup or restore again. Because backup and entire disk restores work incrementally, they will automatically resume where they left off when restarted.

Memory Size Table

Increase the memory you have allocated to Retrospect by using the Get Info command from the File menu in the Finder. The following is a guide for how much memory Retrospect will need to back up large volumes:

1,700K for 3,500 files/folders (this is the default)
4,000K for 10,000 files/folders
6,000K for 20,000 files/folders
8,000K for 32,000 files/folders

If you are backing up volumes that contain a large number of files, you may need more than the recommended amount of memory.

Damaged A/UX Installations

Proper A/UX operation depends on the behavior of a large number of files stored in specific locations within the directory hierarchy. Improper modifications to A/UX configuration files can cause file problems within the A/UX environment. If you suspect that important files have been corrupted, you should consider reinstalling A/UX and/or restoring from a backup.

Technical Support

Technical support for this version of Retrospect is provided only by Apple Computer, Inc. If you require assistance, please contact Apple Computer at 1-800-SOS-APPL. Outside the United States, please contact your local authorized Apple Service Provider.

Retrospect: Backing Up Multiple Volumes to Same Tape (8/93)

==========

Article Created: 17 August 1993

TOPIC --------------------

How do I back up multiple volumes to the same tape using Retrospect?

DISCUSSION --------------------

Retrospect allows you to do this automatically. Just select each volume you want to back up in the Volume Selection window. You may select a range of volumes using the Shift key, or make a non-contiguous selection using the Command key.

When you execute the backup, Retrospect will back up each of the selected volumes, one after another.

Retrospect: If It Won't Use Inserted Tape (8/93)

Revised: 9/3/93
Security: Everyone

Retrospect: If It Won't Use Inserted Tape (8/93)

==========

Article Created: 17 August 1993

TOPIC -----

Why won't Retrospect use the tape I have inserted?

DISCUSSION -----

Retrospect has a system for recognizing tapes and for adding tapes to a StorageSet. If Retrospect is not using a tape that you think it should be using automatically, one of the following situations typically applies:

- You are not inserting the tape Retrospect requires.

  Check that the name of the tape you are inserting matches the name Retrospect is requesting. If the name is the same and Retrospect does not proceed with the backup when you insert the tape, you probably have two tapes with the same name and are inserting the wrong one.

- Retrospect requires a new tape.

  Insert the tape you want Retrospect to use, wait for the tape to appear in the window, and then click Proceed. Retrospect will not use a tape that is part of a known StorageSet. It will automatically use any tape that is erased or correctly named.

- Retrospect cannot communicate with your tape drive.

  If a message says that no SCSI tape devices are visible, see the question "Why is my tape drive not showing up in Retrospect's Tape Devices window?" on page 171 of the Retrospect User's Guide.

Retrospect: What is a StorageSet Catalog (8/93)

Revised: 9/2/93
Security: Everyone

Retrospect: What is a StorageSet Catalog (8/93)

==========

Article Created: 17 August 1993

TOPIC --------------------

What is a Retrospect StorageSet Catalog and why do I need it?

DISCUSSION --------------------

A Catalog keeps track of which files are stored on the StorageSet, and where these files are located on the media. Do not delete the Catalog file. The Catalog is required to retrieve files from a StorageSet or make subsequent backups to it. If you lose a Catalog accidentally, you can rebuild it from your backup media. See "Recreating a Catalog" on page 163 for details. Rebuilding a Catalog may take several hours if you have a large amount of data.

At Ease 1.0: Setting Up (8/95)

Revised: 8/8/95
Security: Everyone

At Ease 1.0: Setting Up (8/95)

==========

Article Created: 17 August 1993
Article Reviewed/Updated: 08 August 1995

TOPIC ----------

This article discusses how to get started with At Ease, including turning it on, adding applications, and setting up documents.

DISCUSSION ----------

At Ease is designed for new users of the Macintosh and for children. It makes using the computer easier by making the applications and documents you use often more accessible. All the changes you make in the At Ease Setup box will take effect after you restart your Performa.

Turning On At Ease
---

1) Choose Control Panels from the Apple menu.

2) Double-click on the At Ease Setup icon.

3) Click the button marked On.

Adding Applications to At Ease
---

1) Click Select Items in the At Ease Setup window.

2) Click Gather Applications.

3) Click Add in the dialog box that appears.

4) Click on the items you don't want available in At Ease, then click Remove.

Setting Up Documents

You can control how other people can save their documents when using At Ease. You can decide whether each saved document will become a button in the At Ease Documents folder, or whether the user will have to save the document to a floppy disk.

To adjust these controls:

1) Click Set Up Documents in the At Ease Setup box.

2) Click your preference for saving: "Add a button to At Ease" or "Require a floppy disk."

Setting a Password

If you set a password, anyone who uses your Performa will need to know it to have access to anything that's not in At Ease, such as the Finder or the Performa's control panels. You don't have to set a password, but its a good idea if children will be using the computer.

To set a password:

1) Click Set Password in the At Ease Setup box.

2) Fill out the Set Password dialog box.

Macintosh: Troubleshooting a Rejected Disk (9/95)

Revised: 9/14/95
Security: Everyone

Macintosh: Troubleshooting a Rejected Disk (9/95)

==========

Article Created: 17 August 1993
Article Reviewed/Updated: 14 September 1995

TOPIC ----------

I keep getting a message saying, "This is not a Macintosh disk: Do you want to initialize it?" or "This disk is damaged: Do you want to initialize it?"I know the disk had already been formatted for a Macintosh and I have not had problems with it before. What is wrong now?

DISCUSSION ----------

When you get these messages and you are certain the disk is properly formatted, click No. If you click Yes, all the data on the disk is overwritten by the Macintosh and lost.

Immediately lock the disk. This protects your data in case the problem is a damaged directory or misaligned drive; both of these problems can cause your data to be erased from an unlocked disk.

What to Look For
==========

If you are using a Macintosh Quadra 660AV or Quadra 840AV, your disks could be rejected because these models use a different floppy disk controller which reads and writes data more precisely than the one in most other Macintosh computers. It may not be able to read your disk, especially if it was manufactured by a mass-duplication process. If this occurs with software installation floppy disks, contact the vendor for another copy of the software.

NOTE: This problem can occur if composite SIMMs are installed in your machine. Confirm that any additional RAM added is non-composite. Apple only supports non-composite SIMMs. If you are not sure whether you have composite SIMMs, read the Technical Information Library article titled, "Composite SIMMs: How to Identify."

1.4 MB High-Density Disks

If the disk is a 1.4 MB high-density disk and the drive can only read 400K or 800K disks (Macintosh computers before and including the Macintosh Plus, the original Macintosh II models, and some Macintosh SE models), it cannot be read by anything other than a SuperDrive (FDHD, or floppy drive, high density).

High-Density Disks

If the disk is a high-density disk that was formatted as an 800K disk, your drive gives you a message like "This disk is improperly formatted for this drive. Do you want to initialize it?"

The best option in this case is to remove the disk and reinsert it in an 800K drive. However, if no 800K drive is available, you can trick the drive by putting tape over the hole in the upper-left corner of the disk (be sure to cover both sides of the hole).

Save any information you need from the disk onto the hard drive, eject the disk, remove the tape, and reformat the disk as soon as possible.

NOTE: Use this technique only for emergencies.

Putting tape or any other item that could come off in the floppy drive can damage your computer.

Try the disk in another drive

If it works properly, this may indicate that one of the drives is misaligned or broken. When a disk that was written on by one drive cannot be read by another, the heads on one of the drives is out of alignment. The drive that is misaligned or broken may not be the drive that cannot read the disk; try the disk in three or four drives to identify the drive with the problem.

Warm or Cold Disks

If the disk is too warm or too cold, the drive may not be able to read it properly.

You can warm up a cold disk safely by setting it on top of your monitor for a few minutes. An overly warm disk can be cooled by placing it in a shady, cool place. DO NOT attempt to heat or cool a disk in an oven or refrigerator.

Damaged Disks

If none of these resolves or identifies the problem, the disk is damaged. You can attempt to make a copy of unreadable or damaged disks using a disk recovery software program (like MacTools FastCopy by Central Point Software), then try fixing the problem using a repair utility.

The first utility to try would be Disk First Aid which is included on one of the System disks (Utilities or Disk Tools) that came with your Macintosh computer. If it does not completely repair the problem, try running Disk First Aid several

times. If Disk First Aid cannot fix the problem, there are many other recovery utilities you can try.

Other repair or recovery utilities may do more complex repairs than Disk First Aid. You might try one of these utilities for severely damaged disks. You might at least be able recover some of your data. Some examples of these utilities include Norton Utilities by Symantec or MacTools Deluxe by Central Point Software.

Other Disk Formats

If you are using MS-DOS or ProDOS formatted disks, you must have the PC Exchange control panel installed and have a High-Density drive installed in your Macintosh computer. While your macintosh computer can read both ProDOS and MS-DOS disks, you should still use only Macintosh formatted disks if you are not exchanging files between Apple II or MS-DOS computers.

There is an additional step you may have to perform if you are using MS-DOS or ProDOS formatted floppies. You may have to throw away the PC Exchange Preferences file. It is located in the Preferences folder within the System Folder. If this file has become damaged, you may no longer be able to mount MS-DOS and ProDOS formatted disks. Once you have removed the PC Exchange Preferences file, a new one is created the next time you start your computer.

Retrospect: Managing Large Catalog Files (8/93)

Revised: 9/3/93
Security: Everyone

Retrospect: Managing Large Catalog Files (8/93)

==========

Article Created: 17 August 1993

TOPIC --------------------

What's the best way to manage large Retrospect catalog files?

DISCUSSION --------------------

Catalogs typically contain about 170K for each one thousand files that you back up. Keep Catalogs that you use regularly on your hard disk. If you do not have room on your hard disk, here are several options:

- Compress the Catalogs.
  Catalog compression is only available for Catalogs created with Retrospect 2.0 or later.

  To turn Catalog compression on, click the Configure icon in the Retrospect Directory, then click Catalog. Select the StorageSet and click OK. Then click the Compression button and choose the compression option you want.

- Store infrequently used Catalogs on a file server.

- Archive old Catalogs to their own StorageSet.

Retrospect: Streaming Tape Capacities Explained (6/96)

==========

Article Created: 17 August 1993
Article Reviewed/Updated: 5 June 1996

TOPIC ----------

This article answers the question, "Why do my tapes fill up sooner than expected?"

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for its content. Please contact the vendor for additional information.

DISCUSSION ----------

Dantz Tech Note No. 19

Streaming Tape Capacities Explained

Description

People often call us and ask "Why do my tapes fill up sooner than expected?" This technical note explains why.

Unlike 'block addressable' devices such as hard drives, cartridge drives, and some DC2000 tape drives, 'streaming' tape drives, such as DAT and 8mm drives, format the tape as they write to it, so the capacity varies, sometimes dramatically. Here are the five factors that influence streaming tape drive capacity:

1) Tape Condition

Streaming tape drives automatically verify data by reading each 'frame' of data immediately after writing it. If the data does not verify, the tape drive moves to the next part of the tape and attempts to write the frame again. As long as the drive successfully writes the data before trying too many times, it will not report a media failure and the backup will continue. This 'error rewrite'

process, which can be caused by dirty heads on the tape drive, deteriorating media, temperature changes, or a host of other issues, reduces tape capacity invisibly to Retrospect or the user.

2) Media Failure

Retrospect writes to a streaming tape until the tape drive reports that it has reached the end of the tape or that it has encountered a media failure. Then Retrospect logs the media failure, if appropriate, and requests a new tape to continue the backup. So if a tape drive is not achieving expected capacity, the first step should be to look in the log to see if any media failures are reported. (See Dantz Technical Note #12 "Media Failures".)

3) Speed of the Source

The speed of the source volume is the single most important factor in determining streaming tape capacity. Each time the buffer in the drive runs out of data to copy, an "underrun" occurs and the drive goes through a process that uses up raw tape capacity. The more underruns, the greater the reduction in capacity.

A fast SCSI hard disk on the same SCSI bus as the backup drive will tend to result in fewer underruns and therefore allow the tape to hold more user data. Copying files over a network tends to be slower, resulting in more underruns and lower capacities, especially if that network is LocalTalk speed.

The size of files being copied has a dramatic influence on the source speed. The same Macintosh and hard disk may take four times as long to transfer 100 MB of small files as it does to transfer a few large ones also totaling 100 MB. CPU speed matters, too. A faster Macintosh may transfer files at twice the rate of a slower one, even though the hard disk and file sizes are the same.

4) Hardware Compression

In order to boost capacity and speed, many streaming tape drives contain a chip to compress the data coming into the drive before it is written to tape. The amount of extra capacity achieved, if any, is dependent upon how well the incoming data compresses, and this varies widely. Here, from best to worst, is a listing of approximate file compressibility: database, text, spreadsheet, graphics, applications, System files, previously compressed files. Some files will reduce to 25% of their original size while some will not diminish in size at all.

It is impossible to know how much compression will be achieved until the data is actually copied to the tape drive. For display purposes, Retrospect assumes that using hardware compression doubles capacity, which is somewhat optimistic. A 50% increase in capacity is a good and more conservative rule of thumb. However, we must emphasize the broad variation that makes any prediction suspect.

5) Tape Length

With a given tape format, a longer tape will achieve proportionally higher capacity. For example, most DDS DAT drives support both 60 and 90 meter tapes.

Inadvertently using a 60 meter tape reduces capacity by approximately one third. DDS-2 DAT drives require specially formulated 120 meter tapes in order to write in their new format. Shorter tapes use the less dense DDS format causing an even more dramatic reduction in capacity.

Capacity Display

Retrospect displays an estimate of tape capacity to aid in managing the backup. Because DAT drives usually do not tell Retrospect what size of tape is inserted in them, and for all the reasons discussed above, Retrospect's assumptions of tape capacity may be inaccurate. Experience may indicate a more accurate number, at which time the capacity display may be changed by clicking the Set Capacity button in Configure:Catalogs. Note: no matter what tape capacity is displayed, Retrospect continues to write to the very end of the tape unless a media failure occurs.

Raw Capacity

We have performed extensive testing of DAT drives, and our experience is summarized in the following table. Note that these are typical ranges, and that it is perfectly normal, and expected, that any particular experience may be outside these ranges in either direction.

DDS DAT Drive Capacity (no compression)

Backup Source • Capacity (60 meter tape) • Capacity (90 meter tape)

600 MB Local SCSI Hard Disk • 900 to 1250 MB • 1350 to 1850 MB
AppleShare server over LocalTalk • 600 to 900 MB • 900 to 1350 MB
Retrospect Remote over LocalTalk • 600 to 1000 MB • 900 to 1500 MB
Retrospect Remote over EtherTalk • 800 to 1100 MB • 1200 to 1600 MB

DDS-2 DAT Drive Capacity (no compression)

Backup Source • Capacity (120 meter tape)

600 MB Local SCSI Hard Disk • 3000 to 3700 MB
AppleShare server over LocalTalk • 2800 to 3300 MB
Retrospect Remote over LocalTalk • 2800 to 3400 MB
Retrospect Remote over EtherTalk • 2900 to 3600 MB

These capacities will be increased by the amount of compression achieved, with the following caveat: if the source data compresses well, more of it is required in any given period of time. Therefore, the effective speed of the drive goes up and more underruns can occur, tending to reduce capacity.

Summary: Nominal vs. Actual

Tape drive manufacturers must provide a nominal capacity for the tape drives they sell. Yet there is no single accurate number for all users because so many

factors influence drive capacity. Typically, drive manufacturers will choose the highest number that is reasonably achievable under some conditions: large, compressible files on a fast drive.

While it may not be possible to come up with a single capacity figure for everyone, we do know that all users with a correctly operating and configured streaming tape drive will achieve some of the most economical storage available.

Retrospect: If Tape Drive Not Visible in Devices Window 8/93

Revised: 9/3/93
Security: Everyone

Retrospect: If Tape Drive Not Visible in Devices Window 8/93

==========

Article Created: 17 August 1993

TOPIC ----------

Why is my tape drive not showing up in Retrospect's Tape Devices window?

DISCUSSION ----------

To troubleshoot the problem:

1) Be sure the tape drive is turned on and properly connected and terminated.

2) Be sure the tape drive has a unique SCSI ID number.

If the drive still does not appear in the Tape Devices window, check the SCSI status. See "Checking SCSI addresses" on page 156 of the Retrospect User's Guide for details. If a "driver" appears installed for your tape drive, some other software has loaded itself inappropriately. Try running with fewer extensions to determine which extension is preventing Retrospect from accessing your tape drive.

Retrospect may be set to ignore the SCSI address your tape drive is set to. See "Checking SCSI addresses" on page 156 of the Retrospect User's Guide for details.

If you have a new type of tape drive, the tape drive may not be supported by the version of Retrospect you are using. To find out if a newer version of Retrospect is required for this tape drive, contact Technical Support and describe what information appeared in the SCSI Status dialog box for this drive.

For further information on working with Retrospect and Retrospect A/UX, search the Tech Info Library by "Retrospect" or "Remote."

LaserWriter: Different Helvetica Fonts (8/93)

Revised: 8/17/93
Security: Everyone

LaserWriter: Different Helvetica Fonts (8/93)

==========

Article Created: 16 August 1993

TOPIC --------------------

When I print documents with Helvetica fonts, a few characters (such as the paragraph mark, bullet, and vertical bar) print differently on a LaserWriter IINTX than on a LaserWriter Pro 630.

Why does this occur?

DISCUSSION --------------------

There are slight differences in how the Helvetica fonts are printed on the LaserWriter IIf and IIg and LaserWriter Pro family as compared the earlier LaserWriter printers such as the LaserWriter IINTX. The LaserWriter IINTX has version '001.002' of the Helvetica PostScript font while the LaserWriter IIf/IIg and LaserWriter Pro family have version '001.006S'.

Adobe has changed how their Helvetica PostScript fonts print. They made these changes to bring their fonts more in line with the actual fonts they license from the various font foundries.

Note that if you download the Helvetica font from the Adobe Type Library CD (version 001.006) to a LaserWriter IINTX, the printed documents will be similar to those from the LaserWriter IIf and IIg and LaserWriter Pro family.

If you want to use the older version of Helvetica, we recommend you contact Adobe and find out if the Helvetica version '001.002' is still available. You can download the this version to the LaserWriter Pro family or the LaserWriter IIf and IIg; the characters will print the same as those from the LaserWriter IINTX.

Adding an Application to the Launcher (7/95)

Revised: 7/19/95
Security: Everyone

Adding an Application to the Launcher (7/95)

==========

Article Created: 17 August 1993
Article Reviewed/Updated: 19 July 1995

TOPIC ----------

This article describes how to add new programs to the Launcher.

DISCUSSION ----------

Launcher Version 2.7 (included with System 7.5 Update 1.0)

Simply drag the icon of the application you want to add to the Launcher window. To create new Launcher folders, follow these steps:

Step 1
Open the Launcher Items folder (in the System Folder).

Step 2
Create a new folder.

Step 3
Rename the new folder. The fist character of the name MUST be a bullet (Option-8) followed by the name you want to call the folder.

Previous Launcher Versions

Step 1
Insert the disk that has the application on it in the floppy drive. If there is a disk labeled Installer, put it in the floppy drive instead of the application (or program) disk.

Step 2
Double-click on the Installer icon and follow the instructions on the screen. If there is no Installer, follow the instructions in the software’s installation manual.

Step 3
When installation is complete, find the application on your hard disk. It is not in the same Applications folder that holds the applications that came with your system. It is probably in a folder with the same name as the application.

Step 4
Click once on the program icon and select Make Alias from the File menu.

Step 5
An alias of the program appears on your screen next to the original item.

Step 6
Open the System Folder on your hard drive and drag this new alias into the Launcher Items folder to add it. The new item then appears in the Launcher.

This article was published in the "Information Alley":
Volume II, Issue 5, Page 12

Article Change History:
19 Jul 1995 - Retitled, added System 7.5 steps, added Info Alley information.
10 May 1995 - Added step 6 and revised step 5.

Performa: Switching Between Finder and At Ease (8/95)

==========

Article Created: 17 August 1993
Article Reviewed/Updated: 14 August 1995

TOPIC -----

How can I switch quickly between the Finder and At Ease?

DISCUSSION -----

To easily switch between At Ease and the Finder, you can use the Go To commands under the File menu, or create a Finder button in At Ease.

To create a Finder button:

1) Open the System folder.

2) Click once on the Finder Icon.

3) Select Make Alias from the File menu.

4) Drag the Finder alias into the At Ease Items folder.

This creates a Finder button on the At Ease desktop to switch you instantly to the Finder. However, when you switch to the Finder, aliases continue to be made for your documents in At Ease.

Performa: Finder and At Ease Compared (8/93)

==========

Article created: 17 August 1993

TOPIC -----

This article explains the difference between At Ease and the Finder.

DISCUSSION -----

The Finder is the basic program that all Macintosh computers use to generate "the desktop." When you are "in" the Finder, the desktop is what you see. Commonly, the Macintosh hard drive icon appears in the upper-right corner of the Finder screen. Any floppy disk you insert is represented by an icon that appears on the desktop, below the hard drive's icon.

At Ease is an application program that runs "on top of" the Finder to make the Performa easier to use. With At Ease on, applications appear in an application folder on the screen, and documents are represented as buttons in a Documents folder. There is no trash can, so nothing can be thrown away.

How Can I Tell whether I'm in At Ease or in the Finder?

Open the File menu.
- If you see Go To At Ease, you're in the Finder.
- If you see Go To the Finder, you're in At Ease.

In both the Finder and At Ease, a menu bar runs along the top of the screen, enabling you to perform certain tasks. The menu bar almost always displays an Apple menu and a File menu on the left.

The menu at the far right end of the menu bar is represented by:
- a small picture of a Macintosh, if you're in the Finder, or
- a little Macintosh next to a larger one in At Ease.

At Ease: Turning Off, Bypassing, Removing (8/95)

==========

Article Created: 17 August 1993
Article Reviewed/Updated: 14 August 1995

TOPIC ----------

How do I turn off, bypass, or remove At Ease?

DISCUSSION ----------

To turn off At Ease
==========

Step 1

Select Control Panels in the Apple menu.

Step 2

Double-click At Ease Setup.

Step 3

Click the Off button.

To Bypass At Ease
==========
To bypass At Ease on startup, hold the shift key down as you turn on the Performa.

To Remove At Ease Permanently:
==========

Step 1

Select Control Panels from the Apple menu.

Step 2

Double-click At Ease Setup.

Step 3

Click the Off button.

Step 4

Select Find from the File menu.

Step 5

Click More Choices, and check the box marked all at once.

Step 6

Click the arrows on the first two boxes until they say Name and Contains. Type At Ease in the third box. Click Find.

Step 7

Click an hold on the first highlighted item you see and drag all of them to the trash. All of the items will be put in the trash.

Macintosh: Color Startup Icon (8/93)

Revised: 8/20/93
Security: Everyone

Macintosh: Color Startup Icon (8/93)

==========

Article Created: 18 August 1993

TOPIC ----------

I have a Quadra 700 running System 7.0.1 connected to a third party color monitor. When I turn the computer on, the Macintosh icon in the "Welcome to Macintosh" window appears in black and white instead of color.

I zapped the parameter RAM (random-access memory) and have changed the Monitors control panel from millions of colors to display 256 colors. When I restarted the Macintosh icon returned to color. Can you explain this?

DISCUSSION ----------

This behavior is probably due to the color settings being partially stored in PRAM (parameter RAM) and partially in the Finder Preferences file. Some color information may have been restored on the first restart after zapping PRAM but the settings for the startup screen need to be explicitly set by using the Monitors control panel. You essentially performed the procedure outlined below and were successful.

Start with the system running with color on and the startup icon appears in color. Reset PRAM by holding down the Command-Option-P-R keys during the startup process. The Welcome to Macintosh screen and all the desktop icons will appear in black and white only. Without doing anything else restart the system again. The Welcome to Macintosh screen will still be in black and white but the desktop icons will be in color again.

Open the Monitors control panel and change the color/gray scale settings to something else and then back again to the desired setting and restart. The Welcome to Macintosh screen should now appear in color.

Retrospect: Catalog Out Of Sync Error (8/93)

Revised: 9/2/93
Security: Everyone

Retrospect: Catalog Out Of Sync Error (8/93)

==========

Article Created: 18 August 1993

TOPIC --------------------

What is the "Catalog out of sync" error message in Retrospect?

DISCUSSION --------------------

Each time Retrospect performs a backup to a StorageSet, it updates the information in the Catalog.

- A "Catalog out of sync" error indicates that Retrospect was unable to update the Catalog the last time it copied data to this StorageSet -- possibly because of equipment failure or power failure.

- This error may also be caused by a full disk error (error -34) or by an out of memory error (error -108). (Both of these errors are explained in separate articles in the Tech Info Library.)

What to do: Repair the Catalog. For instructions, see "Updating a Catalog" on page 162 of the Retrospect User's Guide. If updating the Catalog does not eliminate the "Catalog out of sync" error, the Catalog cannot be repaired. You have three options:

- Perform a Full Backup, resetting the Catalog and erasing the tape.

- Select Catalogs from the Configure icon. Choose the StorageSet and select Media Control. Click Skip, forcing Retrospect to use a new piece of media for the next backup.

- Create a new StorageSet and begin a new backup.

For further information on working with Retrospect and Retrospect A/UX, search the Tech Info Library by "Retrospect" or "Remote."

Retrospect: Bad StorageSet Header Error (8/93)

Revised: 9/2/93
Security: Everyone

Retrospect: Bad StorageSet Header Error (8/93)

==========

Article Created: 18 August 1993

TOPIC ----------

What is a "Bad StorageSet header" error in Retrospect?

DISCUSSION ----------

Each file in your StorageSet is preceded by a header that contains information such as its name and size. A bad StorageSet header error will appear if Retrospect reads a header that is obviously damaged or invalid.

What to do: If the error appears immediately while you are recreating a Catalog file, it means you forgot to tell Retrospect that the StorageSet was encrypted. If the error appears during backup or retrieving, it can indicate SCSI communication problems. See "SCSI problems" on page 180 of the Retrospect User's Guide for details.

Retrospect: Compare Error (8/93)

Revised: 8/18/93
Security: Everyone

Retrospect: Compare Error (8/93)

==========

Article Created: 18 August 1993

TOPIC ----------

What is a "Compare Error" in Retrospect?

DISCUSSION ----------

A compare error appears if a backup file does not match the file from which it was copied. Retrospect will try to back up the file again during the next backup session. The following messages in Retrospect Log indicate a compare error:

- File "Home": different modify date/time
- File "My File": didn’t compare at data offset 263,078
- File "My File": didn’t compare at resource offset 731,429

What to do: If you know the file was in use at the time the backup occurred, a compare error is usually nothing to worry about. It simply means the file changed between backup and verification. Compare Errors that mention data or resource offsets usually indicate SCSI communication problems. See "SCSI problems" on page 180 of the Retrospect User's Guide for details.

For further information on working with Retrospect and Retrospect A/UX, search the Tech Info Library by "Retrospect" or "Remote."

Retrospect: Error 34 (volume full) 8/93

==========

Article Created: 18 August 1993

TOPIC ----------

What is an "Error 34 (volume full)" error in Retrospect?

DISCUSSION ----------

Error 34 (volume full) means that a volume has run out of free storage space. You will see this error in the following situations:

- If you are restoring more files to a volume than will fit.

  Solution: Try restoring fewer files, or restore to a larger volume.

- When Retrospect is updating a StorageSet Catalog during a backup and the volume where the Catalog is located runs out of room.

  Solution: Check your hard disk to see if it is full, or close to full.

- If you are backing up to a Macintosh File StorageSet and the destination volume runs out of free space.

  Solution: Check the hard disk containing the Catalog file, to see if it is full.

Retrospect: Error -35 & Error -53 (8/93)

Revised: 8/31/93
Security: Everyone

Retrospect: Error -35 & Error -53 (8/93)

==========

Article Created: 18 August 1993

TOPIC --------------------

What do the following Retrospect errors mean?
• Error -35 (volume doesn't exist)
• Error -53 (volume off-line)

DISCUSSION --------------------

The Errors -35 and -53 (volume doesn't exist, volume off-line) mean that Retrospect cannot find a volume when it is time to perform a backup.

What to do: Make sure the volume is actually connected to the Macintosh and that it is mounted on the Desktop. If it is, click the Immediate icon in the Retrospect Directory, then click View to scan the volume and display the Browser.

Macintosh Software Utility Update 1.0: Description (8/93)

Revised: 8/18/93
Security: Everyone

Macintosh Software Utility Update 1.0: Description (8/93)

==========

Article Created: 18 August 1993

TOPIC --------------------

The Macintosh Software Utility Update 1.0 disk is an update of Apple utilities shipped with Macintosh computers running System 7.1. The Update includes MacCheck 1.0.4, Disk First Aid 7.2 and HD SC Setup 7.2.

DISCUSSION --------------------

This system update delivers a number of software enhancements to Macintosh users. Following are brief descriptions of the enhancements found in the Macintosh Software Utility Update 1.0.

The update consists of the following applications:

• Apple HD SC Setup version 7.2, which gives you more flexibility to format large Apple hard drives between 1 and 2 gigabytes.

• Apple Disk First Aid 7.2, a utility that repairs damaged drives. This version contains a brand-new user interface, which differs greatly from the last version Disk First Aid, 7.1.1.)

• MacCheck 1.0.4, a support utility that has previously been placed only on Performa and LC 520 computers at the factory.

- MacCheck creates a profile of your Macintosh computer, including:
  • The processor, memory, expansion cards, SCSI drives, keyboard, monitor, etc.
  • The installed applications and system software on your startup drive
- MacCheck performs a number of tests, including:
  • A general logic board test
  • File system and System files test
  • Duplicate System Folders test

Apple strongly recommends that Macintosh and Macintosh Performa owners update any previous copies of Disk First Aid, HD SC Setup and MacCheck to the versions included in Macintosh Software Utility Update 1.0 disk:

- For Macintosh owners: update your Disk Tools disk, which contains older versions of Disk First Aid and HD SC Setup.

- For Macintosh Performa owners update your Utilities disk, instead of "Disk Tools". The "Utilities" disk contains which contains older versions of Disk First Aid and HD SC Setup.

The Macintosh Software Utility Update 1.0 disk is available from 40 different online services, including AppleLink.

The AppleLink path is:
Software Sampler
 Apple SW Updates
  Macintosh
   Utilities

LaserWriter: Supported Network Protocols (8/93)

Revised: 8/18/93
Security: Everyone

LaserWriter: Supported Network Protocols (8/93)

==========

Article Created: 18 August 1993

TOPIC ----------

This article discusses which network protocols are supported by Apple LaserWriters.

DISCUSSION ----------

Apple LaserWriters only support the AppleTalk network protocol and do not directly support other network protocols, whether over LocalTalk or Ethernet.

If you wish to send data from another network protocol to a LaserWriter, you must convert it to the AppleTalk protocol with software or a hardware device.

Retrospect: Error -36 (I/O error) (2/95)

Revised: 2/27/95
Security: Everyone

Retrospect: Error -36 (I/O error) (2/95)

==========

Article Created: 18 August 1993
Article Reviewed/Updated: 27 February 1995

TOPIC ----------

What is an Error -36 (I/O error) in Retrospect?

DISCUSSION ----------

When an Error –36 (I/O error) is reported by Retrospect, a media problem has occurred on a source volume.

What to do: Try verifying the media on your source disk using a disk utility or the formatting program that came with your hard drive. If you are using an Apple hard disk, try using the Test command in the Apple HD SC Setup utility or MacCheck (MacCheck is included with Macintosh computers after July 1993, and on the Macintosh Software Utility Update 1.0 disk).

If you have a Power Macintosh with the native version of Retrospect 2.1i installed, and while Retrospect displays a dialog that says "Scanning...." you encounter this error, contact Dantz. The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

For further information on working with Retrospect and Retrospect A/UX, search the Tech Info Library by "Retrospect" or "Remote."

Article Change History:
27 Feb 1995 - Added Power Macintosh and scanning.

Retrospect: Error –54 (file busy/locked) (8/93)

==========

Article Created: 18 August 1993

TOPIC --------------------

What is "Error –54 (file busy/locked)" in Retrospect?

DISCUSSION --------------------

There are two causes for Error –54 (file busy/locked):

- You are trying to back up System files using System 7 file sharing or AppleShare.
- Another application, such as FileMaker or 4th Dimension, had the files open, preventing Retrospect from accessing them.

What to do: Back up the busy files from the local Macintosh, quit the application that owns the busy file, or install Retrospect Remote and back up the files.

Retrospect: Error 102 (trouble communicating) (8/93)

Revised: 8/31/93
Security: Everyone

Retrospect: Error 102 (trouble communicating) (8/93)

==========

Article Created: 18 August 1993

TOPIC --------------------

What is "Error 102 (trouble communicating)" in Retrospect?

DISCUSSION --------------------

Error 102 (trouble communicating) occurs when the Macintosh loses contact with the backup device. The most common cause is improper SCSI termination.

What to do: Refer to the following information on SCSI problems below:

Troubleshooting SCSI Problems

If the Macintosh SCSI chain is not set up properly, communication errors may occur that can cause data corruption or system failures during backup operations. This following information is designed to give you guidance when encountering SCSI problems.

Some devices such as scanners, CD-ROM drives, or external SCSI floppy drives can cause problems on the SCSI bus, especially if they are turned off. If you are experiencing SCSI communication problems, make sure that all of your SCSI devices are powered ON when you start your Macintosh.

The following sample errors can indicate communication errors on the SCSI bus:

• File "Home" didn’t compare at resource offset 10,750

• File "Tech Note" didn’t compare at data offset 3,253

• Trouble writing: "1-Office Backup 2" (0), error 102 (trouble communicating)

• Trouble reading: "1-Office Backup 2" (0), error 102 (trouble communicating)

The above errors can usually be traced to some failure in the SCSI

configuration, whether it is termination, a particular device, cabling, or device order. The most common cause of communication problems is improper termination or bad SCSI cables.

Termination

The general rule for termination is to have only two terminators on the SCSI bus, one at the beginning and one at the end. If you have only a single device on the SCSI bus, then only one terminator is needed. Most Macintosh computers purchased with internal hard disks are internally terminated. Some SCSI peripherals come with internal termination built-in, and must be placed at the end of a SCSI chain.

For more information, refer to your Macintosh user's guide and the manual that came with your hardware device.

SCSI Cables

Communication problems can be caused by bad or loose-fitting SCSI cables. Check all cables for proper seating in each connector. The entire length of your SCSI bus should not exceed 20 feet. Whenever possible, avoid using cables over six feet in length.

Device Order and Device Conflicts

To avoid problems caused by device order or device conflicts, make sure that each device has a unique SCSI address. If problems occur, try changing the order of SCSI devices or temporarily removing unneeded devices.

Macintosh: Multiple Monitors via NuBus Expander (8/93)

Revised: 8/19/93
Security: Everyone

Macintosh: Multiple Monitors via NuBus Expander (8/93)

==========

Article Created: 19 August 1993

TOPIC ----------

I want to connect multiple monitors to a Mac II or IIfx (via a NuBus expander) to give me as many NuBus slots as possible.

Is there is a limit to how many monitors that can be handled by:
a) the monitors control panel?
b) the Macintosh hardware?

DISCUSSION ----------

Using an 8 slot expansion chassis such as the one from Second Wave, Inc., you could connect up to 13 monitors to a Macintosh II or IIfx. That is, the expansion chassis uses one of the NuBus slots in the Macintosh, leaving 5 NuBus slots available in the Macintosh for video cards. The expansion chassis can house 8 cards. Second Wave informs us that video cards used in their expansion chassis must have 32-bit clean drivers. Video cards that are 24-bit will not work in the expansion chassis (but will in the Macintosh).

Second Wave's chassis is able to provide 130 watts and additional chassis' cannot be daisy chained off of the first chassis. They recommend you request, at no additional charge, the highest volume fan they distribute in their chassis for this application.

Apple has tested the connection of 6 monitors to a Macintosh and Second Wave has tested 13. It will vary from Macintosh-to-Macintosh slightly as the memory map and other managers varies somewhat. If you are able to connect a greater quantity of monitors to a Macintosh, please let us know.

The Pallet Manager could begin to have problems above 32 monitors unless you use a bit depth of 8 or less. The parameter RAM on a Macintosh II family machine only has support for 6 NuBus slots, and the VIA chips have specific interrupts for the six slots. Many of the issues that may arise depend on how the NuBus expansion chassis manufacturer handled the

technical issues surrounding the slot manager, parameter RAM, multiplexing multiple slots through one slot, and the VIA interrupts.

To locate a vendor's address and phone number, use the vendor's name as a search string.

Newton MessagePad: Scheduling Birthdays w/Assistant (8/93)

==========

Article Created: 19 August 1993

TOPIC --------------------

How can I schedule a birthday as a repeating appointment based on the information in my Newton MessagePad's Names file?

DISCUSSION --------------------

To schedule a birthday as a repeating appointment based on the information in your Newton's Names file, do the following:

In the Notepad, write "Birthday", followed by the person's name and their birth date, then tap Assist.

For instance, if Lisa is in your Names File and her birthday is 6/27, write "Birthday Lisa 6/27", then tap Assist.

This will fill out a schedule slip for an appointment with Lisa's name in the Who blank that repeats every year on 6/27. Also, an alarm will be set for 10 days prior to the birthday date.

Newton MessagePad: Changing Letter Styles

Revised: 8/19/93
Security: Everyone

Newton MessagePad: Changing Letter Styles

==========

Article Created: 19 August 1993

TOPIC -----

My lower case t's look like the plus symbol (+) when I write them on my Newton MessagePad. I would like to teach Newton to not recognize the plus symbol by selectimg Rarely in the Letter Styles Preferences Menu for that character.

When I click the Rarely button, it always goes back to Sometimes. Why is this?

DISCUSSION -----

There is only one choice for the plus symbol in the Letter Styles Preferences Menu. Whenever there is only one choice for a particular character or symbol in the Letter Styles Menu, you cannot set that choice to Rarely.

This was a design decision, since you have to be able to write each character in a form that Newton's recognizer can understand.

Retrospect: Error 108 (out of application memory) (8/93)

Revised: 8/31/93
Security: Everyone

Retrospect: Error 108 (out of application memory) (8/93)

==========

Article Created: 19 August 1993

TOPIC ----------

What is "Error 108 (out of application memory)" in Retrospect?

DISCUSSION ----------

Error 108 (out of application memory) means that Retrospect needs more memory.

What to do: Increase the memory you have allocated to Retrospect by using the Get Info command from the Finder's File menu. The following is a guide for how much memory Retrospect will need to back up large volumes:

1,700K for 3,500 files/folders (This is the default setting.)
4,000K for 10,000 files/folders
6,000K for 20,000 files/folders
8,000K for 32,000 files/folders

If you are backing up volumes that contain a large number of files, you may need more than the recommended amount of memory.

Security: Everyone

Retrospect: Error 203 (hardware failure) (8/93)

==========

Article Created: 19 August 1993

TOPIC --------------------

What is "Error 203 (hardware failure)" in Retrospect?

DISCUSSION --------------------

Error 203 (hardware failure) means that the tape drive is having problems because of a bad tape, a SCSI problem, or a mechanical error.

What to do:

- If the error only occurs when you use a particular tape, that tape is probably damaged. Try using a new tape.

- If the error occurs when you use any tape, you may have a problem with your SCSI chain or device. Try turning off the tape drive and computer for two minutes and then turning them back on again. See the Tech Info Library article "Retrospect: Troubleshooting SCSI Problems" for more information.

Retrospect: Troubleshooting SCSI Problems (8/93)

==========

Article Created: 19 August 1993

TOPIC ----------

This article describes how to troubleshoot SCSI problems when using Retrospect.

DISCUSSION ----------

SCSI Problems

If the Macintosh SCSI chain is not set up properly, communication errors may occur, when using Retrospect, that can cause data corruption or system failures during backup operations. This section is designed to give you guidance when encountering SCSI problems.

Some devices such as scanners, CD-ROM drives, or external SCSI floppy drives can cause problems on the SCSI bus, especially if they are turned off. If you are experiencing SCSI communication problems, make sure that all of your SCSI devices are turned on when you start your Macintosh.

The following sample errors can indicate communication errors on the SCSI bus:

• File "Home" didn't compare at resource offset 10,750

• File "Tech Note" didn’t compare at data offset 3,253

• Trouble writing: "1-Office Backup 2" (0), error 102 (trouble communicating)

• Trouble reading: "1-Office Backup 2" (0), error 102 (trouble communicating)

The above errors can usually be traced to some failure in the SCSI configuration, whether it is termination, a particular device, cabling, or device order. The most common cause of communication problems is improper termination or bad SCSI cables.

Termination

The general rule for termination is to have only two terminators on the SCSI bus, one at the beginning and one at the end. If you have only a single device on the SCSI bus, then only one terminator is needed. Most Macintosh computers purchased with internal hard disks are internally terminated. Some SCSI peripherals come with internal termination built-in, and must be placed at the end of a SCSI chain. For more information, refer to your Macintosh user's guide and the manual that came with your hardware device.

SCSI Cables

Communication problems can be caused by bad or loose-fitting SCSI cables. Check all cables for proper seating in each connector. The entire length of your SCSI bus should not exceed 20 feet. Whenever possible, avoid using cables over six feet in length.

Device Order and Device Conflicts

To avoid problems caused by device order or device conflicts, make sure that each device has a unique SCSI address. If problems occur, try changing the order of SCSI devices or temporarily removing unneeded devices.

Retrospect: Error 205 (lost access to storage media) (8/93)

Revised: 8/31/93
Security: Everyone

Retrospect: Error 205 (lost access to storage media) (8/93)

==========

Article Created: 19 August 1993

TOPIC ----------

What is "Error 205 (lost access to storage media)" in Retrospect?

DISCUSSION ----------

Retrospect Error 205 (lost access to storage media) usually indicates that the SCSI bus was reset during a backup, causing Retrospect to lose contact with the tape. Usually this error indicates a SCSI problem and may be accompanied by an Error 102 (trouble communicating).

What to do: If Error 102 accompanies Error 205, see the Tech Info Library article: "Retrospect: Troubleshooting SCSI problems".

If Error 102 does not accompany Error 205 and SCSI communication problems have been ruled out, the next step is to check for media failure on the source volume. Some hard disks reset the SCSI bus when they sense they are experiencing a media failure. Try testing the drive with the software that was originally used to format it.

Retrospect: Errors -24201 & -25040 (8/93)

Revised: 8/31/93
Security: Everyone

Retrospect: Errors -24201 & -25040 (8/93)

==========

Article Created: 19 August 1993

TOPIC ----------

What is the meaning of the following Retrospect errors?
-24201 (chunk checksum failed)
-25040 (Catalog invalid or damaged)

DISCUSSION ----------

Errors -24201 (chunk checksum failed) and -25040 (Catalog invalid or damaged) mean that a Catalog or other Retrospect 2.0 format file is corrupted.

What to do: If the error occurs when you are trying to back up to a particular StorageSet, you need to rebuild the Catalog for that StorageSet. After the recatalog, reselect this StorageSet in your scripts. If the error occurs when you launch Retrospect, the Retro.Configuration file may be corrupted. Remove this file from the Retrospect Preferences folder and launch Retrospect again. After you do this, you will need to recreate your scripts and other settings.

Alternatively, restore a previous copy of your Retro.Configuration file from one of your StorageSets.

Retrospect: Error –24062 (limited to 32000 files/folders)(8/93)

Revised: 9/2/93
Security: Everyone

Retrospect: Error –24062 (limited to 32000 files/folders)(8/93)

==========

Article Created: 19 August 1993

TOPIC --------------------

What is "Error -24062 (limited to 32000 files/folders)" in Retrospect?

DISCUSSION --------------------

This error occurs if you:
• try to back up a volume that contains more than 32,000 files and folders, or
• perform a search request which finds more than this number of items.

What to do: Partition your hard disk into two or more partitions, keeping less than 32,000 items in each partition. Or define each of the top level folders of the volume as a Subvolume.

Note: Dantz strongly recommends that you store fewer than 32,000 files on any single volume, both for Retrospect compatibility and because the Macintosh file system becomes less stable with this many files on a single volume.

Security: Everyone

Retrospect: Internal Consistency Check Error (8/93)

==========

Article Created: 19 August 1993

TOPIC --------------------

What is an "internal consistency check error" in Retrospect?

DISCUSSION --------------------

An internal consistency check error occurs if Retrospect experiences a major problem during operation not due to normal errors or circumstances.

When this happens, Retrospect creates an error log, in the Retrospect preferences folder, named "Retrospect.error.log.n" where n is a long number.

What to do: If you experience one of these errors, contact Dantz Technical Support and send us the error log along with a brief description of the circumstances surrounding the failure.

Software Utility Update 1.0 vs. HW System Update 2.0 (8/93)

Revised: 8/23/93
Security: Everyone

Software Utility Update 1.0 vs. HW System Update 2.0 (8/93)

==========

Article Created: 19 August 1993

TOPIC --------------------

What are differences between
• the Software Utility Update 1.0 Disk, and
• the Hardware System Update 2.0 Disk?

DISCUSSION --------------------

The Software Utility Update 1.0 introduces new Apple support utility program, MacCheck. It also includes a newer version of Disk First Aid (version 7.2) than is on the Hardware System Update 2.0 disk. The version of HD SC (version 7.2) included on the Software Utility Update 1.0 disk is identical to that on the Hardware System Update 2.0 disk.

The Hardware System Update 2.0 disk, in addition to HD SC Setup 7.2 and Disk First Aid 7.1.1, provides a set of system software enhancements that improve performance on selected Macintosh computers running System 7.1. (These enhancements are not intended for Performa computers.) The Software Utility Update 1.0 disk does not include the enhancements.

For additional information on the Hardware System Update 2.0 disk, search the Tech Info Library by the search string "Hardware System Update."

MacCheck: Operating Tips and Hints (8/93)

==========

Article Created: 19 August 1993

TOPIC -----

This article describes some operational tips and hints to consider when using MacCheck 1.0.4 and higher.

DISCUSSION -----

Software Bundles

A Software Bundle ID = xxx-xxxx message may appear at the bottom of the launch splash screen. The Software Bundle ID is a unique number that identifies what system software (7.0, 7.1, US, France, etc.), applications, or additional software was installed on the drive at the factory. MacCheck displays this information if the bundle information is detected during launch.

MacCheck running on a Performa

If MacCheck is running on a Macintosh Performa, it reports only that it is running on a Performa; it does not report the Performa model name.

Large Hard Disks

On large hard disks, the Gathering Miscellaneous Boot Volume Statistics section of the launch process often takes the most time, as MacCheck searches for bad file creation dates.

Dimmed Menus During Tests

While tests are running, the File and Help menus and Help, Test, and Quit buttons are dimmed (not available).

No Printer Selection

If no printer is selected or if no log is currently selected, the Print

and Page Setup menu items are dimmed (not available).

Status Bar Updates

When the file system test is in progress, the status bar is updated only after each volume has been checked. For large volumes, this may mean that the status bar is frozen for a minute or two.

MacCheck: Common Warnings Reported (8/93)

Revised: 8/23/93
Security: Everyone

MacCheck: Common Warnings Reported (8/93)

==========

Article Created: 19 August 1993

TOPIC ----------

This article describes the common warnings reported by MacCheck, as well as steps you can take to correct any problems.

DISCUSSION ----------

File System Test Reports Volume Is Busy

MacCheck should be the only application running while it performs the file system test. The results are not valid if other applications, extensions (including File Sharing), or Control Panels are running at the same time as MacCheck's file system test.

File System Test Can't Test This Kind of Volume

MacCheck only tests for file system and System file corruption on volumes that are not locked. In other words, MacCheck only tests volumes that you can repair. MacCheck considers CD-ROM drives and file server volumes locked.

Bad File Creation Dates

The "Additional Systems Info" log lists all files with bad creation file dates (a creation date later than the last modification date). This usually means that some time in the past the system clock was not set up correctly. This warning is not fatal, and since it is time consuming to reset file dates, you may not wish to repair these files. Apple's ResEdit application and some third-party applications allow you to reset file dates.

MacCheck Gives a Log Full Warning

You have too many files with bad creation dates, or too many aliases that are unresolved. For example, if you double-click on the alias, the Finder gives you a "Document/file cannot be found" error. MacCheck may not be able

to record all of the standard profile information into the Additional System Info log. If you have a large number of fonts or applications, MacCheck may not be able to record all of the application and font information in the "Application and Font Info" log.

MacCheck: Multiple System Folders Detected (8/93)

Revised: 8/23/93
Security: Everyone

MacCheck: Multiple System Folders Detected (8/93)

==========

Article Created: 19 August 1993

TOPIC ----------

I ran MacCheck on my Macintosh and it detected several System Folders. What should I do?

DISCUSSION ----------

MacCheck detects multiple System Folders and displays their pathname in the "Additional System Info" log.

Although you can safely store multiple System Folders on your drive, many problems can be traced to additional System Folders inadvertently placed on drives. Ignore the warning if you intend to have multiple System Folders; otherwise, Apple recommends only one System Folder per hard disk.

MacCheck: Directory Corruption Detected (8/93)

==========

Article Created: 19 August 1993

TOPIC ----------

MacCheck has detected Directory Corruption on my hard disk. What should I do?

DISCUSSION ----------

If MacCheck detects directory corruption during its file system test, locate the Disk First Aid program on your Utilities disk (Performa owners) or Disk Tools disk (Macintosh owners.)

Follow the procedure detailed below:

1) Shut down your Macintosh from the Finder's Special menu.

2) Insert your Utilities or Disk Tools disk and turn on your Macintosh.

3) When the Finder appears, run the Disk First Aid * program. (Note: Be careful to designate the drive that MacCheck detected the problem on, as the drive that needs to be fixed.

4) Choose Quit to return to the Finder and choose Restart from the Special menu to restart your Macintosh.

* Apple recommends Disk First Aid v7.2, found on the Software Utility Update 1.0 disk, available from AppleLink and other online services.

Occasionally, Disk First Aid versions prior to version 7.2 will not find or fix the problems that MacCheck has detected. If you run MacCheck after running Disk First Aid, MacCheck may still detect file system problems. If this occurs or if MacCheck tells you that it detected problems that Disk First Aid cannot fix, the problems can be corrected by reinitializing your hard drive using Apple HD SC Setup. Please make sure that you have backed up your drive (using Apple Backup if you are a

Performa user) before reinitializing your drive.

Some third-party utilities may be able to repair problems that Disk First Aid cannot repair. However, reinitializing your drive is the only way to be sure that problems that MacCheck detects are corrected.

MacCheck: System File Corruption Detected (8/93)

Revised: 8/23/93
Security: Everyone

MacCheck: System File Corruption Detected (8/93)

==========

Article Created: 19 August 1993

TOPIC ----------

MacCheck has detected System File Corruption on my hard disk. What should I do?

DISCUSSION ----------

Macintosh and Performa Users

If MacCheck detects corruption problems in your System, Finder, System Enabler, or Launcher (Performa) files, replace these files using your original Apple installation disks using the Apple installer.

Performa Users

- If you have backed up your Performa with Apple Backup, you can restore a backup of your System files with the Apple Restore program.

- If you have not created a backup of your system, please contact the Apple Assistance Center.

MacCheck: Logic Board Failure Detected (8/93)

Revised: 8/23/93
Security: Everyone

MacCheck: Logic Board Failure Detected (8/93)

==========

Article Created: 19 August 1993

TOPIC ----------

MacCheck just detected a logic board failure on my Macintosh. What should I do?

DISCUSSION ----------

If MacCheck detects a logic board failure:

1) Shut down your Macintosh by selecting Shut Down from the Finder's Special menu.

2) Hold down the Shift key while restarting your Macintosh. This lets the computer start up without loading any system extensions.

3) Run MacCheck again. If MacCheck still detects a logic board error, contact the Apple Assistance Center or your Authorized Apple Service Provider.

AppleShare 4.0 and Macintosh Computers Supported (8/93)

Revised: 8/19/93
Security: Everyone

AppleShare 4.0 and Macintosh Computers Supported (8/93)

==========

Article Created: 18 August 1993

TOPIC ----------

1) Is AppleShare 4.0 supported on a Quadra 900 and 950? I have conflicting information regarding the Quadra 950.

2) Also, will AppleShare 4.0 be supported on the new Centris 660AV, or Quadra 840AV?

DISCUSSION ----------

1) AppleShare 4.0 was tested on only four hardware platforms. These platforms are the Centris 610 (AWS 60), Quadra 700, Quadra 800 (AWS 80), and Quadra 950. As a result these are the only "officially supported" AppleShare 4.0 platforms.

   Given the similarity between the Centris 610 and 650, and the Quadra 900 and 950, it's quite likely that AppleShare 4.0 will run on those two platforms, but they are NOT SUPPORTED.

2) AppleShare 4.0 was not tested on the Centris 660AV and Quadra 840AV. The differences between the supported platforms (Centris 610, Quadra 700, Quadra 800, and Quadra 950) and the new Centris 660AV and Quadra 840AV platforms are greater than the two unsupported computers (Centris 650, and Quadra 900) mentioned above. The Centris 660AV and Quadra 840AV MAY, OR MAY NOT be tested in the future, but they are strongly NOT SUPPORTED with AppleShare 4.0.

Newton MessagePad: Changing Fonts in To Do List (8/93)

Revised: 8/20/93
Security: Everyone

Newton MessagePad: Changing Fonts in To Do List (8/93)

==========

Article Created: 20 August 1993

TOPIC -----

If I change the default font or style by opening the Styles icon in the Extras drawer, the font or style is changed everywhere except the To Do List. Why?

DISCUSSION -----

The Newton MessagePad's To Do List does not use the default font settings as chosen in Styles; it defaults to plain 12 point text. After you have entered text in the To Do List, you can select this text, and change its style by opening the Styles icon.

Macintosh: How to Copy a Floppy Disk (8/93)

Revised: 8/20/93
Security: Everyone

Macintosh: How to Copy a Floppy Disk (8/93)

==========

Article Created: 20 August 1993

TOPIC ----------

How do I copy a floppy disk?

DISCUSSION ----------

If your Macintosh has two floppy-disk drives:

1) Insert the disk to be copied in one drive, and the disk you want to copy to in the other drive.

2) Drag the icon of the original disk onto the icon of the "target" or destination disk.

3) You'll be asked if you want to completely replace the contents of the target disk with the contents of the original. Click Yes to continue.

   This will replace, not add to, everything that was on the disk you are copying to.

If your Macintosh has only one floppy-disk drive:

1) Insert the disk to be copied in the floppy disk drive.

2) Press Command-E to eject the disk. Its icon will remain on the desktop, but as a dimmed, or grayed-out shadow.

3) Put the disk you want the new copy on in the floppy disk drive. It may be a disk you have used before, or a new, uninitialized disk. If it is uninitialized, click Initialize.

4) Drag the icon of the dimmed floppy disk over the icon of the disk you just inserted in the drive.

5) You'll see a warning dialog box that asks if you want to completely replace the contents of the new disk with the contents of the original. Click Yes to continue. Note: This will replace, not add to, everything that was on the disk you are copying to.

6) You'll be asked to insert disks as needed as the computer makes your copy.

Note: You can stop the copying process at any point by pressing "Command-." (Command-period). You may have to press this key combination more than once.

MacCheck: Software Profiler Reports (8/93)

Revised: 8/23/93
Security: Everyone

MacCheck: Software Profiler Reports (8/93)

==========

Article Created: 19 August 1993

TOPIC ----------

This article details the information that MacCheck's software profiler collects and reports.

DISCUSSION ----------

The software profiler inside MacCheck collects and reports information on the following. (Note: state refers to active or inactive.)

- System version
- Finder version
- AppleTalk version, state, and (if Ethernet is installed), Phase 1 or 2.
- System Enablers
- Communications Toolbox (CTB) version, along with names and versions of any CTB tools installed.
- QuickDraw version
- Debugger name and version
- Memory Addressing mode (24-bit, 32-bit, or not capable of 32-bit mode)
- Virtual Memory state and location of the VM Backing Store file
- Disk Cache state and size
- User Name
- Machine Name

- Default AppleTalk Zone
- File Sharing state
- Chosen Printer
- Startup Device
- Volume (hard disk) information including: name, type, format, attributes, SCSI ID, Total Capacity, Free Space, Number of Files, Number of Folders, Last Backed Up, bootable, available for File Sharing, and has or should have boot blocks
- System Heap size
- Apple Menu Items: name and version of files.
- System Files: name, version & state for the following: System Extensions, Control Panels, Chooser Extensions, and Startup Items
- Fonts Installed: name, font family ID, type, sizes Installed, location
- Application Info: name, minimum memory required, preferred memory, 32-bit clean and location.
- Miscellaneous Startup (Boot) Volume Statistics:
  - Duplicate System Folders
  - Creation Date/Last Modified Date In The Future
  - Deepest Path
  - Longest Path

MacCheck: Volume & Directory File Reports (8/93)

Revised: 8/20/93
Security: Everyone

MacCheck: Volume & Directory File Reports (8/93)

==========

Article Created: 19 August 1993

TOPIC -----

This article details the information MacCheck's Volume & Directory File Checker reports.

DISCUSSION -----

HFS Directory Structure Checking:

- Volume checks
  - Every block allocated to a file on a volume is marked in the volume bitmap.
  - Every block not allocated to a file on a volume is not marked in the volume bitmap.
  - Every file on the volume has a unique set of blocks. No file claims blocks that are allocated to another file.

- Directory checks
  - Each directory has the same number of files and directories allocated to it that is claimed in the directory record.
  - The number of directories on the volume is the same as the number of directories found in the volume header.

- BTree checks
  - Each node in the catalog and extent trees has the proper valence.
  - Each node in the catalog and extent trees is properly marked in the volume bitmap.
  - Each node in the catalog and extent trees is referenced only once.

Resource File Checks:

The Resource File Check performs an analysis of the System files, testing for the following:

- The resource fork is at least the minimum size.

- There is no overlap or space between the header, the resource data list, and the resource map.
- There are no bytes between the End Of File (EOF) and the end of the resource map.
- Each record in the resource data list is used once and only once. The last data item ends exactly where the data list ends.
- Each item in the resource type list contains at least one reference; each sequence of referenced items starts where the previous resource type item's reference list ended; and each item in the reference list is pointed to by one and only one resource type list item.
- There are no duplicates in the resource type list.
- Each name in the name list has one and only one reference, and the last name doesn't point outside the name list.
- Each reference list item points to a valid data item and either has a name list offset of –1 or points to a valid name list offset.
- All names have a non-zero length.

MacCheck: Hardware Profiler Report (8/93)

Revised: 8/23/93
Security: Everyone

MacCheck: Hardware Profiler Report (8/93)

==========

Article Created: 20 August 1993

TOPIC -----

This article details what information the MacCheck's hardware profiler collects and reports.

DISCUSSION -----

Macintosh Hardware Attributes:

- Macintosh model and machine ID.
- Processor (CPU) and clock speed (in MHz)
- Co-processor (FPU)
- Memory manager (MMU)
- Physical memory size in MB
- Logical memory size in MB
- Battery status (Portables and PowerBooks only)
- Hardware attributes
- Keyboard type
- ROM size in K
- ROM version
- ROM sub-version (Macintosh IIci and above)
- ROM checksum
- Docking information for PowerBook Duo

NuBus cards:

- Slot number in hexadecimal
- Card name
- Board ID
- Board version

LC-compatible PDS slot (Reported under NuBus slot $E):

- Card name

• Board ID

SCSI devices:

• SCSI ID (0 to 6)
• Device type (hard drive, CD-ROM drive, tape, printer, etc.)
• Device name (if a mounted block-device)
• Device size (if known)
• Vendor ID (if applicable)
• Product ID (if applicable)
• Revision (if applicable)
• Device serial number (if applicable)

Floppy Drives:

• Drive ID (1 internal, 2 second or external, 3 if applicable)
• Drive type (800K, Apple SuperDrive, HD20, etc.)

External Monitors:

• Screen size (pixels)
• Grays/colors (same as in the monitors CDEV)
• Horizontal and vertical resolution
• Location of monitor (built-in, attached to built-in video, or attached to a video card in a NuBus slot); if monitor is the main screen.

Global Village Modems:

• Global Village modem is found (attached to modem port)
• Modem is found, but not recognized as a Global Village modem
• No modem is found

(Note: the search for a Global Village modem is primarily for Performa systems that are bundled with Global Village modem and a Club Performa America OnLine account.)

MacCheck: Operational Overview (8/93)

Revised: 8/23/93
Security: Everyone

MacCheck: Operational Overview (8/93)

==========

Article Created: 20 August 1993

TOPIC -----

This article is an operational overview of Apple's MacCheck software.

Several other articles in the Tech Info Library describe how you should respond to specific messages from MacCheck.

DISCUSSION -----

Launching MacCheck

When you launch MacCheck, a splash screen appears detailing the initialization processes that MacCheck performs while launching. MacCheck's primary task during launch is gathering profile information and checking for multiple System Folders.

Launch time can vary greatly. For example, on a new Macintosh LC III, MacCheck takes about 1 minute to launch. On a Macintosh Quadra 950 with 400MB hard disk and 8,000 files, MacCheck takes approximately 5 minutes to launch.

If you want to speed up the launch process by approximately 20 seconds, press the Space bar when the splash screen first appears. This tells MacCheck not to profile modems or check "slower" SCSI devices, such as DAT tape drives. MacCheck will then display a "•QuickBoot•" message.

If you want to quit MacCheck during the launch process at any time, type Command-period.

Accessing Profile Information

MacCheck stores the collected profile information in three log files:

- System Info Log
- Additional System Info Log
- Application and Font Info Log

To view the profile information placed into these logs, select the log you want from the Windows menu.

Starting Logic Board and File System Tests

To begin the logic board and the file system tests, click the Test button or choose Test (Command-G) from the Diagnostics menu. When testing is completed, MacCheck stores the results in a file named "Test Results-1". You may rename this file by choosing "Save Results As" from the File menu.

Getting Help

Consult the Help menu or click the Help button if you have questions about the information in the System Info, Additional System Info, or Application and Font Info logs. Help also provides suggestions and troubleshooting tips for any problems MacCheck finds.

Balloon Help is also available. Choose "Show Balloons" from the ? (Balloon Help) menu.

Using MacCheck Menus

- The File Menu: MacCheck logs are saved as individual documents, so the File menu items behave in similar ways as the File items in other applications, such as TeachText. As with TeachText, there can be only one open document at a time. Below are the menu items for the File menu:

  - New Results: Clears all the logic board and file system test information stored in the results file; does not clear the profile information after the bullets ("•••…") that MacCheck gathered during the launch process.

  - Open Results: Opens an existing "Test Results-1" log. MacCheck reads the contents in the four logs that were saved into that results file.

  - Save Results: Saves the results log, System Info log, Additional System Inf" log, and Application and Font Info log to "Test Results-1").

  - Close: Hides the front-most log or closes the "Help-Topics" window, if it was the front-most window. To make a log the front-most window, use the Windows menu and select the log you wish to view.

  - Print Results: Prints the front-most log. You also can choose to print any of the other three logs from the print dialog box.

- Diagnostics Menu:

  - Test:. Starts the logic board, file system, and System file checking tests. MacCheck performs the check for multiple System Folders only when first launched. Once MacCheck begins testing, the "Test…" item is dimmed.
  - Stop Testing: Enabled when testing is in progress.

- Windows Menu: When you select an log window in the Windows menu, MacCheck

will bring that log forward, making it the front-most window. If you have viewed Help, but not yet closed the "Help-Topics" window, you can also select the "Help-Topics" item from the Windows menu.

- Help Menu and Help Window: When you click the Help button in the main MacCheck window, or select "Topics" from the Help menu, MacCheck displays a window containing eight Help topics; each topic consists of one or more pages.

Note: When running MacCheck on a Macintosh Plus, SE, Classic, or Classic II, the "Help-Topics" window becomes a "modal" dialog box due to screen space constraints.

SNA•ps 3287 and LaserWriter Driver 8.0 Problem (1/94)

Revised: 1/4/94
Security: Everyone

SNA•ps 3287 and LaserWriter Driver 8.0 Problem (1/94)

==========

Article Created: 19 August 1993
Article Reviewed/Updated: 4 January 1994

TOPIC ----------

I'm encountering a problem between SNA•ps 3287 1.1.1 and LaserWriter driver 8.0. When I attempt to receive a print job from an IBM host I get errors with the PrintMonitor and my Macintosh locks up. I changed settings to receive the job as a text file and it worked fine.

I then installed LaserWriter driver 7.1.2, which comes with System Software 7.1, and receive a print job file and it printed properly. Is there a problem when using SNA•ps 3287 1.1.1 and LaserWriter driver 8.0?

I just recently purchased SNA•ps 3287, if I need to upgrade to SNA•ps Print what is the procedure and the cost if any?

DISCUSSION ----------

We did some testing with the new LaserWriter Driver 8.0 and SNA•ps. Here is what we found:

1) SNA•ps Print worked fine with LaserWriter 8.0 or 7.1.2 in both AS/400 and 3287 mainframe printer emulation.

2) SNA•ps 3287 worked fine with LaserWriter 7.1.2.

3) SNA•ps 3287 failed very badly with LaserWriter 8.0. It hung the PrinterMonitor and required a 'Stop Printing', dropping the PrintMonitor Document folder in the Trash (One document was X-ed out), and manually restarting the Macintosh with the Programmer switch. Menu Restart just hung in PrintMonitor.

So it looks like the workaround is to use LaserWriter Driver 7.1.2 with SNA•ps 3287 and if the LaserWriter 8.0 Driver is needed, LaserWriter 810, then you have to upgrade to SNA•ps Print.

Upgrades from SNA•ps 3287 to SNA•ps Print software are available; there is no charge for the upgrade. For more information on upgrades use the search string of "SNA•ps 3287 and upgrade" in the Tech Info Library.

Centris 660AV: Deskwriter Driver 3.9 Incompatibility (8/93)

Revised: 8/23/93
Security: Everyone

Centris 660AV: Deskwriter Driver 3.9 Incompatibility (8/93)

==========

Article Created: 23 August 1993

TOPIC -----

I have a DeskWriter printer (using DeskWriter driver version 3.9) connected to the Centris 660AV computer. The computer hangs with a blank screen (when doing a print job) unless I select the gray scale checkbox in the print dialog box.

DISCUSSION -----

We (Apple) tested the HP DeskWriter driver version 3.9 (both serial and AppleTalk) on the Centris 660AV and 840AV. As you stated, the 660AV required the gray scale option (checkbox) to be selected in order to print. The Centris 840AV had no difficulty printing.

As a workaround with the 3.9 driver, if you need the DeskWriter to print on the Centris 660AV computer, you will have to select the gray scale checkbox in the print dialog box.

We spoke with Hewlett Packard. They do not have a solution at this time.

Video Technologies: Composite vs. S-video (6/96)

Revised: 6/27/96
Security: Everyone

Video Technologies: Composite vs. S-video (6/96)

==========

Article Created: 24 August 1993
Article Reviewed/Updated: 27 June 1996

TOPIC ----------

What is the difference between composite video and S-video? Also, which Macintosh computers support these video technologies?

DISCUSSION ----------

The following Macintosh computers support both composite video and S-video input and output:

- Macintosh Quadra 660AV
- Macintosh Quadra 840AV
- Power Macintosh 6100AV series
- Power Macintosh 7100AV series
- Power Macintosh 8100AV series
- Power Macintosh 7500 series
- Power Macintosh 7600 series
- Power Macintosh 8500 series

The Macintosh Quadra 660AV and 840AV and the Power Macintosh 7500, 7600, and 8500 series computers have separate connectors for composite and S-video. The Power Macintosh 6100AV, 7100AV, and 8100AV series computers have S-video input and output connectors but require an adapter for composite video input and output.

Following are descriptions of composite video and S-video.

Composite Video

A composite video signal is one in which the luminance, chrominance, and sync information have been combined into a single signal using one of the coding standards: NTSC, PAL, SECAM, and others. This is the form the signal must take before it can be broadcast or recorded by standard means. Composite video is

more common than S-video, as televisions, most video- cassette recorders (VCRs), and laser disc players (LDPs) use the composite format.

Chrominance

The color part of a signal, relating to the hue and saturation but not to the luminance (brightness) of the signal. Any colored signal has both chrominance and luminance.

Luminance

The aspect of the video signal carrying information about the brightness of an image.

Sync

Short for synchronous. Refers to signals used to synchronize the horizontal and vertical scans of a video signal. This signal is derived from a composite or combination of horizontal and vertical drives, with some slightly narrowed and delayed pulses as well as the addition of equalizing pulses. When used, is usually accompanied by subcarrier.

S-video
===
An S-video signal is a consumer form of component video. It is used primarily with Super8 (Hi8 video or 8 mm tape) camcorders and S-VHS recorders (S-video on VHS tape). S-video is a less common -- but higher quality -- video format than composite video.

Component video

Component video is a recording system that does not require NTSC encoding of RGB signals, but uses a means of recording and routing the luminance and color signals separately. This method does not reduce bandwidth nor compromise the RGB components and results in images of higher resolution and better color quality than composite video. Though designed for high-end television production, similar recording methods have recently become available to the consumer market.

Macintosh: Sound Effects Extension (8/93)

Revised: 8/26/93
Security: Everyone

Macintosh: Sound Effects Extension (8/93)

==========

Article Created: 23 August 1993

TOPIC ----------

What is the Sound Effects extension? How do I use it? It's bundled with the Macintosh Centris 660AV and Quadra 840AV.

DISCUSSION ----------

The Sound Effects extension adds sound effects options to the Sound control panel. Follow these steps to use Sound Effects:

1) Locate the Sound Effects file and drag it to the icon of the System Folder of your startup disk. A message asks you to confirm that you want this file in the Extensions folder.

2) Choose Restart from the Special menu. The new options aren't available until the computer restarts.

3) Open the Sound control panel and choose Effects from the pop-up menu. The Effects section of the control panel appears, showing another pop-up menu.

4) Choose an effect from the pop-up menu. When you choose an item, the current alert sound plays with that effect. The effect you choose remains active for all sounds the computer plays until you restart the computer. At restart, the effect choice reverts to None. If you want to keep using a sound effect, you must choose it again.

Important Note: When a sound effect is active, you can't change the sample rate in the Sound Out section of the control panel.

Video Monitor Software: Options (8/93)

Revised: 8/26/93
Security: Everyone

Video Monitor Software: Options (8/93)

==========

Article Created: 23 August 1993

TOPIC ----------

Video Monitor software displays a live video image in a window on the screen and can capture one frame of the video image. It is bundled with Macintosh Centris 660AV and Quadra 840AV.

Basic instructions for this program are included in Chapter 6 of Getting Started With Your Macintosh, which came with your computer. This article describes some additional options in the Video Monitor application.

DISCUSSION ----------

Additional Video Monitor options:

- Preferences: Choose Preferences from the File menu to change the captured frame from a PICT file to an image on the Clipboard or to turn off compression of the captured frame.

- Printing a frame: Choose Print from the File menu to print one frame of the video image in the Monitor window.

- Capturing a frame: Choose Copy from the Edit menu to capture one frame of the video image in the Monitor window. (A message is displayed if the memory available is not sufficient to capture a frame.) The preset choice for frame capture saves the frame as a PICT file. The file is named PICT 0 (or the lowest number not already used) and stored on the desktop. You can use the Preferences dialog box to change frame capture from a PICT file saved on the desktop to an image stored on the Clipboard.

- Turning off sound: Choose Mute from the Monitor menu to turn off the sound accompanying the video displayed in the Monitor window.

- Resizing the Monitor window: Choose a size from the Monitor menu to resize the window displaying video. Or drag from the lower right corner of the

window. Hold down the Shift key while dragging to maintain the horizontal and vertical proportions of the image as the window is resized.

- Changing video settings: Choose Video Settings from the Monitor menu to adjust options for the video image.

- Changing sound settings: Choose Sound Settings from the Monitor menu to adjust options for sound accompanying the video displayed.

Important Notes
---

1) When the Video Monitor program is open, you can't give spoken commands.

2) When you quit Video Monitor, you may need to change the Sound In device setting to Microphone (under the Options button in the Sound control panel) before you can begin or resume using speech recognition.

Macintosh AV Systems: Displaying Video on Monitor (8/93)

Revised: 8/26/93
Security: Everyone

Macintosh AV Systems: Displaying Video on Monitor (8/93)

==========

Article Created: 23 August 1993

TOPIC ----------

Can I display video from my VCR or video camera on my Macintosh Centris 660AV or Quadra 840AV?

DISCUSSION ----------

Yes, you can. Below is the standard method for setting up the ability to display video a video signal, from a VCR, on the Macintosh monitor:

1) Assemble the VCR and cables you need to connect it to the Macintosh.

2) If the Macintosh and VCR are powered on, turn them off.

3) Plug one end of the single-RCA-plug cable into the Video Out socket on the VCR.

4) Plug the other end of the single-RCA-plug cable into the composite input port on the Macintosh.

5) Plug the dual-RCA-plug end of the other cable into the left and right Audio Out sockets on the VCR.

6) Plug the stereo-miniplug end of this cable into the sound input port on the Macintosh. You can use a Y-shaped adapter to convert a dual RCA-plug cable to one that has a stereo miniplug at one end.)

7) Turn on the computer and the VCR.

8) Open the Apple Extras folder on your hard disk and locate the Video Monitor application.

9) Double-click on the Video Monitor icon to launch the application. A black window titled "Monitor" will appear.

10) Turn on the VCR and press the play button. A video image will appear inside the monitor window.

Troubleshooting:

If a video image does not appear, try the following:

1) Choose Source from the pop-up menu at the top left side of the Video window.

2) In the dialog box which appears, review the choices selected in the Input and Format pop-up menus:

   - The Input choices indicate the input port for the video device. The preset choice is composite video, which is the standard for most VCRs.

   - The Format choices indicate the format, or standard, of the video signal. The preset choice is NTSC, which is used in the U.S. and Japan.

3) Make sure all of the cables are securely connected between the video device and the computer.

4) Make sure the video device is turned on.

MacCheck: What It Is (8/93)

Revised: 8/23/93
Security: Everyone

MacCheck: What It Is (8/93)

==========

Article Created: 23 August 1993

TOPIC ----------

This article describes the MacCheck application from Apple.

DISCUSSION ----------

MacCheck is a diagnostic application from Apple Computer, Inc.

At this writing, MacCheck is bundled with the following systems:
- Macintosh Performa
- Macintosh LC 520
- Centris 660AV
- Quadra 840AV

It is also included on the Software Utility Update Disk, which is distributed free of charge on AppleLink and other online services.

MacCheck assists Macintosh owners by providing the following diagnostic tests:

1) MacCheck creates a profile of your Macintosh computer, including:

- The processor, memory, expansion cards, SCSI drives, keyboard, monitor, etc.
- The installed applications and system software on your startup drive

2) MacCheck performs a number of tests, including:

- A general logic board test
- File system and System files test

- Duplicate System Folders test

For further information on MacCheck, search by the string "MacCheck" in the Tech Info Library.

Get Info Command: File Size Differences (8/93)

==========

Article Created: 25 August 1993

TOPIC ----------

I used the Get Info command on each folder on my hard drive to find the size, and added those numbers up. Then I used the Get Info command on my hard drive icon to find the size. The size difference is huge -- almost 30MB.

Why is this?

DISCUSSION ----------

It isn't surprising to see a large size difference between the hard drive itself and the total folders on the hard drive. Here are factors that explain the difference:

- The invisible files (such as AppleShare PDS, Desktop DB, Desktop DF, and Desktop Folder) aren't counted in Get Info size for folders.

- The size shown in the Get Info box for folders is the actual file size, which includes data and resource forks. For example, a text file which contains only 30 bytes, showed Size: 3K on disk (480 bytes used); 480 bytes (30 bytes for data, 450 bytes for resource) will be added to the folder Get Info size, and 3K will be added to the hard drive Get Info size.

  Since the hard disk is a block device, any file created must reside on the block factor boundary -- 3K, in this case, is the size that the disk drive allocates for this file. This accounts for a lot of differences, especially if you have a lot of small files on the drive.

LaserWriter IIg: Downloading Macros in PCL Mode (8/93)

Revised: 8/25/93
Security: Everyone

LaserWriter IIg: Downloading Macros in PCL Mode (8/93)

==========

Article Created: 24 August 1993

TOPIC ----------

When running a LaserWriter IIg in PCL mode (LaserJet emulation), there seems to be a problem in downloading multiple forms (PCL macros). If two forms are downloaded, only one will be available, and it varies which one.

The same problem does not occur with an HP LaserJet IIP. Multiple forms work fine. I am running PostScript from a LocalTalk network of Macintosh computers and PCL via RS-232 from an IBM RS/6000.

How does the memory on the LaserWriter IIg behave when switching between PCL (emulation) and PostScript modes? Does downloaded information remain resident for each mode?

DISCUSSION ----------

We were unable to duplicate the problem you outlined. We created and downloaded two simple macros to our LaserWriter IIg in PCL mode and were able to execute either one on command. We created and executed the macros using the following sequences:

<ESC>&f#Y

= 0 : To define the macro
= 1 : To end defining the macro
= 2 : To execute the macro
= 10 : To make the macro permanent

The last sequence, <ESC>&f10Y, is the key in keeping the macro available in the printer's RAM for use beyond the current job. There is a default amount of RAM set aside strictly for PCL emulation where this information will remain, unless the printer is power cycled.

With regard to your specific question about downloaded information while

switching between PostScript and PCL modes, this information does remain resident in RAM if the appropriate PostScript or PCL commands are used. In other words, <ESC>&f10Y for macros in PCL mode.

As you may know, in PostScript mode the server loop can also be exited where commands will remain persistent even beyond power cycles of the printer. We are unaware of a mechanism for this in PCL mode.

Newton MessagePad: Maximum Note Length (8/93)

Revised: 8/24/93
Security: Everyone

Newton MessagePad: Maximum Note Length (8/93)

==========

Article Created: 24 August 1993

TOPIC -----

What is the maximum size of a note in the Newton MessagePad's Note Pad?

DISCUSSION -----

Each note in the Note Pad has a maximum size of 4000 bytes. To check the current note size, tap on the little circled "i" icon at the top left of the note. If you are working with raw text in the default 18 point text size, you can write up to 12 screens of text per note.

Another limitation is that you can have approximately 50 items in a note, where an item can be a shape, ink (unconverted text), or a paragraph of converted text.

Shapes and ink are much more memory intensive objects than straight text.

Quadra 840AV: Using With NEC Multisync 6FG (8/93)

Revised: 12/2/93
Security: Everyone

Quadra 840AV: Using With NEC Multisync 6FG (8/93)

==========

Article Created: 26 August 1993

TOPIC --

I have an NEC MultiSync 6FG monitor. With a Macintosh Quadra 840AV, it works fine in 640 x 480 mode, but not 1152 x 870. It acts like it's not syncing correctly. (It works fine with a Quadra 800.)

DISCUSSION --

A Quadra 840AV connected to an NEC MultiSync FG 21-inch 6FG monitor requires the new AV 1152 X 870 or AV Multi-Res adapter. To obtain these adapters free of charge from NEC, call 312-622-7427. (General NEC Tech Support questions should be directed to 800-388-8888.)

Newton MessagePad: Clock Loses Time (8/93)

Revised: 8/24/93
Security: Everyone

Newton MessagePad: Clock Loses Time (8/93)

==========

Article Created: 24 August 1993

TOPIC -----

When I reset my Newton MessagePad, the internal clock loses time. What causes this?

DISCUSSION -----

Approximately once every 5 minutes, the Newton MessagePad saves the time on its clock to a location in memory. When you reset the Newton, its clock is reset to the last saved time. The result is that the clock can lose up to 5 minutes each time you reset your Newton.

Your Newton MessagePad doesn't save the time while it is asleep, so resetting your Newton when it is asleep could result in a greater than 5 minute time loss. We recommend you wake up your Newton before resetting it.

AppleShare Pro: Number Of Users and Groups (8/95)

==========

Article Created: 24 August 1993
Article Reviewed/Updated: 23 August 1995

TOPIC ----------

It is stated that AppleShare Pro can support a maximum of 200 simultaneous users. Is there a limit as to how many user ACCOUNTS can be defined under AppleShare Pro?

DISCUSSION ----------

On page 115 of the "AppleShare Pro Administrator's Guide" you will find the AppleShare Pro Specifications appendix.

Here is the contents of that page regarding the AppleShare Pro File Server:

Begin_Table

Maximum connected users	200	
Maximum number of open files	5,000	(may require adding RAM)
Maximum number of volumes	50	
Maximum number of shared items	50	
Maximum number of users in a user/group file	2,000	(Recommended)
Maximum number of groups in a user/group file	2,000	(Recommended)
Maximum number of group memberships per user	42	
Maximum number of simultaneous launches	200	

End_Table

NOTE: The maximum number of users in a user/group file and maximum number of groups in a user/group file in the manual is stated at 2,000. However, AppleShare Pro is based on AppleShare 4.0 code and the maximum number of users in a user/group file and maximum number of groups in a user/group file in the "AppleShare Administrator's Guide, Version 4" is stated as 8,192 (2,000 recommended).

Apple Workgroup Server 95 & Telnet (8/93)

Revised: 9/20/93
Security: Everyone

Apple Workgroup Server 95 & Telnet (8/93)

==========

Article Created: 24 August 1993

TOPIC -----

I've set up an Apple Workgroup Server (AWS) 95 following the instructions to install TCP/IP on the UNIX side with the newconfig command. I also set up MacTCP. However, I have been unable to get Telnet to work (a Macintosh version of Telnet) OR to get UNIX commands such as rlogin to work.

I want to use the machine to set up a listserver (running under UNIX). I want to use Telnet to connect to another site to a listserv. I also plan to use the server as a file server for our computer Lab.

I believe I'm having a problem with domain names, how do I install domain name service on the server? I'm told most computers support domain name service.

I have been able to ping within my subnet, but not outside of my subnet. This indicates that there has to be a way to specify the default gateway router, but I can't find how to do that.

DISCUSSION -----

First, the problem might have to do with "your set up of MacTCP under A/UX". I'm not sure how/what you did to setup MacTCP on A/UX. Under A/UX you don't have to "set up" MacTCP the same way as it does in Macintosh OS. MacTCP under A/UX will be automatically configured after configuring the TCP/IP network (such as IP address, subnet, name server, route, and so on) in the A/UX way. This information will be shown in MacTCP CDEV under A/UX.

Regarding domain name service, you may refer to the section of "Setting Up the Name Server" in A/UX Network System Administration for setting up the AWS 95 as a domain name server. If you only want the AWS 95 to be a client for accessing a remote domain name server, you can create the file called "resolv.conf" under the /etc directory with the following contents:

```
        domain YOUR-DESIRED-DOMAIN-NAME
        nameserver IP-ADDRESS-OF-THE-NAMESERVER
```

For example,

```
        domain support.apple.com
        nameserver 130.43.6.2
```

Here is an example of manually adding a default route in our network. You may put the following line in the /etc/rc file:

```
/usr/etc/route add 0 130.43.4.4 1
```

The IP address of 130.43.4.4 is an example of a cisco router, while 1 is the number of hups to get to the router from a local machine.

Performa Displays: Supported Macintosh Models (12/93)

Revised: 12/14/93
Security: Everyone

Performa Displays: Supported Macintosh Models (12/93)

==========

Article Created: 25 August 1993
Article Reviewed/Updated: 14 December 1993

TOPIC ----------

Do the Performa and Performa Plus Displays work with Macintosh models outside the Macintosh Performa family?

DISCUSSION ----------

The Performa and Performa Plus Displays are standard Macintosh monitors with a resolution of 640 by 480 pixels. In order to work with either of the Performa displays, a Macintosh must either:

1) Have built in video which supports 640 by 480 monitors - or -

2) Have a video card which supports 640 by 480 monitors.

As of August 1993, the following Macintosh models with built in video will work with the Performa and Performa Plus displays:

Macintosh LC, LC II, LC III, LC 475, LC 550
Macintosh IIsi
Macintosh IIci
Macintosh IIvx, IIvi
Macintosh Centris 610, Centris 650, Centris 660AV
Macintosh Quadra 605, Quadra 610, Quadra 660AV, Quadra 700, Quadra 800, Quadra 660AV, Quadra 840AV, Quadra 900, Quadra 950

The following Apple video cards support 640 by 480 monitors:

Macintosh II High-Resolution Video Card
Macintosh 4•8 Display Card
Macintosh 8•24 Display Card
Macintosh 8•24GC Display Card

Article Change History:
---
14 December 1993 - Added Macintosh models introduced since last update.
10 September 1993 - Revised article, adding info that Performa displays are standard 640 by 480 Macintosh monitors and any Macintosh with built-in video or any Apple video card which supports 640 by 480 will drive either Performa display.

Macintosh AV Series: Update Older Hard Disks (12/93)

Revised: 12/14/93
Security: Everyone

Macintosh AV Series: Update Older Hard Disks (12/93)

==========

Article Created: 25 August 1993
Article Reviewed/Updated: 14 December 1993

TOPIC ----------

I've heard that the Macintosh AV Series computers use a faster SCSI manager. Do I need to update my older drives I plan to use with the Centris 660AV, Quadra 660AV or Quadra 840AV?

DISCUSSION ----------

Yes, use HD SC Setup 7.2.2 to update any older hard disks you plan to use with the Centris 660AV or Quadra 840. Use the following procedure to update your hard disks:

1) Launch Disk First Aid 7.1.1 or higher. (Disk First Aid 7.2 is shipped on the Software Utility Update 1.0 and higher disk.)

2) Select the disk you wish to update.

3) Click the Start button (for Disk First Aid 7.2, click Verify.) Disk First Aid will inform you if any repairs are needed.

4) If repairs are needed, click the Repair button.

5) Repeat steps 2 through 4 for any additional hard disks you wish to update.

6. Quit Disk First Aid.

7) Launch HD SC Setup 7.2.2 or higher.*

8) Click the drive button to select the hard disk you wish to update.

9) Click the Update button. This installs the new version of the SCSI driver.

10) Repeat Steps 2 and 3 for any additional hard disks you wish to update.

11) Click the Quit button to return to the Finder.

*Notes: - Make sure that Disk First Aid and HD SC Setup is not running from any hard disk you wish to update.
- Make sure that none of the hard disk(s) you wish to update is the startup disk.)

Why Update Older Hard Disks?

The Centris 660AV and Quadra 840AV use a new SCSI Manager, 4.3, a new system level manager that extends the capabilities of Macintosh systems both in terms of functionality and performance.

This new SCSI Manager is fully asynchronous, allowing each of several SCSI devices to have multiple requests outstanding. By queuing requests in this manner, overall throughput is improved. Other features such as direct memory access (DMA) support further enhance overall performance. Functionality has been improved through support for multiple buses and hardware configurations, and support for SCSI-2 messages and protocol actions.

Hard disks not updated using HD SC Setup 7.2.2 or higher will run approximately 15-20 percent slower than updated hard disks.

Article Change History:
14 December 1993 - Added information on HD SC Setup 7.2.2 and on the Quadra 660AV. Retitled to include all Macintosh AV Series computers.

Video Signal: Composite vs. Component (8/93)

Revised: 8/25/93
Security: Everyone

Video Signal: Composite vs. Component (8/93)

==========

Article Created: 25 August 1993

TOPIC -----

This article defines composite and component video.

DISCUSSION -----

Component video

A term given to a recording system which does not require NTSC encoding of RGB signals, but uses a means of recording and routing the luminance and color signals separately. This method does not reduce bandwidth nor compromise the RGB components and results in images of higher resolution and better color quality than composite video. Though designed for high end television production, similar recording methods have recently become available to the consumer market.

Composite video

A composite video signal is one in which the luminance, chrominance and sync information have been combined into a single signal using one of the coding standards: NTSC, PAL, SECAM, etc. This is the form the signal must take before it can be broadcast or recorded by standard means. Until recently, most monitors and projectors have accepted only composite video signals, although many now available accept RGB. See NTSC. Compare component video.

In the United States, the NTSC composite signal format is required for most video recording, manipulation, and display. The exception is high-end post-production facilities that use component video for improved signal integrity.

NTSC Composite vs. Component

..TIL13063-Video_Signal-Composite_vsComponent_8-93_(TA21585).pdf

In a composite signal, the luminance signal and the color signals are encoded together into one signal. When the color components are kept as separate signals, the video is called component analog video (CAV), which requires three separate signals: the luminance signal (Y) and the color difference signals (R-Y and B-Y).

Because component video does not undergo the encoding process, the color quality is noticeably better than composite video.

Desktop Video: Glossary of Terms (A-C) (8/93)

Revised: 8/25/93
Security: Everyone

Desktop Video: Glossary of Terms (A-C) (8/93)

==========

Article Created: 24 August 1993

TOPIC ----------

This article describes desktop video terminology with words "A" through "C".

DISCUSSION ----------

A/B roll editing
Editing from two source VCRs to a third VCR. This allows for transition effects like dissolves from one source tape to another.

Aliasing
A term used to describe the unpleasant jaggy appearance of unfiltered angled lines. Aliasing is the “beating” effects caused by sampling frequencies being too low to faithfully reproduce an image. There are several types of aliasing that can affect a video image which include temporal aliasing (e.g. wagon wheel spokes apparently reversing) and raster scan aliasing (e.g. flickering effects on sharp horizontal lines).

Analog video
A video signal that represents an infinite number of smooth gradations between given video levels. By contrast, a digital video signal assigns a number for each level. The Macintosh video board converts computer-created (or digital) video to an analog signal for output to a monitor.

Animatic
A limited animation used to work out film or video sequences. It consists of artwork shot on film or videotape and edited to serve as an on screen storyboard. Animatics are often used to plan out film sequences without incurring the expense of the actual shoot.

ANSI
Acronym for American National Standards Institute, which sets standards for many technical fields.

Anti-aliasing
Anti-aliasing is the manipulation of the edges of an image, graphic or text, to make them appear smoother to the eye. On close inspection, anti-aliased edges appear blurred, but at normal viewing distance, the apparent smoothing is dramatic. Anti-aliasing is important when working with high quality graphics for television use. See aliasing.

Aspect ratio
The ratio of an image's width to its height. For example, a standard video display has an aspect ratio of 4:3.

Assemble editing
Adding new material to the end of a previously recorded portion of a videotape that involves writing a completely new signal (including the control track) onto the tape. Performing an assemble edit in the middle of an existing program will introduce an undesirable glitch on the tape caused by an abrupt change in the sync information of the video signal. Compare insert editing.

Asynchronous
Not synchronized by a mutual timing signal or clock. Compare synchronous. audio effects board The audio effects board is like the switcher, and acts as the main router and mixer for source audio. Here audio levels are adjusted, mixed, and filtered. Usually audio effects are kept to a basic level in a video editing session. More complex audio work is usually performed with a digital audio workstation.

Auto-assemble
If all the editing decisions are made off-line, and the EDL is loaded into the CMX the actual editing is automatic, executing one event after another. This is called auto-assemble mode. During auto-assembly, the editor monitors video and audio levels, but does not need to control each edit. Loading the EDL into the CMS is typically done manually, however, some Macintosh programs can create CMX disks. The EDL generated by computer based editing systems like the Digital F/X and Avid Media Composer are usually perfectly accurate, therefore, they make auto-assembly a breeze since the opportunity for errors in entering the EDL by hand are eliminated.

Bandwidth
The frequency range of a video signal, measured in MHz. The bandwidth is directly related to horizontal resolution—the higher number of picture elements defined, the higher the frequency required. Put another way, the bandwidth describes "how much" information is being transferred. The bandwidth of the Macintosh II video signal can be as high as 33MHz, depending on screen size. By comparison, the bandwidth of broadcast television is 4 MHz. High resolution images can be displayed on low resolution monitors, with an obvious loss in quality.

Black level
The level of the video signal that corresponds to the maximum limits of the black areas of the picture.

Black, black burst
In video production, black refers to a composite video signal which has composite sync, reference burst, and a black video signal. Used for genlock purposes.

Blanking
The portion of the video signal that is off, or black, during the retrace interval of the scan. Blanking occurs between each horizontal line and during the vertical retrace between each field.

Blanking is important in broadcast production situations since there are strict FCC rules defining the blanking periods. Not all video products for the Macintosh conform to this aspect of the NTSC broadcast standard. Discuss this issue with vendors if broadcast quality is required. Related to composite sync, this signal has both horizontal and vertical components and is at its negative level whenever video is to be blanked or turned off.

Blanking level
The level of a video signal that separates the range that contains the picture information from the range that contains the synchronizing information. The level of the front and back porches is 0 IRE units.

BNC connector
A connector typically used with professional video equipment for connecting cables that carry the video signal. Compare RCA connector and XLR connector.

Brightness
(1) The luminance of the video signal, or the level of brightness on the scale from black to maximum white. One of the three determinants (with hue and saturation) of the color of an image, and the only one of the three that affects a monochrome image. (2) The brightness of a monitor or video projector measured in lumens. See luminance.

Broadcast quality
An NTSC composite video signal conforming to FCC rules concerning signal properties like video and sync levels, timing and blanking. Devices providing NTSC signals do not necessarily meet FCC broadcast standards. This is important if the video signal or videotape being recorded is going to be used in a broadcast situation.

Bump-up
Making a copy from one recording medium onto a second medium which is more suitable for post-production purposes due to it’s higher bandwidth and/or timecode capability. For example, material shot on Hi8 is usually “bumped-up” to 3/4" SP or Betacam SP for editing purposes since these formats feature higher resolution, less generation loss, a more robust tape, timecode, better frame-accuracy and faster shuttle speeds.

CAV
Acronym for Component Analog Video.

CCITT
Abbreviation for Consultative Committee on International Telegraphy and Telephony; an international committee that sets standards and makes recommendations for international communication.

CG
Acronym for Character Generator.

CGI
Acronym for Computer Graphic Imagery.

Character generator
A character generator (CG) is a video device found in on-line editing suites used for titles and credits. A CG is simply a high-end word processor for video with a wide variety of fonts and sizes available. The most common character generator is the Chyron.

Chroma
The color information contained in a video signal, consisting of hue (phase angle) and saturation (amplitude of the color subcarrier).

Chroma keying
The process of overlaying one video signal over another, the areas of overlay being defined by a specific range of chrominance. For this process to work, the chrominance must have sufficient resolution, or bandwidth. Composite video does not have sufficient bandwidth for acceptable quality chroma keying, therefore analog chroma keyers typically use component sources.

Chrominance
The color part of a signal, relating to the hue and saturation but not to the luminance (brightness) of the signal. Any colored signal has both chrominance and luminance.

Clean list (clean EDL)
An EDL which does not contain any overlapping or redundant edits. Typically during the off-line editing process changes are made which result in edits that overlap or become redundant. Most computer-based editing systems can clean an EDL automatically.

CLIPPING
The process of cutting off the peaks of either the white or the black portions of a video signal.

CMX
The most commonly used editing computer. The EDL is loaded into it and it executes the edits and effects by controlling all of the required video machines. Actually, it may not control all of them. certain operations may need to be done manually. Most editing computers use the CMX language, which has become an industry standard.

Color bars
See NTSC color bars.

Color burst
A portion of the composite video signal used for decoding its color information. Burst is several cycles of 3.58 MHz pulses recorded during the horizontal blanking interval and used to establish phase relationships for determining the hue. The color oscillator of a color television receiver is phase locked to the color burst.

Color correction
A process in which the coloring in a video image is altered by electronic means.

Color subcarrier
The 3. 58 MHz signal which carries color information. This signal is superimposed on the luminance level. Amplitude of the color sub-carrier represents saturation and phase angle represents hue.

Component video
A term given to a recording system which does not require NTSC encoding of RGB signals, but uses a means of recording and routing the luminance and color signals separately. This method does not reduce bandwidth nor compromise the RGB components and results in images of higher resolution and better color quality than composite video. Though designed for high end television production, similar recording methods have recently become available to the consumer market. See S-VHS and Hi8. Compare composite video.

Composite blanking
see blanking.

Composite sync
A signal consisting of horizontal sync pulses, vertical sync pulses, and equalizing pulses only, with a no-signal reference level.

Composite video
A composite video signal is one in which the luminance, chrominance and sync information have been combined into a single signal using one of the coding standards: NTSC, PAL, SECAM, etc. This is the form the signal must take before it can be broadcast or recorded by standard means. Until recently, most monitors and projectors have accepted only composite video signals, although many now available accept RGB. See NTSC. Compare component video.

Compositing
Combining two or more video or electronic images into a single frame or display.

Conforming
The process of doing the final editing of a video using an off-line edited master as a guide.

Contrast
The range of light and dark values in a picture or the ratio between the

maximum and the minimum brightness values.

Control track
The portion along the length of a video tape on which sync control information is placed and used to control the playback of the video signal.

Control track editing
Editing videotape with equipment that reads the control track information in order to synchronize the editing between two decks. Frame accuracy is not certain as the VTRs can go slightly out of sync during pre-roll. Compare time code editing.

Control-L
See LANC.

Convergence
(1) The beam-position accuracy of the red, green, and blue beams of a color monitor or projector. Color systems require exact accuracy of beams, both for position and speed, to properly produce the desired colors from their phosphors. (2) The adjustment of the red, green, and blue electron beams in a monitor or video projector to align the red, green and blue images. cross color A defect characteristic of NTSC composite video that manifests itself as spurious rainbow patterns on highly textured objects like the one found on a striped shirt or tweed jacket. Cross-color defect is attributed to the make-up of the signal which mixes the high luminance and chrominance information in the same composite baseband spectrum. Johnny Carson used to wear ties with designs specifically designed to create this effect.

Cross luminance
A defect characteristic of NTSC composite video that appears as a dot pattern crawling up or hanging on the edges of color areas. This is a result of the signal structure where the color information leaks into the luminance signal. Also referred to as dot crawl.

DISCUSSION ----------

Gamut
The range of voltages allowed for a video signal, or a component of a video signal. Signal voltages outside of the range (i.e., exceeding the gamut) may lead to clipping, crosstalk, or other distortions.

Gate weave
An artifact of poor registration either during the film-to-tape transfer process or the actual filming that manifests itself as a weaving back and forth of the film image. See registration.

GBR
The same signals as RGB. The sequence is often rearranged to indicate the mechanical sequence of the connectors in the SMPTE standard.

Generation loss
With analog video formats extensive efforts are made to keep generations to a minimum since each successive generation will exhibit some loss of image quality in the form of noise and other artifacts. This characteristic varies from format to format. For example, 1-inch Type C exhibits almost imperceptible loss up to 4 generations while VHS shows considerable degradation each generation. With digital formats such as D-1 and D-2, however, this requirement is no longer necessary, since each copy can potentially be very close to perfect. This is especially important for applications such as compositing which require images to be dubbed several times.

Generations

The number of times a video clip is copied or processed. See generation loss.

Genlock
The capability to synchronize video signals from one device with those of another video source. This is required when mixing signals together as in overlaying computer graphics on an image from a camera, VCR or videodisc player to prevent screen flicker or rolling. Genlocking a Macintosh requires changing its video scan rate, switching the video into an NTSC timed interlaced image which can then be synchronized with the other video source. This requires either an encoder box attached to a video card which supports genlock or a scan converter. Genlock is a process of sync generator locking. This is usually performed by introducing a composite video signal from a master source to the subject sync generator. The generator to be locked has circuits to isolate vertical drive, horizontal drive and subcarrier. The process then involves locking the subject sync generator to the master subcarrier, horizontal, and vertical drives so that the result is that both sync generators are running at the same frequency and phase.

Ghost
A shadowy or weak image in the received picture, offset either to the right or to the left of the primary image. It is the result of transmission conditions where secondary signals are created and received earlier or later than the primary signal caused by a reflected RF signal.

Gray scale
A series of tones which range from true black to true white, it is usually expressed in 10 steps in video applications.

HDTV
High Definition Television. Still, to this day, limited to some very high-end applications. The FCC is close to establishing a broadcast standard for HDTV. The SMPTE has proposed a high definition television production standard consisting of 1125 lines, 2:1 interlace, 60 Hz field (30 frames/sec), a 16:9 aspect ratio and 30 MHz RGB and luminance bandwidth. Stay tuned for further developments.

Hertz (Hz)
The unit of frequency of vibration or oscillation, defined as the number of cycles per second. Named for the physicist Heinrich Hertz.

Horizontal blanking
The blanking signal that is produced at the end of each scanning line.

Horizontal blanking interval
The time between the display of the rightmost pixel on one line and the leftmost pixel on the next line.

Horizontal drive
See horizontal sync.

Horizontal resolution
The smallest increment of a television picture that can be discerned in the horizontal plane. This increment is dependent upon the video bandwidth and is measured in frequency or lines.

Horizontal scan frequency
The frequency at which horizontal sync pulses start the horizontal retrace for each line. A high frequency is needed for a non-interlaced scan. The horizontal sync frequency for a color Macintosh connected to the 13" RGB display is 35 KHz, while the NTSC frequency is 15.75 KHz. Projection of high resolution non-interlaced Macintosh color video requires projectors capable of 35 KHz horizontal sync frequency.

Horizontal sync
A signal created and used to synchronize the horizontal scan of a video signal, often combined with vertical sync into a composite sync. This signal is derived by dividing sub-carrier by 227.5 and then doing some pulse shaping. The signal is used by monitors and cameras to determine the start of each horizontal line. See horizontal scan frequency.

House sync
A common sync signal generated by a sync generator and fed to all video devices in an editing facility in order to synchronize the devices. See sync.

Hue
(1) The distinction between colors. Red, blue, green, yellow, etc. are hues. White, black, and gray are not considered hues. The dimension of color that is referred to a scale of perceptions ranging from red through yellow, green, blue back to red.

(2) The color tint of a video image. The color of an analog video signal is determined by three factors: hue, saturation and luminance. In a composite video signal, the hue is determined by the phase relationship to the color burst.

IEEE
The Institute of Electrical and Electronic Engineers, an organization which sets many of the standards in the electronic industry.

Interlace
An NTSC 525 line frame which is separated into two sequential scans, or fields, of 262.5 lines each. Field one scans the odd numbered lines and field two scans the even numbered lines creating two interlaced images per frame. The process results in 60 fields per second and is used to reduce the flickering which is apparent when the eye is presented with 30 images per second. In standard video, odd-numbered lines are drawn first. Most computer displays are not interlaced.

IRE scale, IRE units
A unit used for the measurement of video levels. The scale used for the graticule on a waveform monitor. 140 IRE represents 1.000 volts,

100 IRE represents 0.714 volts, while 1 IRE represents 0.007 volts.

ISO
Acronym for International Standards Organization.

Desktop Video: Glossary of Terms (D-F) (8/93)

==========

Article Created: 24 August 1993

TOPIC ----------

This article describes desktop video terminology, words "D" through "F".

DISCUSSION ----------

Decoder
A device used to recover the component signals from a composite (encoded) source. Decoders are used in displays and in various processing hardware where component signals are required from a composite source.

Delay line
A device designed to delay the video signal for a specific length of time. Required when switching between different types of devices or cameras with significantly different cable lengths.

Demodulate
To recover the information being transmitted by a modulated signal. For example, a conventional TV receiver demodulates an incoming broadcast signal to convert it into the luminance and chrominance information displayed by the CRT and the sound emitted by the speaker. Compare modulate.

Demodulator
A device which strip the video and audio signals from the carrier frequency.

Device interface
A converter box which separates the RGB and sync signals in order to display computer graphics on an RGB video monitor. Vendors include Covid and Extron.

Differential Gain (DG) and Differential Phase (DP)
The distortion characteristics of the chrominance signal expressed as a

numerical value which indicates to what degree the amplitude (differential gain as a percentage) and phase (differential phase in degrees) are distorted from the beginning and end of one horizontal scanning line.

Digital audio workstations
Computer-based systems for editing and manipulating digital audio. The audio can be synchronized with video for video post-production applications. Some common systems based on the Macintosh include Dyaxis, Pro Tools, Synclavier, and Dawn.

Digital disk recorder
A recorder much like a videotape recorder which uses large digital disk memories instead of tape. They can record and play back in single frame steps (with no pre-roll, since there is no tape involved), at variable speeds or at 30 fps. Digital disk recorders are available as both component and composite machines. Very, very, expensive. Digital disk recorders can usually mix an incoming video signal with a stored one and record the net result simultaneously. Since everything is digital, this mix can be performed repeatedly, producing layer upon layer of moving images.

Digital video
A video signal represented by binary numbers describing a finite set of colors and luminance levels. In accordance with “CCIR 601,” the international digital video standard for sampling, the conversion from analog to digital suffers virtually no loss.

With current technology, the cost of using digital video to represent the range of levels and colors easily handled by analog videotape is prohibitive. Digital video requires more bandwidth than analog video to produce the same results, unless fancy compression techniques are used. As digital memory capacity and processing speeds become more economical, digital video will eclipse analog video. Standards such as QuickTime, DVI, MPEG, and JPEG for video make digital manipulation of video information possible on today’s personal computers.

Note: consumer “digital” televisions and camcorders use the term to refer to the use of digital frame buffers for effects or signal processing. The output of these buffers is still converted back into analog signals for display and storage.

Digital Video Effects (DVEs)
A real-time frame buffer that can zoom in and out, reposition, and freeze frame in real time. Some can also warp video frames into trapezoids, cylinders, and spheres to create a variety of special effects. Common trade names include ADO, Encore, Mirage, and Pinnacle.

DIN
Acronym for Deutsche Industrie Normal, a European standards organization.

Dirty list (dirty EDL)
An EDL containing overlapping or redundant edits.
See and compare clean list.

Dither pattern
The matrix of color or gray-scale values used to represent colors gray shades in a display system with a limited color palette.

Dithering
A technique for alternating the values of adjacent dots or pixels to create the effect of intermediate values. In printing color or displaying color on a computer screen, the technique of making adjacent dots or pixels different colors to give the illusion of a third color. For example, a printed field of alternating cyan and yellow dots appears to be green. Dithering can give the effect of shades of gray on a black-and-white display, or more colors on a color display.

Dot crawl
See cross luminance.

Dot pitch
A measure of the distance between dots on the screen. The closer the dots, the sharper and clearer the image.

Dot space
The horizontal distance between dot centers. This distance depends on the character pitch in effect.

Drop-out
Missing information from magnetic tape caused by dust, lack of oxide, etc. Especially noticeable with a format such as Hi8 which packs a tremendous amount of information onto a tiny and fragile tape.

Dubbing
Making a copy from one recording medium to another. See bump-up.

Duration
The length or persistence of a signal in time. Compare frequency.

Dynamic tracking
The ability for a video head to “bend” back and forth enough to find an adjacent track and follow it. This allows true freeze-frame rather than only freeze-field display. It also allows for variable speed playback, including playing in reverse, which otherwise is not possible.

EBU European Broadcasting Union.

Edit Decision Lists (EDL)
The Edit Decision List, or EDL, is the data controlling the editing computer during an on-line session. It lists “in-points” and “out-points” for both the source playback decks and the record deck. These “events” can be for video, audio, or both. The EDL may control all sources, various effects machines (for fades and dissolves, for example) and the record deck. An EDL may be created manually after the off-line editing is complete or it may be generated by the edit controller used in more sophisticated

off-line systems. Computer based editing systems including the Digital F/X and Avid Media Composer will automatically generate an EDL. See off-line, on-line.

Effects
Effects involve any manipulation or processing of the video or audio signal. Though they are often used for gratuitous gimmickry, they can also be used for valid functional and aesthetic design purposes. Video effects seem to change annually, and are heavily technology-driven. Since they sometimes cannot be simulated in an off-line environment, the best way to prepare to use them is to look over the free demos available from various video facilities and vendors. Off-line systems like the Avid Media Composer allow you to preview most of the standard video effects.

EIA Electronic Industries Association.
The organization which determines recommended audio and video standards in the United States.

EIA sync see RS-170.

Encoded video
The encoded video signal is formed by starting with an RGB signal from the color television camera. This RGB signal is then processed through an encoder, known as the I and Q encoder, which converts the RGB into a composite NTSC signal. The encoded signal has all of the elements of the composite video signal: sync, burst, chroma, and luminance.

Encoder
A device which transforms NTSC timed red, green and blue signals into a single NTSC composite signal combining luminance, chrominance, and sync information. Compare decoder.

ENG Acronym for Electronic News Gathering.

Equalizer
(1) Equipment designed to compensate for loss and delay frequency effects within a system. (2) A component, or circuit, which allows for the adjustment of a signal across a given band

FCC Federal Communications Commission.
A federal bureau that regulates radio and television broadcast standards. FCC regulations carry the force of law.

Field
One complete vertical scan of the picture, containing 262.5 lines. Two fields make up a complete television frame; the lines of field 1 are vertically interlaced with field 2 for 525 lines of resolution in the NTSC standard.
In many respects, a video signal is best conceptualized as 60 separate images per second. When video is recorded from a video camera, each field represents an independent sample of time. This becomes apparent when video-originated material on a videodisc is still framed, one may see flutter: two different images shot 1/60 of a second apart from each other

on the same screen.

Film
While videotape is simple in structure but requires complex machines for recording, film is complex in structure but requires simple recording machines. Film cameras are simple and elegant machines, and when you think about it, the film itself is the recorder.

Film is often used in the production of video for a variety of reasons, including the high image quality of film transferred to video and the ability to record film at any frame rate the camera allows. There are no technical requirements for a particular frame rate as there are with video, each film frame is simply exposed to light, then advanced. Many film cameras have variable frame-rate capabilities—a concept totally foreign to video.

Film chain
A device used to transfer film to video. They are still used by some TV stations to broadcast programming distributed on 16mm film. See telecine.

First generation
The first time the signal is recorded on tape, that tape is called a first generation tape. Each time the tape is dubbed, a generation is added. See generation loss.

Fotovix
The brand-name of a device available from Tamron which provides a relatively inexpensive way to transfer still 35mm film slides and negatives to video.

Frame
The total area of the picture which is scanned while the picture signal is not blanked. A complete NTSC TV picture consisting of two fields; a total scanning of all 525 lines of the raster area; occurs every 1/30 of a second. In other countries where PAL and SECAM are the video standard, a frame consists of 625 lines at 25 frame/sec.

Frame grabber
A device allowing the real time capture of a single frame of video in a temporary buffer for manipulation or conversion to selected computer file formats. Some frame grabbers have buffers large enough to store several complete frames, allowing rapid capture of a number of images. The distinction between a frame grabber and a digitizer is that a digitizer captures a sequence of complete frames, and therefore must employ some form of compression and/or acceleration in order to operate in real-time.

Frames
NTSC video plays at 30 frames per second, and each video frame consists of two half-frames called fields. A field consists of every other horizontal line. When the video image is created on a TV set, the little scanning dot of light first scans across the topmost horizontal line, line 1. Rather than scanning along line 2 next, it scans line 3, then line 5, and so on. When it gets to the bottom (in half of the 1/30 second frame time), it

begins at the top again but on line 2, then line 4, and so on. This technique is called interlace, and it was invented because most people see a flickering image if television is scanned sequentially at 30 fps.

Frequency
The number of complete cycles transmitted per second. Frequency is usually expressed in hertz (cycles per second), kilohertz (kilocycles per second), or megahertz (megacycles per second). In acoustics, frequency of vibration determines musical pitch. Compare duration.

Desktop Video: Glossary of Terms (J-M) (8/93)

==========

Article Created: 24 August 1993

TOPIC ----------

This article describes desktop video terminology, words "J" through "M".

DISCUSSION ----------

Jitter
Small and rapid variations in a wave form due to mechanical disturbances, changes in the characteristics of components, supply voltages, imperfect synchronizing signals, circuits, etc.

Kelvin
Also expressed as Kelvin or K, the unit of measurement of the temperature of light In color recording, light temperature affects the color values of the lights and the scene that they illuminate.

Keying
The process of replacing part of one television image with video from another image. See chroma keying and insert keying.

Kilohertz (KHz)
One thousand hertz, or cycles per second. See Hertz.

LANC
A protocol defined by Sony which permits the external control of video devices and access to status information from the device. Also referred to as Control-L. See VISCA, Vbox.

Legal signal
A video signal in which each component does not exceed the specified gamut for the given format. Compare valid signal.

Light valve projector

A video projector design with very high light output. An example of a projector using this technology is the Talaria from General Electric.

Longitudinal time code (LTC)
Longitudinal time code (LTC) is recorded as an audio signal on the address track or one of the audio tracks of a video tape. It may also be recorded on a track of audio tape. LTC can be read at high tape shuttle speeds, allowing time code readers to stay “in-sync” during rewind or fast forward. Unfortunately, LTC cannot be read at very slow shuttle speeds (such as when you are “crawling” the tape frame by frame) or in pause. See SMPTE time code, compare vertical interval time code.

Looping
A term indicating that a high impedance device has been permanently connected in parallel to a video source.

LTC
See longitudinal time code.

Luminance
The aspect of the video signal carrying information about the brightness of an image.

Macintosh video
Typically refers to the signal produced by a Macintosh 8•24 display card or Quadra built-in video. Although several scan rates and resolutions are supported, when connected to the 13" RGB monitor the display resolution is 640 x 480 pixels with a 67.7 Hz scan rate.

Matte
(1) A film term sometimes used in video production work to denote a keyed effect, an insert of video signal information keyed from one source into a second video signal.

(2) A opaque piece of art or a model that leaves a selected area unexposed to be filled on a subsequent pass or in composite. Also referred to as a mask.

Mavica
The name-brand of a popular still video camera sold by Sony, See still video cameras.

Megahertz (MHz)
One million hertz, or cycles per second. See Hertz.

Metal particle tape
Videotape using iron in its pure metallic form, instead of as an oxide. Offers improved frequency response and wider dynamic range than traditional oxide formulations.

MIDI
Acronym for Musical Instrument Digital Interface. A standard communications protocol used by electronic music equipment allowing device control from

personal computers. MIDI has moved into the audio and video realm for mixing and editing.

MIDI time code
A time code system allowing timed device control through MIDI protocols. It has become more important in video post production as more and more people are working with personal computer based systems. Compare SMPTE time code.

Modulate
To modify or alter a signal so as to transmit information. For example, conventional broadcast television transmits the video image by modulating the amplitude and frequency of a carrier signal. Compare demodulate.

Moiré
Optical disturbance caused by interference of similar frequencies. The wavy effect produced by the convergence of lines. It usually appears as a curving of the lines in the horizontal wedges of a test pattern. It is a natural optical effect when converging lines in a television picture are nearly parallel to the scanning lines. Compare aliasing.

Monitor
A particular type of television that receives a composite and/or component video signal (as opposed to an RF signal) directly from a VCR, camera, or separate TV tuner for high quality picture reproduction. Does not contain a channel selector. Compare television receiver.

Monochrome signal
A single color video signal; usually a black and white signal or, sometimes, the luminance portion of a composite or component color signal.

Motion control photography
A system for using computers to precisely control camera movements so that different elements of a shot can later be composited in a natural and believable way.

Multiscan
A term taken by a particular manufacturer often used to refer to any multisync device. See multisync.

Multisync monitors (and projectors)
Video displays which accept a wide variety of horizontal and vertical timings, from NTSC to computer video signals. Multisync monitors and projectors will often automatically adjust to the appropriate timing. Since the horizontal frequency range varies among different models, product specifications should be checked to assure a monitor or projector will support the Macintosh connected to it.

Desktop Video: Glossary of Terms (N-P) (8/93)

Revised: 8/25/93
Security: Everyone

Desktop Video: Glossary of Terms (N-P) (8/93)

==========

Article Created: 24 August 1993

TOPIC ----------

This article describes desktop video terminology, words "N" through "P".

DISCUSSION ----------

Neutral colors
The range of gray levels, from black to white, but without color. For neutral areas in the image the RGB signals will all be equal, in color difference formats the color difference signals will be zero.

NTSC
(1) Abbreviation for National Television Standards Committee, which standardized the NTSC color broadcasting system which is used today in the in the US, Japan and elsewhere.

(2) The standard video format defined by the NTSC, also called composite because it combines all the video information, including color, into a single signal. See NTSC composite.

NTSC color bars
A pattern generated by an NTSC generator consisting of eight equal width color bars. Colors are white (75%), black (7.5% set-up level), 75% saturated pure colors red, green, and blue, and 75% saturated hues of yellow, cyan, and magenta. (Mixtures of two colors in 1:1 ratio without third color).

NTSC composite
A video signal standard proposed by the National Television Standards Committee of the Electronics Industries Association and adopted by the FCC for broadcast television in the United States. The signal is a composite video signal of 525 lines, interlaced, 60 fields per second (30 frames per second) with a bandwidth limited to 4 MHz so that it will fit into a 6 MHz

broadcast television channel without interfering with adjacent channels. NTSC is also the standard system for Japan.

The standard was created to allow color television signals to be compatible with existing monochrome (black and white) television. The restriction of compatibility with the earlier technology results in compromises in color image quality. The NTSC composite signal format is required for video recording except with devices which support component video.

Though there are 525 scan lines, more than 40 lines are blanked during vertical retrace periods. Overscanning and poorly adjusted televisions reduce the number of visible lines further, leaving viewers around 360 lines of video information in a normal television picture.

Macintosh video can be converted to NTSC composite using an encoder or scan converter. When using an encoder with a Macintosh video card there is an unavoidable reduction in image quality and single pixel lines, for instance, will flicker (unless the video card supports convolution) due to the interlaced nature of the NTSC signal. Images intended for NTSC use should be designed according to the limitations of the format, unless a more expensive scan converter is being used. See encoder and scan converter.

NTSC RGB
Interlaced red, green, and blue video signals timed to NTSC standards. Refers to three monochrome signals representing the primary colors of the image. This is a superior signal format to composite video which is one signal encoded from the three signals. An NTSC RGB signal differs from a component video signal which consists of Y, R-Y, and B-Y signals.

Off-line, off-line editing
The preliminary or rough edit usually done on a low-cost editing system using videocassette work tapes. In an increasing number of situations random-access non-linear editing system using digitized video or laserdiscs are being used for off-line editing. Allows editors to make decisions and gain necessary approvals before making the more expensive and demanding on-line edit.

Since the actual edit session in a professional video facility is very expensive, it is always best to make all editing decisions in advance. This is called off-line editing or off-lining. See window dubs, on-line, special effects.

On-line, on-line editing
The final edit of a video using original master tapes to produce the finished piece. An on-line edit suite usually has a full range of high-end video devices (switcher, TBCs, DVE, character generator, etc.) which would normally be too expensive to use during an off-line edit session.

The on-line session is where the actual editing and effects take place. It occurs in an edit suite with a professional editor (known as the on-line editor). Again, the more prepared you are, the better since “things happen.” It is very easy to go way over your budget estimate for an

off-line edit if your EDL contains little surprises like a mislabeled in-point. Computer based editing systems like the Digital F/X and Avid Media Composer automatically generate EDLs which are very accurate, reducing on-line time considerably. See CMX, special effects, window-dubs. Compare off-line.

Opticals
Visual effects produced optically using an optical printer that contains one camera head and several projectors. The projectors are precisely aligned in order to produce multiple exposures in exact registration on the film in the camera head. Rapidly being replaced with special high-resolution video devices for all but feature applications.

Overscan
(1) The television picture beyond area of normal screen size.
(2) A method by which the video image is scanned beyond the normal viewing area of the screen. Compare underscan.

Paintbox
Paintbox is the trade name for a device made by Quantel, however, it is generally used to describe a digital video paint program capable of drawing and shading images from scratch or from digitized video frames. The Paintbox creates only still images, but sequences of animated images can be made from the still images by loading frame by frame onto a Harry or equivalent.

PAL
Phase Alternative Line system. The television broadcast standard for most of western Europe. Based on the 50 Hz power system, it displays 625 lines interlaced at 50 fields per second (25 frames per second). By reversing the relative phase of the color signal components on alternate scanning lines, this system avoids the color distortion that appears in NTSC reception. PAL is not compatible with NTSC or SECAM, though conversion between the standards is possible. Video products to be used in Europe require compatibility with PAL standards.

Pedestal
See blanking level.

Period
The time elapsed during one complete cycle of a wave.

Phase
(1) A stage in a periodic process; a point in a cycle. (2) The relationship between two periodic signals or processes. (3) The amount by which the cycles of one wave precede or lag behind the cycles of another wave of the same frequency. (4) Some fraction of a wave cycle (measured from a fixed point on the wave).

Pre-roll
Almost all videotape decks need a running start to get up to speed. This is called pre-roll, and varies between machines from about 3 to 10 seconds. This means that for every edit, source and record decks must first stop,

count backward the exact number of frames required for pre-roll, begin playing simultaneously, then at the precise edit point begin recording. It is a mechanical and electronic marvel that video editing can be frame-accurate at all. See sync.

Primary colors
Colors, usually three, which are combined to produce the full range of other colors within the limits of a color system. All non-primary colors are mixtures of two or more of the primary colors. In television, the primary colors are a specific set of red, green and blue.

Pulse
A current or voltage which changes abruptly from one value to another and back to the original value in a finite length of time. Used to describe one particular variation in a series of wave motions.

Pulse distribution amplifier
An amplifier designed to boost the strength of the sync as well as other control signals to the proper level for distribution to a number of cameras, special effects generators, or other equipment.

Desktop Video: Glossary of Terms (Q-T) (8/93)

Revised: 8/25/93
Security: Everyone

Desktop Video: Glossary of Terms (Q-T) (8/93)

==========

Article Created: 24 August 1993

TOPIC ----------

This article describes desktop video terminology, words "Q" through "T".

DISCUSSION ----------

Radio-frequency (RF) modulator
A device that makes your television set work as a monitor. See modulator.

Rank
The brand-name of a device used for film-to-video transfer. See telecine.

Raster
The rectangular, repeating pattern of lines scanned in a video monitor or camera pickup tube creating the video image. The scan is a continuous cycle regardless of the image content.

RCA connector
A connector typically used for audio and video signals, with some professional equipment and most consumer equipment. Compare BNC connector, XLR connector.

RCA connector
A connector typically used for cabling in both audio and video applications.

Registration
(1) An adjustment associated with color monitors and projectors to ensure that the three electron beams (the three primary colors) are hitting the proper color dots/stripes on the phosphor screen, A similar adjustment exists on color tube cameras.

(2) The alignment of film frame-by-frame in a camera, projector or telecine. Good registration is critical in order to eliminate gate weave. See gate-weave.

Resolution
A measure that shows to what extent details can be distinguished on the TV screen. Generally called horizontal resolution when referring to a video image. It can be evaluated by establishing the limit to which lines can be distinguished on a test pattern with the naked eye. A broader frequency band of the video signal permits a higher resolution.

Macintosh video has a bandwidth of 30 MHz, resolving color images at 640 pixels by 480 pixels. This exceeds the capabilities of an NTSC composite signal.

RF
Radio Frequency refers to a composite video signal superimposed on a very high (radio) frequency capable of being broadcast through the atmosphere. Standard television sets receive these signals, separate the composite signal from the RF, and then decode and display the composite signal.

Until recently, television sets were designed to receive only RF signals, which were applied to their antenna terminals. VCRs, videodisc players and some computers provide RF signals for use with televisions. The process of mixing composite video with RF, only to have it removed again by the television, further degrades the image quality.

RGB
Red, Green, Blue. Refers to three monochrome signals representing the primary colors of the image. RGB signals are provided on individual outputs with composite sync available either on a fourth output or combined with the green signal. RGB signals can be interlaced (timed to NTSC standards) or non interlaced (at higher sync frequencies).

RGB monitor
A type of color monitor that receives separate signals for each color (red, green, and blue). See also composite video.

RGB, RGB Format, RGB System
Red, Green, and Blue. The basic parallel component set, in which a signal is used for each primary color; or the related equipment or interconnect formats or standards. The same signals may also be called GBR as a reminder of the mechanical sequence of connections in the SMPTE interconnect standard. See RGB component. Compare component video.

Rise time
The time taken for a signal to make a transition from one state to another; usually measured between the 10% and 90% completion points of

the transition. Shorter, or faster rise times require more bandwidth in a transmission channel.

Rotoscope
A camera set up that projects live-action film one frame at a time onto a surface so that an animator can trace complicated movements. The completed animation film exactly matches the motion of the original action.

RS-170
The EIA (Electronics Industries Association) standard that defines the timing of broadcast video in the United States, Japan, and several other markets. It specifies a 15.75-KHz horizontal and a 60-Hz vertical interlaced scan frequency as well as other aspects of the composite signal such as voltage, sync levels and timing of blanking. Interlacing is the process by which two fields, called scan lines, are interleaved on the screen. Due to the limitations of video devices at the time the standard was being set in 1957, the speed of broadcast signals and picture tubes required the image to be displayed in parts.

The solution allowed the partial update of video pictures to remain unnoticed to the viewer. An RS-170 video frame contains 525 lines and is displayed 60 times per second—for a total of 15,750 lines, or 15.75 KHz. Of these lines, only the odd or even lines are displayed with each frame. A total of 60 frames per second allows 30 frames per second, or a 30-Hz update of each line.

Like the RS-343 standard, RS-170 is strictly a timing specification for monochrome video signals. By combining three such signals to control individual red, green, and blue sweep circuits, you can create a full-color system. The RS-170 mode is available with the Macintosh video card as a way for VCRs and large screen projectors, not capable of high-frequency scans, to interface with the Macintosh.

Compare RS-343, RS-170A, RS-170 RGB.

RS-170 RGB
Refers to RGB signals timed to RS-170 specifications. Since the red, green and blue signals are actually individual monochrome signals representing their respective colors, RS-170 RGB merely refers to three black and white signals sharing one sync signal which is either provided separately as a fourth signal or (usually) combined with the green signal. Compare RS-170A, RS-170.

RS-170A
Twenty years after the drafting of RS-170, the EIA video signal standard proposal RS-170A evolved into what is known today as the NTSC composite video signal. RS-170A specifies timing of scans (essentially the same as RS-170: 15.732 KHz horizontal and 59.94 Hz vertical) and blanking as well as the 3.58 MHz burst required to decode the color signals. As adopted by the FCC for broadcast use, the standards are precisely adhered to and carry the force of law. For non-broadcast use, EIA standards are merely recommendations and are not enforced.

Specifications referring to RS-170A do not necessarily mean the signals are broadcast standard. RS-170 RGB, RS-170.

RS-343
An EIA (Electronics Industries Association) standard for non-broadcast high resolution monochrome video, specifying a 60 Hz non-interlaced scan with a composite sync signal with timings that produce a non-interlace (progressive) scan at 675 to 1023 lines.

While the Macintosh version of the RS-343 signal varies somewhat, it essentially follows the guidelines necessary for connection to RS-343 display devices. Therefore, with a display adapter (available from Covid , Extron, or Inline) the Mac can drive a RS-343 device (i.e. video projector or large monitor).

The major differences between Macintosh video and the RS-343 standard are: a separate TTL level composite sync signal on pin 3, the separate video lines used to produce RGB color, a vertical scan rate of 66.67 Hz to reduce screen flicker, and a voltage white level of 1 volt for its red and blue signals and 1.3 volts on its green signal. RS-343 provides for a 60-Hz signal but has been changed to 66.67 Hz on the Macintosh video card to prevent the screen flicker which is visible at 60 Hz. The inclusion of the analog composite sync found on pin 5 of the video card connector, called the green signal, allows for monochrome composite video.

S-video
A consumer form of component video (Y/C) used primarily with Hi8 and S-VHS equipment.

Safe title area
80 percent of the TV screen, from the center of the screen; that area of the display screen (and therefore of the camera scanning area) which will reproduce legible title credits no matter how poorly adjusted the monitor or receiver may be.

SC phase
The phase of the color subcarrier.

Scan converter
A device that changes the scan rate of a video signal and may also convert it from non-interlaced to interlaced mode. A scan converter allows computer graphics to be recorded on videotape or displayed on a standard video monitor.

Scan rate
The scan rate is the time it takes the electron gun to move across one line of the screen or repeat one entire screen. These values are known as the horizontal and vertical scan rates, respectively. The number of times a screen is redrawn each second. Computer display scan rates differ from standard video scan rates.

Scanning

The rapid movement of the election beam in a pickup device of a camera or in the CRT of a television receiver. It is formatted in a line-for-line manner across the photo sensitive surface which produces or reproduces the video picture.

SECAM
Systeme Couleur Avec Memoire. The television broadcast standard for France, the USSR and various eastern European countries. Like PAL, SECAM is based on a 50 Hz power system, but it utilizes a different encoding process and displays 819 lines interlaced at 50 fields per second. The color information is transmitted sequentially (R-Y followed by B-Y, etc.) for each line and conveyed by a frequency modulated subcarrier that avoids the distortion arising during NTSC transmission. SECAM is not compatible with NTSC or PAL, although conversion between the standards is possible.

Serial device control
Most professional video equipment can be controlled via an RS-232 serial port. The protocols used for controlling these devices varies from vendor to vendor, however, Sony’s protocol is supported by most editing systems.

Signal-to-noise ratio (S/N)
An S/N ratio can be given for the luminance signal, chrominance signal, and audio signal. The S/N ratio is the ratio of noise to actual total signal, and it shows how much higher the signal level is than the level of noise. It is expressed in decibels (dB), and the bigger the value is, the more crisp and clear the picture and sound will be during playback.

SMPTE
Society of Motion Picture and Television Engineers, pronounced “simptee.” An organization which studies and proposes standards for the film and television industry.

SMPTE format, SMPTE standard
In component video these terms refer to the SMPTE standards for parallel analog component video interconnection. The SMPTE has standardized both RGB and Y, Pr, Pb color difference systems (a version of Y, B-Y, R-Y).

SMPTE timecode
A coding scheme standardized by the Society of Motion Picture and Television Engineers (SMPTE). Frame accuracy is achieved through timecode, a method of coding a unique “stamp” on each frame. Timecode consists of four numbers representing hours, minutes, seconds, and frames, for example, 23:59:59:29.

Since color video actually runs at 29.97 fps rather than 30 fps, two kinds of timecode have evolved: drop fame and non-drop frame. Drop-frame timecode literally drops certain agreed-upon numbers to compensate for the 0.03 fps discrepancy. Drop-frame timecode allows a 30:00:00:00 tape to really be 30 minutes long, which is critical in

broadcast applications. For non-broadcast applications it tends to do nothing but create problems, and non-drop-frame timecode is usually preferred.

Most of the low-end videotape formats, like VHS and Video 8 do not have timecode. They can count frame pulses on the tape, but are not frame-accurate. Sony has introduced “8mm timecode” in order to support more accurate editing applications with Hi8.

There are two basic techniques used to record SMPTE time code on videotape, see longitudinal time code (LTC) and vertical interval time code (VITC).

Snow
(1) Random noise on the display screen, often resulting from dirty videotape heads. (2) TV signal breakup caused by weak or no video reception.

Sound digitizer
A device for recording natural sounds and voices and storing them as computer files. Once digitized, the audio can be easily edited or used to create various effects. On the low-end there are products like the Farallon MacRecorder or Apple’s built-in capability on some Macintosh models. With the AudioMedia card or Pro Tools interface from DigiDesign, CD-quality sound digitizing is possible with the Macintosh.

Split screen
A special effect utilizing two or more video sources so that two or more scenes are visible simultaneously on each part of the screen. Often used to make window-dubs of multi-camera shoots. A useful means for comparing two sources simultaneously. Permits a fast visual check of the phase and sync timing between two inputs.

Staircase
A pattern generated by the NTSC generator, consisting of equal width luminance steps of 0, +20, +40, +60, +80, and + 100 IEEE units and a constant amplitude chroma signal at color burst phase. Chroma amplitude is selectable at 20 IEEE units (low stairs) or 40 IEEE units (high stairs). The staircase pattern is useful for checking linearity of luminance and chroma gain, differential gain, and differential phase.

Standard, interconnect standard
The specific signal configuration, reference pulses, voltage levels, etc. which describe the input/output requirements for a particular type of equipment. Some standards have been established by professional groups or government bodies (such as SMPTE or EBU). Others are determined by equipment vendors.

Still video cameras
Still video cameras are cameras that look like something in-between a still and a video camera. The Sony Mavica records on a two-inch disk

that holds 25 frames or 50 fields on flexible disks which are erasable and reusable. The encoding is analog component, but with less bandwidth (and therefore a noticeably lower quality image).

Electronic still photography has been used for “electronic journalism," where images are shot in the field and sent by modem from any available phone. These cameras have already begun to replace still picture film cameras for many applications which do not require the high resolution and image quality of 35mm still picture film.

Sub-carrier
A 3.58 MHz signal modulated by color signals and combined with luminance signals to produce an NTSC composite video signal.

Subcarrier (SC, 3.58, 3.58CW)
This is the basic signal in all NTSC sync signals. It is a continuous sine wave, usually generated and distributed at 2 volts in amplitude, and having a frequency of 3.58 MHz. Subcarrier is usually divided down from a primary crystal running at 14.32 MHz, and that divided by 4 is 3.58. All other synchronizing signals are directly divided down from the subcarrier.

Subcarrier phase shifter
Special circuitry designed to control the phase relationships of the two portions of the encoded color signal so that they maintain their correct relationship during recording transmission and reproduction.

Switcher, video switcher
The switcher is the central router and mixer of video source material in an on-line suite. Switchers are generally analog devices, and are capable of performing analog effects as well as switching incoming channels. These effects include fades and dissolves, wipes and borders, and keys (opaque overlays based on replacing black or a particular color). In earlier days this was called the “special effects generator” or SEG.

Sync
Short for synchronous. Refers to signals used to synchronize the horizontal and vertical scans of a video signal. This signal is derived from a composite or combination of horizontal and vertical drives, with some slightly narrowed and delayed pulses as well as the addition of equalizing pulses. When used, is usually accompanied by subcarrier.

Synchronization of video tape recorders
In order for any mixing or editing of video signals to occur, all source and record decks must be in sync with each other, running at exactly the same speed and in identical phase. You can picture the process as being similar to transferring goods between high-speed trains running alongside each other. In editing facilities, all decks are fed a common sync signal, called “house sync.” See pre-roll. Without synchronization, each individual transport would all run at slightly different rates. Analog tape transports, being mechanical,

have small fluctuations in tape speed called “wow and flutter". The capstans on tape machines can slip over time as well, also generating changes in tape speed.

With disk-based systems there is no mechanical transport and no tape. Instead, the playback and record speeds are controlled by quartz crystal oscillators. However, no two oscillators are exactly the same, and an oscillator's frequency can vary with time and temperature. What all this means is that any two transports, even when started at exactly the same time, will begin to drift apart over time and the audio on the different systems will eventually drift out of sync. Synchronization is achieved in these systems by constantly checking to see the current SMPTE frame, and adjusting the playback speed to keep all devices locked. In analog systems, this is achieved by automated motor speed control. In digital systems it is achieved by adjusting the playback sample rate. See sync, SMPTE time code.

Synchronous
Able to perform two or more processes at the same time, such as sending and receiving data, by means of a mutual timing signal or clock. Compare asynchronous.

Synchronous transmission
A transmission process that uses a clocking signal to ensure an integral number of unit (time) intervals between any two characters. Compare asynchronous transmission.

Telecine
(1) A device which consists of a projector without the lens and a video camera aimed directly at the illuminated film to record it. A telecine projector incorporates a five-bladed shutter splitting the film into 1/120 second flashes and resulting in two exposures of film for each video field. Since these would not necessarily be of the same film frame, the video fields would often have two different images superimposed. This can cause problems with videodisc still framing.

(2) A Rank or Bosch. These are the highest-quality devices for film-to-video transfer. Unlike a telecine projector, they do not use a lens. Instead, a dot of light on one side of the film and a light sensor on the other side is used to scan the film. The Rank uses a small picture tube as the source of the dot of light. This is called a flying-spot scanner. The Bosch uses a one-dimensional CCD array. Both the Rank and the Bosch produce excellent results. The Rank has the advantage of changing the scanning size electronically, allowing control over the size and position of the film area being scanned. Both of these machines have highly developed methods of color correction, allowing very selective work. For example, a single shade of color in a particular area of the picture can be changed without affecting anything else.

Television receiver
A device capable of accepting video signals broadcast as RF. Also capable of producing a demodulated video signal output from a off-air

input signal. Compare monitor.

Test pattern
An optical guide for television camera reference alignment.

Time base corrector (TBC)
A time base corrector, or TBC, is a device which corrects the timing irregularities that occur during VTR playback.

Since synchronization between videotape decks is so important, it is imperative that all decks perform at precisely the same speed. Speeds always vary, at least slightly, due to VCR velocity errors and tape stretch. TBCs are essential for any kind of multiple mixing of input from videotape source decks, including wipes, dissolves, and overlays. Each source deck must have its own TBC, and each must be synchronized to “house sync.”

TBCs are also used simply to “clean up” the timing of a recorded video signal. These TBCs act like black boxes, taking in unstable video and putting out stable video. Because they work alone, without house sync, they are often called standalone TBCs.

Time base stability
The maintenance of the scanning process to very close tolerances. See time based corrector.

Time code
See SMPTE time code.

Time code editing
By recording a sequential time code along with the video and audio material, you can obtain a precise reference for editing. Each frame has its own number or code which tells the time in hours, minutes, and seconds, and includes a frame number. The industry standard code is called SMPTE time-code .Time code permit very fast and accurate editing. Automatic editing is possible using an edit controller. See EDL, edit controller. Compare control track editing.

Timecode, 8mm
8mm timecode is a proprietary form of timecode used by Sony with some of their Hi8 products. Compatibility problems in time-code editing environments is solved by using a third-party device made by Horita that converts the timecode from the Sony EVO-9850 and EVO-9800 editing decks to standard SMPTE time code.

Title generator
A black and white camera that is used to shoot titles which are electronically superimposed on the video picture while shooting or during editing. Title color can be selected and changed independently. A more sophisticated device know as a character generator (CG) can generate titles directly.

Tracking

The angle and speed at which the tape passes the video heads.

Transcoder
A device used to convert from one video component set to another. For example, to dub a Hi8 tape to Betacam SP with the highest possible results, you would need to use a transcoding TBC which includes a transcoder capable of converting the Hi8 (Y/C) signal to the Betacam SP component (Y, R-Y, B-Y) signal.

TTL RGB
A type of video monitor that can accept only a limited number of digital values and display only a correspondingly limited number of colors. Compare analog RGB.

Desktop Video: Glossary of Terms (U-V) (8/93)

==========

Article Created: 24 August 1993

TOPIC ----------

This article describes desktop video terminology, words "U" through "V".

DISCUSSION ----------

Underscan
A mode available on professional video monitors which decreases the raster size H and V so that all four edges of the picture are visible on the monitor. Allows viewing of skew and tracking which would not be visible in normal (overscanned) mode. Also helpful when aligning test charts to be certain they touch all four corners of the raster.

Valid signal
A video signal which will remain legal when transcoded to any other format. Signals which are not valid will be processed without problems in their current format, but problems may be encountered if the signal is transcoded to a different format. For example, the Macintosh will let you generate highly saturated colors which may be legal in the RGB domain, however, when converted to composite video will exceed the NTSC specifications. A valid signal is always legal, but a legal signal is not necessarily valid.

Vbox
The Vbox is a an interface device which can be connected to a personal computer via an RS-232 serial interface. Through the Vbox the computer can control LANC (a.k.a. Control-L) compatible video devices. The Vbox translates the VISCA commands from the computer into Sony’s LANC protocol. Up to 7 Vboxes can be daisy-chained from one serial port. See LANC, VISCA.

VCR
Video Cassette Recorder. See VTR.

Vectorscope

A round oscilloscope used to analyze and align the amplitude and phase of the color video signal.

Vertical blanking
See vertical interval.

Vertical interval
The period of time during which the scan is retraced from the bottom of the screen back to the top. The picture is blanked during this part of the scan. The vertical interval period contains sync pulses and in broadcast use, can contain network information, test signals and closed captioning signals.

Vertical interval time code (VITC)
VITC is recorded within the video signal, each timecode stamp is recorded between the video frames, during the vertical blanking interval. VITC cannot be recorded on audio tracks. With VITC, video devices can capture the timecode from the video deck when it’s paused or in “crawl” mode, however, most synchronizers cannot read VITC at speeds exceeding about ten times playback speed, preventing slaved machines from maintaining synchronization during rewind and fast forward. See SMPTE time code, compare longitudinal time code.

Vertical retrace
The return of the electron beam to the top of a television picture tube screen or a camera pickup device target at the completion of the field scan.

Vertical scan frequency
The frequency of the vertical sync pulses, or the frequency of the vertical scan. NTSC vertical scan frequency is 59.9 Hz. The Macintosh video vertical scan frequency is 67.7 Hz.

Vertical sync
A pulse used to trigger the vertical retrace of a scanning electron gun from the bottom of a frame back to the top.

Vertical sync pulse
A portion of the vertical blanking interval which is made up of blanking level and six pulses (92% duty cycle at -40 IRE units) at twice the horizontal sync pulse repetition rate. Synchronizes vertical scan of television receiver to composite video signal. Starts each frame at same vertical position (sequential fields are offset 1/2 line to achieve interlaced scan.

Video
(1) A means for reproducing moving visual images by representing them with an analog electronic signal. The images are decomposed into a series of horizontal scan lines. In this way the signal can be stored, transmitted and reproduced. See rasterization, field, frame.

(2) Referring to the NTSC composite video standard. This is a widespread standard such that the “video in” of one machine is compatible with the

“video out” of another.

(3) There are various standards which define this signal, see RS-170, RS-170A, NTSC, PAL, SECAM, RGB, CAV.

Video distribution amplifier
A special amplifier for strengthening the video signal so that it can be supplied to a number of video monitors or other devices at the same time.

Video editing
Editing is the process of selecting the frames and arranging them on the edit master videotape. In professional applications usually edits must be frame accurate. For example. when mastering a laserdisc frame accuracy absolutely essential, especially when single frame elements are involved. See off-line, on-line, et al.

Video format
A standard determining how a video signal is recorded onto videotape. These include 1-inch Type C, 3/4" U-Matic, 3/4" U-Matic SP, Betacam, Betacam SP, M-II, D-1, D-2, D-3, VHS, Hi8, Video 8, Beta, and S-VHS.

Video monitor
A display device that can receive video signals by direct connection only and cannot receive broadcast signals such as commercial television; it can be connected directly to the computer. Compare television set.

Video recording
Any image, still or moving, can be converted into a video signal, most often through a video camera. Then the video signal can be recorded. By far the most common method of recording video is on videotape.

Video signal
A dynamic signal which represents the varying levels of a video image but does not contain the sync pulses for its display. The video signal can be combined with sync pulses into a composite signal.

Video waveform
The pictorial display on a waveform monitor (a special oscilloscope) of the various components of the video signal, used to check the integrity of the signal and signal components.

Videocassette
A self-contained video module played on a specially designed video tape recorder; similar in design to an audio cassette; houses two reels (supply and take-up) with the tape running between them but connected to both.

Videodisc
A double-sided optical disc capable of storing and playing back full-motion video. Videodisc has come to refer to all video media that are disc-shaped, regardless of whether they are optical or magnetic, digital or analog.

Videotape
A magnetic medium capable of storing an electronic signal and consisting of

backing, binder, and coating. The coating usually consists of iron oxide, however, metal particle or metal evaporated coatings are also used.

Videotape formats
Videotape equipment ranges in price from $250 for a bargain-basement VHS deck to over $200,000 for a digital component deck. Nevertheless, both produce the same 525-line, 30-frame-per-second image. The differences lie in visual quality, generation loss characteristics and in control capabilities.

VISCA
Acronym for Video System Control Architecture. VISCA is a device control language designed for synchronized control of multiple video devices. The protocol is device and platform independent. See LANC, V-Box.

VITC
See Vertical Interval Time Code.

VTR
Video Tape Recorder. An electro-mechanical device capable of recording, storing, and reproducing an electronic signal which contains audio, video, and control information. The term VTR includes reel-to-reel and cassette type (VCR) recorders.

Desktop Video: Glossary of Terms (W-Z) (8/93)

Revised: 8/25/93
Security: Everyone

Desktop Video: Glossary of Terms (W-Z) (8/93)

==========

Article Created: 24 August 1993

TOPIC ----------

This article describes desktop video terminology, words "W" through "Z".

DISCUSSION ----------

Waveform
(1) The shape of a wave (a graph of a wave’s amplitude over time).
(2) Slang for waveform monitor.

Waveform monitor
An oscilloscope used to display the video waveform.

Wavelength
The horizontal extent of one complete cycle of a wave.

Window dubs
The trick to off-lining is to always have access to the timecode for all of the source material. If the source medium is of professional quality, like Betacam SP, then viewing the material is expensive and complex. But it is also unnecessary: the material can be transferred to a more accessible medium, like 3/4-inch or VHS tape, with the timecode “burned in” on the picture, usually near the bottom. This is called a window dub. Each video frame is marked permanently with the exact timecode number. The advantage this offers is the ability to see the timecode on a VCR without a timecode reader. This assures frame accuracy during off-lining. Window-dubs are the video equivalent of workprints in film.

Wipe
A visual transition between images during which the edge of one image moves across the screen revealing the next image.

Wow and flutter

Small fluctuations in tape speed. Wow is a gradually occurring change; flutter is a rapidly occurring change. A widely used specification in analog audio and videotape recorders.

XLR connector
A connector with three conductors used in professional audio applications, typically with a balanced signal. Compare RCA connector and BNC connector.

Y, C1, C2
A generalized set of CAV signals: Y is the luminance signal, C1 is the 1st color difference signal and C2 is the 2nd color difference signal.

Y, I, Q
The set of CAV signals specified for the NTSC system: Y is the luminance signal, I is the 1st color difference signal and Q is the 2nd color difference signal.

Y, Pb, Pr
A version of component video (Y, R-Y, B-Y) specified for the SMPTE analog component standard .

Y, R-Y, B-Y
The general set of CAV signals used in the PAL system as well as for some encoder and most decoder applications in NTSC systems; Y is the luminance signal, R-Y is the 1st color difference signal and B-Y is the 2nd color difference signal.

Y, U, V
The luminance and color difference components for PAL systems; simply the Y, B-Y, R-Y components with new names. The derivation from RGB is identical.

Y/C Delay
Lag of timing between the luminance (Y) and chrominance (C) signals.

Video Definitions: NTSC, PAL, SECAM (8/93)

Revised: 8/25/93
Security: Everyone

Video Definitions: NTSC, PAL, SECAM (8/93)

==========

Article Created: August 25 1993

TOPIC ----------

There are currently three standards in the world for composite, color encoded video: NTSC, PAL and SECAM. Standards exist for High Definition Television (HDTV), however, this article will only discuss the broadcast formats currently in wide use.

DISCUSSION ----------

NTSC

NTSC stands for the National Television System Committee of the Electronics Industries Association, the organization which defined the standard format adopted by the FCC for broadcast television in the United States. NTSC is also the standard used in Japan, Canada, and Mexico.

"NTSC" is usually taken to mean the NTSC color television system itself, or its interconnection standards. This is also called "composite video" because all of the video information—sync, luminance, and color—are combined into a single analog signal.

"NTSC" is often said to stand for "Never The Same Color." When color broadcasting first became a commercial possibility, the standard was created to allow color television signals to be compatible with existing black and white television. The restriction of compatibility with the earlier technology results in compromises in color image quality.

PAL

"PAL" stands for Phase Alternation by Line, the broadcast video standard used in West Germany, Great Britain and most Western European nations.

By reversing the relative phase of the color signal components on alternate

scanning lines, this system avoids the color distortion that appears in NTSC. Otherwise, PAL closely resembles NTSC. Based on the 50 Hz power system, PAL displays 625 lines interlaced at 50 fields per second (25 frames per second).

PAL is not compatible with NTSC or SECAM, though conversion between the standards is possible. Video products to be used in Europe require compatibility with PAL standards.

SECAM

"SECAM" is an abbreviation for Séquential Couleur à Mémoire, the line sequential color system used in France, Russia, Eastern Europe and some Middle Eastern countries.

Like PAL, SECAM is based on a 50 Hz power system, displaying interlaced lines at 50 fields per second. The color information is transmitted sequentially (R-Y followed by B-Y, etc.) for each line and conveyed by a frequency modulated subcarrier that avoids the distortion arising during NTSC transmission.

SECAM is not compatible with NTSC or PAL, although conversion between the standards is possible.

Security: Everyone

Adjustable Keyboard: Command Key Shortcuts & VersaTerm (2/95)

==========

Article Created: 25 August 1993
Article Reviewed/Updated: 02 February 1995

TOPIC ----------

When I use my Adjustable keyboard with VersaTerm Pro, the Command-key shortcuts are not recognized. Is there something included with System 7.1 that fixes the problem?

DISCUSSION ----------

Apple Support used VersaTerm-Pro 3.6.3, with the Adjustable Keyboard and did not have any problems with any command key shortcuts. Specifically, we used the following command key shortcuts:

CMD-S calls up Send files
CMD-Y calls up Text Options
CMD-I goes off/on line
CMD-K clears page
CMD-J jumps back

To answer your question, there is nothing in System 7.1 to fix the Adjustable keyboard. You may want to check your version of VersaTerm Pro.

Workgroup Server 80 & 95: Reading Status Lights (8/93)

Revised: 8/26/93
Security: Everyone

Workgroup Server 80 & 95: Reading Status Lights (8/93)

==========

Article Created: 26 August 1993

TOPIC ----------

How do I read the status lights on the Apple Workgroup Servers 80 and 95 ?

DISCUSSION ----------

The front panel has two bi-color lights (LEDs). Green is used to indicate normal operation and Amber is used to imply warning conditions. Pulsing usually shows activity between the drive and the SCSI bus. If the cassette Light (Left) shows a steady Amber, this indicates that the cassette is write protected. If the Drive Light (Right) shows a steady Amber, this indicates a fault condition.

The following table lists the possibilities:

	Cassette Light	Drive Light	Meaning
Read / Write States	Pulse Green	Pulse Green	Cassette (Unloading)
	Green	Green	Cassette Loaded/Online
	Green	Pulse Green	Cassette Loaded/Activity
	Green	Off (No Light)	Cassette Loaded/Offline
Write-Protect Status	Pulse Amber	Green	Casette (Unloading)
	Amber	Green	Cassette Loaded/Online
	Amber	Pulse Green	Cassette Loaded/Activity
	Amber	Off (No Light)	Cassette Loaded/Offline
Error States	Green	Pulse Amber	Media Wear (Caution)
	Amber	Amber	High Humidity, No termination on SCSI bus
	Pulse Amber	Pulse Amber	Self Test (Normal)
	Pulse Amber	Amber	Self Test (Failure)

Other States	Off (No Light)	Off (No Light)	No cassette loaded
	Off (No Light)	Green	Error (illegal state)
	Off (No Light)	Pulse Green	Error (illegal state)
	Off (No Light)	Amber	Error (illegal state)
	Off (No Light)	Pulse Amber	Error (illegal state)
	Pulse Green	Off (No Light)	Error (illegal state)
	Pulse Green	Green	Error (illegal state)
	Pulse Green	Amber	Error (illegal state)
	Pulse Green	Pulse Amber	Error (illegal state)
	Pulse Amber	Off (No Light)	Error (illegal state)
	Pulse Amber	Pulse Green	Error (illegal state)
	Green	Amber	Error (illegal state)
	Amber	Pulse Amber	Error (illegal state) (Write Protect on)

Apple Workgroup Server 95 PDS Card: SCSI Port Max Transfer Rate

Revised: 8/26/93
Security: Everyone

Apple Workgroup Server 95 PDS Card: SCSI Port Max Transfer Rate

==========

Article Created: 26 August 1993

TOPIC ----------

What is the maximum transfer rate of the SCSI ports on the Apple Workgroup Server 95 PDS card?

DISCUSSION ----------

The theoretical maximum for the SCSI bus is 5MB per second. The actual aggregate performance is around 4.5MB per second.

Maximum throughput for the 500MB and 1000MB drives on the SCSI DMA port of the Apple Workgroup Server 95 are as follows:

- Reads : 3MB per second
- Writes: 2MB per second

72-Pin SIMMs: Which Macs Support Industry Standard (3/94)

==========

Article Created: 17 August 1993
Article Reviewed/Updated: 25 March 1994

TOPIC ----------

All desktop Macintosh models introduced since February 1993 use 72-pin SIMM slots for their RAM. This type of SIMM is considered an industry standard, and is widely available for other brands of computers.

However, the specification for using these SIMMs with Macintosh computers omits the ninth parity bit, which is part of the so-called "industry standard." Will these SIMMs still work when installed in the new Macintosh models?

DISCUSSION ----------

The ninth parity bit in 72-pin SIMMs installed in Macintosh slots is ignored and should not present any problems. However, it is always best to test a type of SIMM carefully in all banks in any Macintosh models you intend to use.

The SIMMs that work in Macintosh models supporting 72-pin SIMMs are considered industry standard 72-pin SIMMs, but not all "industry standard" SIMMs are guaranteed to work in these Macintosh systems. In other words, these Macintosh models might require the "higher" quality SIMMs that meet industry standards. When purchasing SIMMs, be sure you get 72-pin fast-paged mode with 60ns access time or faster (80ns for the Macintosh LC III).

Be aware that Apple does not support composite SIMMs for the 72-pin SIMM form factor. (Composite SIMMs are SIMMs manufactured using a smaller or older memory technology. An example of this would be a 16MB SIMM made of rows of 4MB chips -- basically a 16MB SIMM made of four 4MB SIMMs on one board. Composite SIMMs are never recommended for use in Apple computers.)

Composite SIMMs: How to Identify (2/95)

==========

Article Created: 17 August 1993
Article Reviewed/Updated: 14 February 1995

TOPIC ----------

Apple recommends against using composite SIMMs in any Macintosh. Apple hasn't tested composite SIMMs, and there are known problems with some CPUs. This article tells you what some of the problems are, and how to identify composite SIMMs.

DISCUSSION ----------

A composite SIMM uses lower density components to construct a single bank of memory. It forms a large memory SIMM using many smaller DRAM chips along with additional bank-controlling circuitry and sometimes buffers for the address and control signals, deceiving the Macintosh memory controller circuitry.

Composite SIMMs are less expensive than non-composite SIMMS because they are made with less expensive components. As an example, a 16 MB composite SIMM would be made up of 32 4-megabit DRAM chips, along with the additional circuitry to control the banks. Conversely, a non-composite 16 MB SIMM would be made up of 8 16-megabit chips only. Composite SIMMs are made up of more commonly available and less expensive parts.

Composite SIMMs pose timing and electrical problems in some Macintosh computers, particularly those optimized for maximum DRAM performance, such as the Quadra 800 and 900 series. Composite SIMMs with signal buffering have caused floppy disk (especially 800K) mounting problems on the Macintosh AV computers. The additional circuitry in the composite SIMMs causes random memory failures due to:

- Higher electrical currents
- Increased system noise
- The added timing overhead (delay)

Composite SIMMs may work under some conditions, but may cause random problems

such as start-up failures, system errors, or unexplained crashes. The errors can vary with different SIMMs, SIMM configurations, and vendors. Two composite SIMMs may work, but four may begin to cause random failures. One CPU might behave differently than the same model manufactured at a different time. Even temperature and supply voltages can cause minute variations.

Some SIMM vendors claim to have solved the loading and timing issues. However, the Macintosh memory system is tuned to expect the loading of standard SIMMs. Apple systems are verified to work with eight memory chips per bank, plus parity chips.

Article Change History:
14 Feb 1995 - Revised description of Composite SIMM.
11 Oct 1994 - Reviewed, made minor changes, added new keyword

Quadra 900 & 950: 256MB RAM & RAM Disk (8/93)

Revised: 8/27/93
Security: Everyone

Quadra 900 & 950: 256MB RAM & RAM Disk (8/93)

==========

Article Created: 18 August 1993

TOPIC -----

We have a Macintosh Quadra 950 loaded with 256MB of RAM. However, we are unable to turn on the RAM Disk feature when the machine has this much memory.

DISCUSSION -----

The MMU (memory management unit) page table is limited to 256K. When you install 256MB of RAM in a Quadra 900 or 950, the MMU page table grows a little too big and overwrites the RAM disk portion of memory. Replacing one bank of the 16MB SIMMs with 4MB SIMMS (reducing the total RAM below 256MB) will allow the system to work correctly with the RAM disk enabled.

Note that Apple does not officially support 16MB SIMMs in the Quadra, although in most situations they will work fine.

LaserWriter Pro: Connecting to a NeXT Computer (8/93)

==========

Article Created: 27 August 1993

TOPIC --------------------

How can I connect a NeXT computer to my LaserWriter Pro 600?

DISCUSSION --------------------

From a hardware standpoint the only requirement for a serial RS232 connection to the printer would be a null modem cable. On an AppleTalk network, you can connect via the printer's LocalTalk port. Use NeXTSTEP 3.0 which reportedly includes an Appleshare client which provides access to PostScript printers on an AppleTalk network.

On the LaserWriter Pro itself, you want to set the thumbwheel switch to position 0 which sets the printer for PostScript, 9600 baud, 8 data bits, 1 stop bit, and XON/OXFF handshaking.

Contact NeXt for more information. To locate a vendor's address and phone number, use the vendor's name as a search string.

Newton MessagePad: Deleting Printers From List (8/93)

Revised: 8/27/93
Security: Everyone

Newton MessagePad: Deleting Printers From List (8/93)

==========

Article Created: 27 August 1993

TOPIC -----

How do I remove a printer from my Newton's print slip (or dialog box)? I've just renamed my Laserwriter, but its old name is still in the print list.

DISCUSSION -----

The print list in the Newton MessagePad can display a total of two printer names, with the most recently selected printer name displayed on top of the list. There is no way to delete a printer from this list.

You can remove a printer name by choosing another printer from either the "Network printers" or "Other printers" selections. This will remove the oldest name from the print list. In your case, this will be the old name of your LaserWriter.

Apple MessagePad: Using Foreign Characters in Word List (5/95)

==========

Article Created: 27 August 1993
Article Reviewed/Updated: 5 May 1995

TOPIC ----------

I can enter words that contain non-English characters (such as "ä", "é", or "ø") into the Apple MessagePad's word list. Why do these words appear without the accent?

DISCUSSION ----------

You can save words with non-English characters to the word list of the U.S. version of the Apple MessagePad. These words, however, are displayed without accents and the Apple MessagePad do not recognize non-English characters when you write them. We recommend that you do not enter words with non-English characters into your word list.

PowerPC Microprocessor Family: An Overview (3/94)

Revised: 3/11/94
Security: Everyone

PowerPC Microprocessor Family: An Overview (3/94)

==========

Article Created: 30 August 1993
Article Reviewed/Updated: 11 March 1994

TOPIC ----------

This article gives an overview of the PowerPC microprocessor family.

DISCUSSION ----------

Apple, IBM, and Motorola are working on four versions of the PowerPC microprocessor simultaneously. Each version is designed to meet the needs of a different segment of the marketplace.

PowerPC 601 (MPC601)

The first microprocessor in the family is the PowerPC 601. The 601 will be in production in early 1994 and will be used in the initial midrange and high-end Macintosh systems.

PowerPC 601 features:

- 32-bit implementation of the PowerPC architecture
- 32-bit address bus
- 64-bit data bus
- Processor bus based on 88110 bus
- Available in two versions: a 66 MHz version and a 80 MHz version.

PowerPC 603 (MPC603)

The PowerPC 603 microprocessor will offer performance similar to the 601 in an even lower-power, lower-cost design. These features will allow Apple to use the 603 in high-volume desktop Macintosh computers and PowerBook models.

PowerPC 603 features:

- 32-bit implementation of the PowerPC architecture
- 32-bit address bus
- 64-bit data bus
- Processor bus based on 88110 bus
- Low power consumption
- Fully static logic with power-saving features
- 3.3 volt design
- Requires only two watts of power during full operation, one watt when only in active use.
- Available in two versions: a 66 MHz version and a 80 MHz version.

PowerPC 604 (MPC604)

The PowerPC 604 microprocessor will eventually replace the 601, allowing Apple to offer even better performance in midrange and high-end Macintosh computers.

PowerPC 604 features:

- 32-bit address bus
- 64-bit data bus
- Bigger pipeline
- Higher parallelism
- Advanced branching techniques for higher performance

PowerPC 620 (MPC620)

The PowerPC 620 microprocessor will be a high-end product offering premium performance and a full 64-bit architecture. It is being designed primarily for high-performance workstations and servers.

PowerPC 620 features:

- 32-bit address bus
- 64-bit data bus
- Multiple levels of parallelism
- Will use a different processor bus

Article Change History:
11 March 1994 - Reclassified article for Power Macintosh intro.
7 December 1993 - Added additional 601, 603 version and power consumption information.

AppleShare Print Server 2.0 Requires Laser Prep File (8/93)

Revised: 8/30/93
Security: Everyone

AppleShare Print Server 2.0 Requires Laser Prep File (8/93)

==========

Article Created: 30 August 1993

TOPIC ----------

Our AppleShare Print Server software no longer runs on a network where all workstations (and by necessity the print server as well) are running the 7.x versions of the LaserWriter drivers.

DISCUSSION ----------

Since AppleShare Print Server 2.0 requires the Laser Prep file, the the Prep file has been updated specifically for AppleShare Print Server 2.0 only. You'll find this updated file on the Printing Tools disk that comes with System 7.x. Replace the file on the print servers in the System Folder with this file. Don't put the Prep file on the workstations, only on the print server.

Note: The Laser Prep file was rolled into LaserWriter Driver version 6.1 and later. The Laser Prep file was required with printer driver versions 6.0 and earlier.

LaserWriters: Differences in HP Emulation (8/93)

Revised: 8/31/93
Security: Everyone

LaserWriters: Differences in HP Emulation (8/93)

==========

Article Created: 31 August 1993

TOPIC ----------

1) Is there a list of PCL 4+ (Printer Control Language) commands supported by the LaserWriter IIg?

2) I would like to find out the differences between HP LaserJet emulation (PCL 4+) on Apple's LaserWriter printers, and the HP LaserJet IIP printer.

DISCUSSION ----------

1) With regard to the list of PCL 4+ commands supported by the LaserWriter IIg, we don't believe that such a list is available. However, as stated in Chapter 3 of the LaserWriter Reference (Addison-Wesley #ISBN 0-201-19258-6),

"With a few exceptions, the LaserJet+ emulator supports the entire set of escape sequences for both the LaserJet and the LaserJet+. This set includes the positioning commands, font-selection commands, and bit-mapped graphics with no limitation on areas covered by bit maps, as well as the rules, macros, overlays, and downloadable fonts."

2) The LaserWriter Reference has a total of about 11 pages that provide specifics on the HP LaserJet+ emulator (PCL 4+).

Appendix D in the LaserWriter IIf and IIg Owner's Guide provides some in-depth information on HP LaserJet+ emulation. The most important section are below:

The LaserJet IIP emulator contained in the LaserWriter allows you to print just about anything you can print on the LaserJet IIP, with these differences:

- The LaserJet IIP omits characters that overlap the left margin of the paper, but the emulator prints the portion of the character that does not extend into the margin.

- The LaserJet IIP allows you to insert commands to halt printing so that you can insert paper or envelopes manually. The emulator interprets those commands as form feeds.

- Applications that produce justified text with the LaserJet IIP versions of Helvetica (Helv) and Times Roman (Tms Rmn) fonts may generate slightly ragged output on the emulator.

- While the LaserJet IIP prints characters in the closest available point size and pitch for each font, the emulator scales the font to the specified size.

- The line printer font, which is 16.67-pitch Courier, appears with a height of 7.2 points when printed with the emulator, rather than 8.5 points as printed by the LaserJet IIP.

- The Control-C and Control-T key combinations, which you can normally use to interrupt printing or query the status of the LaserJet IIP, cannot be used with the emulator.

- The emulator does not print nine characters from the LaserJet IIP Roman-8 symbol set. These characters are shown in the following table.

  Decimal codes: 176, 179, 227, 228, 240, 241, 247, 248, and 254.

Finder and Desktop Manager: How They Work Together (8/93)

Revised: 8/31/93
Security: Everyone

Finder and Desktop Manager: How They Work Together (8/93)

==========

Article Created: 31 August 1993

TOPIC -----

I have two questions about how the Desktop Manager and Finder work together:

1) When does the Finder update the Desktop Manager Files?

2) If there are multiple applications with the same creator, how does the Finder decide which one to use?

DISCUSSION -----

1) The Finder makes Desktop Manager calls when it needs to:

- Add icons to the Desktop database
- Add application information to the Desktop database
- Add "Get Info" comments for a file to the Desktop database
- Remove application information from the Desktop database
- Remove "Get Info" comments for a file from the Desktop database
- Get an icon or icon information from the Desktop database
- Find an application
- Get the "Get Info" comments for a file
- Rebuild the Desktop database

For more detailed information, please read pages 9-44 to 9-66 of Inside Macintosh Volume VI.

2) The Finder, using the call PBDTGetAPPL, will find and use the application with the most recent creation date. If two or more applications have the same creation date, the most recently added application in the Desktop database will be used.

LaserWriter Driver 8.x: How Auto Select Works (4/97)

Revised: 4/14/97
Security: Everyone

LaserWriter Driver 8.x: How Auto Select Works (4/97)

==========

Article Created: 31 August 1993
Article Reviewed/Updated: 14 April 1997

TOPIC ----------

I have had problems using the Auto Select feature of LaserWriter Driver 8.x. The Auto Select option in the Print dialog seems to be ignored randomly, or used randomly when not asked for.

DISCUSSION ----------

This article explains the LaserWriter Driver 8.x "Auto Select" feature. However, when following the information presented here, you must first make sure that "Auto Select" is selected as the paper source in the LaserWriter 8.x Print dialog.

Installed and Preferred

This setting only affects print jobs coming from the Macintosh you "Configure". Either the 250-sheet or 500-sheet cassette can be chosen as the default paper tray by selecting the printer in the Chooser, clicking on Setup, and then on Configure. Once the Configure dialog box displays, the 500-sheet cassette can be set for Installed and Preferred, which makes it the default paper tray for that paper size. Thus, if there is Legal-sized paper in the 500-sheet tray, then any Legal-sized print job uses the 500-sheet cassette. If the 500-sheet cassette is set only as Installed, then the default paper tray used is the 250-sheet cassette (for all jobs using the paper size installed in that cassette).

To access the Configure dialog box with LaserWriter Driver 8.2 or greater, you must click on Setup once to select the PostScript Printer Description (PPD) file, and then click on Setup again to get the option for Configure.

PostScript and Default Paper Tray

This affects ALL print jobs coming from ANY Macintosh since the value is modified at the printer, not the client (as in the preceding Installed and

Preferred procedure).

You can set any of the paper trays (Multipurpose, 250-sheet, 500-sheet, or Envelope) as the default paper tray by downloading the PostScript code (see PostScript Code on page 10) to the printer. The default tray selected is used automatically for any print jobs of the same paper size as in the default tray that you set.

PostScript Code

Use this PostScript code at your own risk. You are responsible for the support of any problems associated with changing the default tray. You should also inform others using the printer that you have changed the default tray. Changing the default tray on the printer may cause the paper out LED to light if there is no paper present in the default tray, or if the wrong size paper is used in the tray. When this happens, there is nothing wrong with the printer's hardware.

This is PostScript Level 1 code:

```
%=============================================================
% Begin PostScript Code
%
serverdict begin 0 exitserver
statusdict begin 1 setdefaultpapertray end
%
% end PostScript Code
%=============================================================
```

VALUE	TRAY SELECTION
0	250 sheet cassette
1	Multi-purpose tray
2	500 sheet cassette
3	Envelope tray

NOTE: The VALUE column pertains to the integer preceding the setdefaultpapertray command on the second line in the PostScript code.

This is the equivalent PostScript Level 2 code:

```
%=============================================================
% Begin PostScript Code
%
serverdict begin 0 exitserver
1 dict dup /InputAttributes 1 dict dup /Priority [2 1 0] put put setpagedevice
%
% End PostScript Code
%=============================================================
```

This sets the paper tray priority to:
1st Priority - Cassette (500 Sheets) - designated by the "2" in the array above.

2nd Priority - Multipurpose Tray - designated by the "1" in the array above.
3rd Priority - Cassette (250 Sheets) - designated by the "0" in the array above.

You can change the paper tray priority order by changing the values in "/Priority [2 1 0]".
For example, /Priority [0 1 2] makes the 250 sheet cassette first priority, then the Multipurpose tray next, then the 500 sheet cassette.

WARNING: If you choose to use the PostScript code provided in this article, you assume all risks involved in making these changes. PostScript code, if not entered correctly, can place the LaserWriter into a condition requiring service.

Individual Documents

Tray selection is NOT stored with each individual document, however, page size is. Thus, with "Auto Select" the LaserWriter driver does its best to match the page size with the appropriate tray, depending on how the printer was configured using the preceding procedures.

Sticky Trays?

LaserWriter 8.x DOES NOT automatically use (for the next job) the last paper tray used in the previous job, unless the current print job is of the same paper size as the previous job.

This article was published in the "Information Alley":
Volume II, Issue 4, Page 9

Article Change History:
14 Apr 1997 - Added PostScript Level 2 code.
14 Jun 1995 - Added Info Alley information; made several technical updates.
21 Apr 1995 - Added additional information to Caution message.

QuickDraw, Color QuickDraw, 32-Bit QuickDraw, and QuickDraw GX

Revised: 1/6/94
Security: Everyone

QuickDraw, Color QuickDraw, 32-Bit QuickDraw, and QuickDraw GX

==========

Article Created: 30 August 1993
Article Reviewed/Updated: 6 January 1994

TOPIC --------------------

This article explains the relationship of QuickDraw, Color QuickDraw, 32-bit QuickDraw, and QuickDraw GX.

DISCUSSION --------------------

QuickDraw

QuickDraw shipped with the original Macintosh computers. It's in every Macintosh computer, and consists of drawing commands used by windows, menus, and dialogs as well as the usual graphics drawing such as the old MacPaint programs. It's sometimes called original QuickDraw.

QuickDraw supports only 8 colors: black, white, cyan, magenta, blue, green, yellow, and red; although most programs that use only original QuickDraw draw in black and white. There are two reasons for this:

- The original Macintosh computers didn't have color displays, so color seemed useless (unless you were printing).

- There are limitations to what you can do with color under original QuickDraw.

Color QuickDraw

Color QuickDraw first shipped with the Macintosh II, and is in every Macintosh II class computer, (which includes the SE/30). Color QuickDraw supplements QuickDraw by adding new color support. With Color QuickDraw, you can create and display incredible color images, among other things.

At this time Apple also introduced hardware for color displays. Most of the color PICT files you see today were made with Color QuickDraw. Color QuickDraw also makes it possible to have color menus, color windows, icons, and so forth. Most of the "graphical" toolbox routines were revised to support the color enhancements.

Notes: Inside Macintosh V talks about Color QuickDraw. So does Inside Macintosh VI, but they are completely different. What Inside Macintosh VI calls Color QuickDraw is really 32-bit QuickDraw.

The Color QuickDraw 1.2 INIT that shipped with system software 6.0.5 can't be used on computers prior to the Macintosh II or SE/30 (like the Plus, SE, or Classic) because there's no Color QuickDraw on board.

32-Bit QuickDraw

32-bit QuickDraw first shipped as an INIT with system 6.0.5. It supplemented Color QuickDraw, and therefore required Color QuickDraw to be present. Now every Color QuickDraw computer Apple creates also has a version of 32-bit QuickDraw in ROM. 32-bit QuickDraw was an enhancement for Color QuickDraw in that it made it easier to create graphics, and had additional graphics operations.

Any CPU with Color QuickDraw, and either 32-bit QuickDraw in ROM or the 32-bit QuickDraw INIT running, as well as any CPU running system 7 supports 32-bit QuickDraw.

A factor introduced with system 7 was the provision of 32-bit QuickDraw support on any computer. Although what occurs on a non-color QuickDraw computer (like the Classic) is a hybrid of true 32-bit QuickDraw. In any case, System 7 supports all the calls.

Therefore System 7 gives 32-bit QuickDraw and Color QuickDraw support to computers prior to the Macintosh II or SE/30. This doesn't necessarily give color capability to these systems -- but allows software that makes calls to 32-bit QuickDraw or Color QuickDraw to operate without crashing. System 7 also gives the Macintosh II, IIcx, IIfx, LC, LCII and computers with 32-bit QuickDraw in ROM (such as Macintosh IIci) a less buggy version of QuickDraw, with some additional features. Just as system software evolves, so does the underlying graphics software. The latest version will always be in the latest system software release.

QuickDraw GX

QuickDraw GX is the next evolution of QuickDraw. Like Color QuickDraw and 32-bit QuickDraw, it co-exists with the previous versions of QuickDraw, although it no longer requires them. However, GX requires system 7.1, so you'll automatically have 32-bit QuickDraw and Color QuickDraw support built in.

To summarize:

- You always have QuickDraw in a Macintosh.
- If you have Color QuickDraw, you also have QuickDraw.
- If you have 32-bit QuickDraw, you also have Color QuickDraw and QuickDraw.
- If you have system 7 you have 32-bit QuickDraw and Color QuickDraw support as well as QuickDraw (the actual code executed is different than the usual 32-bit QuickDraw).
- QuickDraw GX provides QuickDraw and some version (either true or a hybrid) of 32-bit QuickDraw and Color QuickDraw as well.

And just to be clear, the different types of QuickDraw can all be used together. You can ALWAYS intermix the calls, as long as they're supported by the system you're using.

Article Change History:
30 November 1993 - Clarified what System 7 does for systems prior to the Macintosh II and SE/30.
6 January 1994 - Reworded QuickDraw GX information.

ABS Tech Note: AS01 AppleSearch Character Support (8/93)

Revised: 5/21/96
Security: Everyone

ABS Tech Note: AS01 AppleSearch Character Support (8/93)

==========

Article Created: 31 August 1993

TOPIC --

As with most information retrieval applications, AppleSearch deals with a variety of language and character rules in order to function properly. This note will outline the AppleSearch character support for version 1.0.Note that our search engine is licensed from Personal Library Software.

DISCUSSION --

Summary

For version 1.0 of AppleSearch, we are supporting the US English Character Set, with some mapping exceptions as defined below. Technically, we are 7-bit compatible, but 8-bit aware.

We've defined our character support based on the Inside Mac Volume VI definition of the Roman Character set; Appendix E: The Standard Roman Character Set.

The server software "handles" accented and double characters in a limited fashion. Accented characters are mapped to their US English counterpart, for example, é to e, å to a. AppleSearch makes no distinction between accented and non-accented characters. This mapping is consistent between indexing and searching. For example, while indexing the word "élève" would be changed to "eleve". When you search for the word "élève", it would be changed to "eleve", before searching the index.

Double characters are mapped to the first letter, for example, œ to o, æ to a. This may seem odd, but our options were to:

- Store the character
- Map it to a space
- Map it to a 7-bit equivalent

We have chosen to map characters with accent marks and double characters to their 7-bit equivalent for the following reasons:

- Staying 7-bit clean today, will ensure compatibility between future 8-bit releases and version 1.0 index files.

- Users may get false hits when using languages where diacritical marks change the meaning of a word. However, for languages where the grammatical rules for diacritical marks are not very rigid, it is better to compare words after stripping diacritical marks. You may get false hits, but you'll not miss any documents.

Note

Download this document, open with your favorite word processor, and change the font to either Courier, Palatino, or Times to read all the characters below.

At Ease 1.x Loses Aliases to Servers (8/95)

==========

Article Created: 30 August 1993
Article Reviewed/Updated: 14 August 1995

TOPIC ----------

I'm using At Ease 1.x in a laboratory of computers containing a file server. When a student clicks on a button in At Ease for an item located on the file server, a message prompts to log in. If the user account doesn't have access privileges to the item, an error will appear that the alias can't be opened, because the original item can't be found. The button is then removed from the At Ease screen. The administrator then has to go back into At Ease and set the button up again.

DISCUSSION ----------

Version 2.0 of At Ease doesn't have this problem. Upgrade to At Ease 2.0. This problem has been confirmed in all versions of At Ease 1.x

If you use At Ease in conjunction with a file server, consider At Ease for WorkGroups, which will offer much more flexibility. There's no upgrade from 1.x to At Ease for Workgroups.

Arabic System: Which LaserWriter Printer Driver? (9/93)

Revised: 9/1/93
Security: Everyone

Arabic System: Which LaserWriter Printer Driver? (9/93)

==========

Article Created: 1 September 1993

TOPIC --------------------

I bought an Arabic 7.1 system (WorldScript) and a LaserWriter Select 310. Does this system require the Arabic version of the LaserWriter Select 310 printer drivers or will the UK or international printer drivers work?

Are localized printer drivers required to match the localized versions of system software?

DISCUSSION --------------------

The Arabic version of the LaserWriter Select 310 print driver is not a requirement for using the printer with Arabic System 7.1. We are not sure about "compatibility" with the UK version of the print driver, however, the international Z-version will work just fine with the Arabic system.

Essentially, the localized print drivers such as the Arabic version contain localized strings (Page Setup and Print dialog boxes with Arabic instead of English words), installer scripts, and paper size selections available in the respective country. The Z-version has English strings for the user interface, though contains the region-specific paper size selections, as well as modified installer scripts to accommodate the various script systems.

Fonts: Location Relative to Version of Operating System (2/95)

==========

Article Created: 1 September 1993
Article Reviewed/Updated: 15 February 1995

TOPIC ----------

The chart below describes where to properly place fonts relative to the version of the operating system in use.

DISCUSSION ----------

	Bitmap	PostScript	TrueType
System 6.x	Use Font/DA mover to install fonts into System file	System Folder	System file * (see below)
System 7.0 and System 7.0.1	Drag to System file **	Extensions folder **	System file **
System 7.1	Font folder **	Font folder **	Font folder **
System 7.5	Font folder **	Font folder **	Font folder **

. ----------

NOTE
* TrueType fonts don't work with system software version 6.0.4 or earlier and versions 6.0.5 through 6.0.8 require the TrueType INIT.

** System 7.0, System 7.0.1, and System 7.1 will automatically place Bitmap, PostScript, and TrueType fonts in the proper locations when they are dragged to the System Folder.

GeoPorts: How to Fix Disconnect Problem (9/93)

Revised: 9/10/93
Security: Everyone

GeoPorts: How to Fix Disconnect Problem (9/93)

==========

Article Created: 2 September 1993

TOPIC ----------

I have problems with GeoPorts connecting to services and disconnecting immediately. The software on the update for the Express Modem is supposed to work with the GeoPort.

DISCUSSION ----------

You should use the software that comes with the GeoPort Telecom Adapter. The Express Modem Software 1.1.2 is compatible, but there's much more software installed by the GeoPort Express Modem Installer than by the normal one. Software installed includes the Shared Library Manager, ASLM Resources, GeoPort Extension, GeoPort Telecom Adapter, and GeoPort Telecomm. Without these files, you can't use the GeoPort Telecom Adapter.

If you installed the proper software, and still experience problems with disconnects or aren't connecting at all, try turning off error correction. You can do this with the modem command: &Q0 in the modem string.

ABS Tech Note: AWS01 File/Print Server for 4th Dimension (1/94)

Revised: 1/11/94
Security: Everyone

ABS Tech Note: AWS01 File/Print Server for 4th Dimension (1/94)

==========

Article Created: 23 December 1993

TOPIC --------------------

This technical note advises you to choose the Apple Workgroup Server (AWS) 95 File/Print server platform for 4th Dimension.

DISCUSSION --------------------

With the release of the AWS 95 there has been confusion with respect to guiding customers towards selecting the proper platform for their specific needs. In a number of instances the database version of this product has been selected when what the customer required was really the File/Print Server.

ACIUS Inc. is shipping their version of the 4th Dimension server. It will be important to make sure that people who want to obtain this product combination understand that the proper platform is the File/Print Server and not the database server product.

ABS Tech Note: AWS02 AWS95 SCSI Termination (1/94)

==========

Article Created: 23 December 1993

TOPIC --------------------

This technical note describes SCSI termination on the Apple Workgroup Server (AWS) 95.

DISCUSSION --------------------

The introduction of the AWS 95 has led to questions with regard to the SCSI termination requirements for the internal Processor Direct Slot Card and the SCSI busses that it supports. The internal and external SCSI buses on the AWS 95 are two separate electrical buses that are logically treated as one via software. This means external cabling and termination issues do not affect the internal bus and vice-versa. Both buses are terminated at the main board. The second termination point for the internal SCSI bus is built-in to the end of the internal SCSI cable, and the second termination point for the external SCSI bus is provided via a terminator connected to the last device on the external SCSI chain.

The AWS 95 retains the same termination scheme on the main board and on the PDS card for a total of four electrically separated SCSI buses. The two buses attached to the PDS card are terminated at the PDS card. The second termination point for the internal PDS SCSI bus is built-in to the end of the internal SCSI cable, and the second termination point for the external PDS SCSI bus is provided via a terminator connected to the last device on the external PDS SCSI chain.

ABS Tech Note: AWS08 kconfig Defaults & Deltas (6/94)

==========

Article Created: 23 June 1994

TOPIC ----------

This article describes Kernel parameters (kconfig) defaults & deltas for the Apple Workgroup Server (AWS) 95 File/Print and Database Server Configurations.

DISCUSSION ----------

This technical note documents the default Kernel parameters settings for the File/Print and Database server Configurations under A/UX version 3.0.1 and 3.1 and how they are different from A/UX version 3.0. It also describes the new configuration parameters introduced in A/UX version 3.0.1 and their default settings.

Kernel Configuration Defaults

Variable	File/Print	Database	3.0 Defaults
MAXSC	32	32	8
NBLK16	256	256	128
NBLK64	800	800	64
NBLK128	256	256	32
NBLK256	256	256	16
NBLK512	128	128	8
NBLK1024	300	300	8
NBUF	-1	0	0
NCALL	500	150	75
NFILE	7500	1024	256
NINODE	7500	1024	256
NMOUNT	32	32	10
NPBUF	64	64	20
NQUEUE	1200	1200	256
NSTREAM	200	200	32
SBUFSIZE	4096	4096	2048

Kernel Configuration Parameters Introduced in 3.0.1

Variable	Description	Default
GNOFILE	Global File Table (used by Mac environment)	6144
MSGMAP	Message Map Entries (used by msgop(2))	200
MSGMAX	Maximum Message Size (used by msgop(2))	8192
MSGMNB	Max. Message Queue Size (used by msgop(2))	16384
MSGMNI	Message Queue Identifiers (used by msgop(2))	50
MSGTQL	Number of Message Headers	200
NASIOD	Number of Asynchronous I/O Daemons	4
NASIOQ	Asynchronous I/O Request Queue	128
SEMMAP	Semaphore Map Entries (see semop(2))	50
SEMMNI	Semaphore Identifiers (see semop(2))	50
SEMMNS	Total Number of Semaphores (see semop(2))	300
SHMMNI	Shared Memory Segment Identifiers (shmop(2))	100

For more information on kernel parameters, refer to the on-line man page for kconfig.

In release 3.1, the behavior of the system has changed when NBUF is set to -1. The new algorithm for determining the size of the buffer cache is:

```
  if (v.v_buf == -1) {
      /* if < 20Mb available just allocate 10% for bufs */
      if (availmem <= 5120)
           m = availmem / 10;
      /* else if < 40Mb available, reserve 20Mb for procs */
      else if (availmem < 10240)
           m = availmem - 5120;
      /* else split 50/50 */
      else
           m = availmem / 2;

      /* make sure we've got at least 10% for the bufs */
      if (m < (availmem / 10))
           m = availmem / 10;

      v.v_buf = ptob(m) / v.v_sbufsz;
  } else if (v.v_buf == 0)
      v.v_buf = ptob(availmem) / (10 * v.v_sbufsz);
```

ABS Tech Note: AWS09 A/UX Buffer Cache Q&As on AWS 95 (6/96)

Revised: 6/3/96
Security: Everyone

ABS Tech Note: AWS09 A/UX Buffer Cache Q&As on AWS 95 (6/96)

==========

Article Created: 23 June 1994
Article Reviewed/Updated: 3 June 1996

TOPIC ----------

This technical note discusses the buffer cache on the Apple Workgroup Server 95, how it affects performance and how to tune your buffer cache to maximize performance.

DISCUSSION ----------

Question: What is Unix buffer cache and how is it related to performance?

Answer: Typically, the I/O buffers, or call it cache, store the most recently fetched information from block I/O devices, primarily disk drives. So in general, increasing the number/size of cache increases the chance that commonly accessed data will be in the cache, thereby increasing performance. However, it also reduces the free memory in the system, which increases the probability that the system will run out of physical memory and begin paging or swapping.

If the system commonly has free memory available, and/or if the applications have SMALL memory requirements, the cache size can be increased quite a bit.

If the application is NOT dependent on performance or A/UX is being used as a workstation then, the application should probably use the default cache size, though the cache could be adjusted up or down depending on many factors such as the nature of application, number of processes, file system size etc.

Adding more system RAM definitely gives more flexibility and freedom in terms of using more RAM to cache and thereby affecting the performance, by increasing the probability that the items will be in the cache.

Question: How can proper cache sizing be achieved?

Answer: A/UX buffer cache sizing on A/UX 3.0.1 and later releases may be

achieved through Unix or by the Macintosh memory CDEV. There has been an enhancement made to the Macintosh Memory Control Panel Device (CDEV) to permit viewing and sizing of A/UX buffer cache, the Unix analogue of Macintosh's disk cache, in A/UX Version 3.0.1.

Using this facility, you can set the A/UX buffer cache in the Memory CDEV, located in the Control Panels folder under the Apple Menu. The Cache Size shows the current buffer cache size in use by the running kernel. If the user changes the cache size with the slide control, it will not be changed in the running kernel, until the memory CDEV is closed and the system is rebooted.

The traditional UNIX way, checking and changing the buffer cache size which is the function of the kernel's NBUF and SBUFSIZE parameters, requires you to use commands such as kconfig -a -n /Unix | grep NBUF. Since using kconfig can be confusing and prone to errors if kconfig adjustments are done incorrectly, this enhancement enables you to change the buffer cache through the memory Control Panel, and the system ensures the buffer cache size stays within acceptable limits.

In addition, A/UX 3.0.1 supports static and dynamic cache sizing.

In dynamic cache sizing, the kernel uses an algorithm to size the buffer cache as it boots, based on the value of NBUF=0 or -1 and SBUFSIZE.

NBUF=0

Set the cache to 10% of memory available at boot time.

NBUF=-1

See AWS08 for details on how the buffers are allocated.

In static cache sizing, the buffer cache is set to NBUF * SBUFSIZE bytes, based on the value of NBUF > 0, unless such a cache would be greater than 90% of available memory then it resets to 10% of available memory.

Question: What is the cache setting for the default File/Print as well as database configuration?

Answer: The AWS95 software comes in two flavors, one for the file/print server configuration and the other for database server configuration.

The manual "Tuning Server Performance and Adding Internal Hard Drives" shipped with release 3.1 has details on how to configure the server.

Question: What A/UX cache settings will optimize server performance?

Answer: As a default configuration, the file/print server version of A/UX sets NBUF to -1 and SBUFSIZE to 4096, and the database server version of A/UX sets NBUF to 0 and SBUFSIZE to 4096.

In general, an A/UX system acting as a file/print server, should have a fairly large buffer cache. A/UX systems running only database applications that access disks through raw devices should have a small buffer cache. More detail can be found on this in technical note AWS03.

For more information on A/UX buffer cache, please search the Technical Information for article, "Workgroup Server 95: Cache Optimization, Basic Formula".

ABS Tech Note: AWS10 Apple Workgroup Server 95 Q&A (4/95)

==========

Article Created: 14 November 1994
Article Reviewed/Updated: 18 April 1995

TOPIC ----------

This article is the ABS Technical Note, AWS10 Apple Workgroup Server 95 Q&A.

DISCUSSION ----------

Product Information

Question: What is the relative positioning of the Apple Workgroup Servers and AppleShare family of products?

Answer: The Apple Workgroup Server 60 runs AppleShare 4.0, uses System 7.1, and is targeted at small business and classroom lab environments.

The Apple Workgroup Server 80 runs AppleShare 4.0, uses System 7.1, and is targeted at medium-sized business environments and addressing communications server (that is Internet Router, SNA•ps, X.25, X.400 gateways) needs.

The Apple Workgroup Server 95 runs AppleShare Pro, uses A/UX 3.1 as the server operating system, and is targeted at large or data-intensive workgroups. The AWS 95 is also ideal for running relational database (RDBMS) products such as Oracle7 Cooperative Server.

Question: What is the positioning of the AWS 95 and AppleShare Pro against its competitors?

Answer: The AWS 95 with AppleShare Pro is a high-performance AppleShare file and print server. It is designed for Macintosh-mostly AppleTalk workgroups. Therefore, it is best to position it against AppleShare 3.0 as opposed to Novell NetWare or UNIX-based file/print solutions. AppleShare Pro on the AWS 95 has 4 times the throughput of AppleShare 3.0 on a Quadra 950 and will be up to 4 times faster for many operations. The AWS 9150 is somewhat below the AWS 95, while the

8150 is below that and about the same as a 8150, and AppleShare 4.0.2 on a AWS 60 will be close to performance of a 6150.

For those customers who thought that they needed to move to Novell NetWare or a UNIX-based AFP server to satisfy the performance needs of their Mac-mostly workgroup, the AWS 95 running AppleShare Pro is an ideal choice.

Question: What third party applications are available for the Workgroup Server 95?

Answer: Apple Business Systems has published a Workgroup Server Solutions Guide that details many of the third party client-server solutions available for Apple servers today. The solutions guide can be ordered from Apple Starting Line (S.LINE.ORDER). The phone number is 1-800-825-2145 and the cost is $6.25 per copy. Apple Starting Line is located in Colorado.

General Issues

Question: How does the AWS 95 fit into an AOCE environment?

Answer: Although the AOCE server will not run on A/UX 3.1, there are some advantages to having AOCE on a Mac OS-based server in the network with an AWS 95. The primary advantage is the "key chaining" concept which allows a single network logon.

Question: How do we setup the server if we want to use 4D Server?

Answer: 4D Server performs optimally when run with a large A/UX Buffer Cache and a large Macintosh virtual memory partition (at least 16 MB of real RAM). Therefore, 4D Server should be run in one of the three file/print configurations (as opposed to the database configurations) although it does not require AppleShare Pro.

Question: What type of caches are used by the on the AWS 95?

Answer: There are 3 levels of caching on the server: hardware, OS, and software. The hardware cache is called a Level 2 cache and is basically just fast RAM (15 ns). The OS cache, also called the A/UX Buffer Cache, is a backing cache for the entire file system. This means that all applications, including the local Finder, can take advantage of this cache. Files will remain in this cache until they are pushed out by another file. Therefore, the larger the buffer cache, the more likely a commonly used file will remain in the cache, and the better the performance will be. The AppleShare cache comes in 3 flavors: File Cache, Directory Cache, and Icon Cache. The Directory and Icon Caches store information found in the desktop database and information about file sizes, mod dates, and so on. Therefore, these caches are helpful in improving the navigation of the file system (especially with the Finder). The File Cache allows the server to "read ahead" and "write behind". An AppleTalk network sends data across the network in very small packets (about 4K). Since it is very inefficient for a

server to continually go to disk for 4K chunks of data, the read-ahead cache gathers larger blocks of data (up to 128K) before sending it across the network. The write-behind cache does the same for writes by buffering data in the server's RAM before writing to disk. This greatly improves I/O efficiency thereby improving performance.

Question: What kind of network cabling systems are supported on the AWS 95?

Answer: The AWS 95 currently supports Ethernet and LocalTalk cabling systems. It does not currently support Token Ring networking interfaces. A third-party FDDI card manufacturer has announced FDDI support for the AWS 95 and A/UX.

AppleShare Issues

Question: Is there a way to import User Names, Groups, and Passwords from a text file to a File/Print AWS 95?

Answer: Third party developers of AppleShare management program, such as TechWorks, are incorporating tools for importing Users and Groups from text files into their products. These products will allow administrators to create text files in a specific format that can be transformed into a Users and Groups data file.

Question: Is the AppleShare Pro client software backwards compatible? Will it affect those users who try to access an AppleShare 3.0 server?

Answer: AppleShare Pro includes version 3.5 of the AppleShare Workstation. We chose the version number 3.5 so that it could live independently of the AppleShare version that it is bundled with. Workstation 3.5 is merely a bug fix of older AppleShare Workstations and is fully compatible with older versions of AppleShare. And, older versions of the AppleShare Workstation are fully compatible with AppleShare Pro. However, we recommend that users upgrade to the latest release.

Question: Can I run AppleShare Pro on any other Macintosh or Workgroup Server platforms?

Answer: AppleShare Pro will only run on the AWS 95. However, AppleShare 4.0 is essentially the same product as AppleShare Pro and is shipping now. AppleShare 4.0 uses all of the same caching algorithms as AppleShare Pro and runs on the following 6 platforms: Workgroup Server 60, Workgroup Server 80, Centris 610, Quadra 700, Quadra 800, and Quadra 950. Remember, AppleShare Pro gets some of its performance improvements from its own caches, but the rest comes from A/UX and the AWS 95 PDS card. AppleShare Pro 4.0.1 is required to operate on the RISC-based servers.

A/UX Issues

Question: What is the "Mac environment" in A/UX? How large is it?

Answer: The Mac environment (or virtual Macintosh) is a UNIX process that provides the operating system services required by Macintosh applications. These services include the System 7.0.1 Toolbox, so any well-behaved, 32-bit clean, System 7-aware application can run on the AWS 95 (A "well-behaved" application does not access hardware directly; the A/UX security model prevents user-level access.). The default size of the Mac environment is 16 MB in all configurations, but all UNIX processes run in virtual memory so the available memory can be much larger. This default size of the Mac environment can be changed using the "Virtual Memory" setting in the Memory Control Panel.

Question: How is RAM allocated in A/UX for a File/Print configuration?

Answer: The UNIX kernel and core processes take approximately 7 MB of RAM. The remainder of dynamic RAM is divided between the buffer cache and the applications (like the Mac environment). There is also 51 MB of swap space available for virtual memory for UNIX processes. So, for a 32 MB configuration, 7 MB would be used by the Kernel, leaving 25 MB of dynamic RAM (and 51 MB of swap space). The A/UX Buffer Cache would then take 9 MB, leaving 16 MB of real RAM for UNIX processes. The Mac environment would then look for 16 MB of RAM, taking 16 MB of dynamic RAM and 2 MB of swap space. This would then leave 51 MB of swap space for other UNIX processes. The only caveat here is that the Mac environment does not allocate dynamic RAM for unused portions of it's 16 MB heap. Therefore, if only a portion of the 16 MB Mac Partition is being used at any one time, the remaining dynamic RAM will be available for other processes and Mac applications started later may wind up using swap space. See pages 8-10 of Chapter 2 of the Tuning Server Performance guide for more details.

Question: What about the Database configuration?

Answer: Since high-end databases like Oracle7 may maintain their own file system, they may not need a large buffer cache. Therefore all available dynamic RAM, not used by the Kernel, buffer cache, and the Mac environment, are used by Oracle 7.

Question: What version of AppleTalk runs on the Workgroup Server 95?

Answer: The AWS 95 uses a special version of AppleTalk, designed to run on A/UX. The version will report version 56 when polled but is actually compatible with the latest AppleTalk version 58. Do NOT try to install the latest Mac OS version of AppleTalk from the Network Software Installer (NSI) as it is not compatible with A/UX.

Hardware

Question: Describe the second-level memory cache on the AWS 95.

Answer: The second-level memory cache, which allows the microprocessor to gain

significantly faster access to frequently accessed data or instructions, is located on the AWS 95 Processor Direct Slot (PDS) card. The cache uses 15 ns static RAM. 128 KB is on-board the PDS card. The second-level memory cache is expandable to 512 KB via SIMM upgrade kits. The second-level cache is a write-through, direct-mapped cache.

Question: Describe the SCSI DMA channels on the AWS 95.

Answer: Two SCSI DMA (Direct Memory Access) channels are located on the AWS 95 PDS card. SCSI DMA allows for more efficient data transfers between SCSI devices and DRAM (because data transfer is managed by the SCSI controller and SCSI DMA control logic instead of the microprocessor).

Question: How many SCSI devices can be attached to the AWS 95, and why?

Answer: Up to 20 SCSI devices can be attached to the AWS 95.
• Up to 7 SCSI devices can be attached to the PDS card's external SCSI port.
• Up to 7 SCSI devices can be attached to the main logic board's external SCSI port
• Up to 6 internal SCSI devices can be attached to the PDS card's internal SCSI port. NOTE: in order to attach 6 internal SCSI devices, special carriers would be required such as the 5 drive bracket for the AWS 95.

Question: Is the SCSI interface on the AWS 95 SCSI-1 or SCSI-2?

Answer: The SCSI interface is still SCSI-1. However, the AWS 95 supports the following SCSI enhancements:

Connect/disconnect is supported by A/UX and is available on all 4 SCSI channels. The benefit is more efficient use of SCSI bus (less contention). A SCSI device can momentarily disconnect from the SCSI bus while it is executing a time consuming operation (that is a full stroke seek on a CD-ROM drive). This permits other devices on the bus to execute SCSI commands until the slow device reconnects when it has data available for the initiator of the SCSI command. Applications such as Retrospect A/UX make good use of this feature.

Active termination and active negation technology is supported on the 2 SCSI DMA channels on the PDS card. The benefit is enhanced SCSI signal quality/integrity on the SCSI bus.

SCSI controllers on the PDS card are clocked at 33MHz.

SCSI performance is more efficient because of a combination of A/UX's asynchronous I/O capabilities and the hardware SCSI DMA. Multiple tasks can be queued up and data transfers finish quicker with SCSI DMA.

Question: Does the AWS 95 support fast or wide SCSI-2 options or synchronous transfers? Is there RAID support for the AWS 95?

Answer: The AWS 95 does not currently support either fast or wide SCSI-2 options. Synchronous transfers are also not currently supported. Work is being done with 3rd party providers for SCSI-2 options and RAID solutions. For more 3rd party information, please refer to the Apple Workgroup Server Solutions Guide.

Question: What kind of DRAM can I use with the AWS 95?

Answer: The AWS 95 ships with 4 MB parity DRAM (4 X 9), but non-parity DRAM can also be used (that is 1 X 8, 4 X 8, 16 X 8). The DRAM must be at least 80 ns and you add DRAM in the same way as you would for the Quadra 900/950 (that is you must fill a bank of 4 SIMM slots at a time, with the same DRAM density for each of the SIMMs in the bank). IMPORTANT: if you "mix and match" parity and non-parity DRAM in the AWS 95, make sure that parity checking is disabled in A/UX. To enable or disable parity checking, you should take the following steps, you should, from the Finder, choose Restart from the Special menu. Then, cancel the A/UX Startup process by either clicking the Cancel button or pressing Command-Period while the "Welcome" box is displayed. As a result, the A/UX Startup window opens and the Preferences menu appears in the menu bar. Choose General from the Preferences menu which gives you the check box for memory parity checking.

For more information, refer to Chapter 3, 'Configuring the Software' of "Setting Up and Managing Your Server" manual.

Question: How much data can the DDS-DC 4mm tape drive (sometimes called a DAT drive) back up?

Answer: The Digital Data Storage-Data Compression (DDS-DC) 4mm tape drive can typically back up 4-6GB of compressed data on a 90m tape. Exactly how much data can be backed up depends on the type of data being backed up. The DDS-DC drive can back up 2GB of uncompressed data.

Question: How should hard drives be formatted when they are attached to the AWS 95?

Answer: Hard drives should be formatted as UFS (Unix File System) drives instead of HFS drives. Be sure to use the A/UX version of HDSC Setup. This special version of HDSC Setup will automatically create a mount point for the hard drive.

Troubleshooting

Question: Why does the file system get "dirty" if the server is not shut down gracefully (that is, a power interruption)?

Answer: High performance servers gain most of their performance from caches. However, the data in the cache may not be the same as the data on the disk. It's the servers ability to schedule the writes to disk at a later time that gives

the server a big performance boost. The side affect of this is that losing power before the caches are flushed can cause inconsistencies in data or even lost data. The FSCK (file system check) utility in UNIX allows the file system to rebuild itself and minimizes the possibility that data has been lost.

Question: Are there any guidelines in using or adding INITs and CDEVs to the A/UX Macintosh virtual machine?

Answer: Be extremely careful when using INITs or CDEVs that may be considered "hacks" and bypass the Macintosh toolbox interface. For example, applications such as SCSI Probe and Norton Utilities are not compatible with A/UX.

Question: I have been trying to remove INITs from A/UX by holding down the <shift> key as I do with Mac OS, but it doesn't seem to work, what am I doing wrong?

Answer: This works but is a question of timing. The <shift> key should ONLY be pressed after A/UX has loaded and is about to start up the Macintosh environment (that is, you see a spinning watch come up and the white menu bar is displayed). You have about 5 seconds to start holding down (and keep holding down) the <shift> key. INITs will not load, and the you can then go into the System Folder and remove the incompatible INIT.

Question: How do I rebuild the desktop with the Apple Workgroup Server 95, for example, if my icons become generic icons and the desktop needs to be rebuilt?

Answer: Right after A/UX has loaded and is about to start up the Macintosh environment (that is, you see a spinning watch come up and the white menu bar is displayed), press the <option> and <cmd> keys simultaneously and keep them depressed until you are asked via a dialog box if you want to rebuild the desktop or not.

Question: Why should I avoid pushing the RESET button on the AWS 95?

Answer: Reset the AWS 95 via the front reset button only as a last resort. If certain commands, such as hard disk writes, are occurring when there is a hardware reset, A/UX may detect a corrupted file system, and you may need to go into the A/UX Command Shell to manually check and/or rebuild the file system. Refer to the question above on 'dirty' file systems.

Question: How do I check or rebuild the file system?

Answer: If A/UX Startup says the file system is damaged or corrupt, choose AutoRecovery from the Execute menu to perform a file-system check (by executing fsck) on the root file system. Or, you may run fsck manually by executing the following command:

fsck /dev/default

and in general, answer "y" to any questions that come up. If you want to automatically answer "y" to all questions, use the following command:

fsck -y /dev/default

After A/UX has examined and fixed the file system, type <cmd> <L> to relaunch A/UX.

Question: An application running in the Mac environment of A/UX has hung or seems to have crashed. What should I do?

Answer: If a server application running in the Mac environment of A/UX seems to have hung or crashed, DON'T push the reset button! First, quit and restart the Mac environment by entering the command:

<control> <cmd> <e> [NOTE: type all 3 keys simultaneously]

Please be patient - wait 10-30 seconds for A/UX to quit and restart the Macintosh environment.

Question: Who should I contact if I have a question or find a problem with the Workgroup Server 95.

Answer: The normal chain of technical support should be used to report any problems. This allows the engineering and support teams to process the reports in the most efficient manner and ensure that nothing slips through the cracks.

Question: I've tried to install the drivers for the CD-ROM, and the Finder hangs. What do I do?

Answer: The CD-ROM drivers are actually part of the Unix Kernel on the AWS 95, and so the Mac OS-based drivers are not needed, and are in fact not compatible with A/UX. They should not be installed.

Question: I installed an extension into my System Folder and now my machine won't let me log in. How do I get rid of it?

Answer: First, try holding down the Shift Key during logon to disable inits. If this doesn't work, you can change your logon type to a terminal to eliminate the Macintosh environment and use the Unix shell to delete the files. Please be aware that the Unix environment is case sensitive and that spaces need to be quoted, so you have to use strings like 'cd "System Folder"'. Installing an INIT manager such as Now Startup or Extension Manager is also an option.

ABS Tech Note: AWS11 Configuring UFS inode Overhead (8/93)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: AWS11 Configuring UFS inode Overhead (8/93)

==========

Article Created: 31 August 1993

TOPIC ----------

This technical note documents methods for tuning/creating a UNIX file system with lower overheads in terms of inode allocation, which proves to be important in large size file systems by reclaiming disk space on a Apple Workgroup Server (AWS) 95.

DISCUSSION ----------

The newfs command makes a Berkeley 4.2 UNIX file system (UFS) on the specified device file. The A/UX version of HD SC Setup invokes newfs when creating a UFS.

Each file on the system is represented by an inode, which contains critical information about the file, including ownership, permissions, size, and so on The newfs command allocates disk space for inodes when the UFS is created.

By default, newfs creates an inode for each 4 kilobytes (kb) of available space (2 kb on A/UX 3.0.1 and previous versions). Since each inode takes up 128 bytes on disk, the space dedicated for inodes (or the inode overhead) amounts approximately 3% of the total filesystem space (6% on A/UX 3.0.1 and previous versions). On a 1 gigabyte drive, this works out to be 32 megabytes (MB) or 250,000 inodes (64 MB or 500,000 inodes on A/UX 3.0.1 and previous versions).

If the average size of the files you use is much greater than 4 kb, for example, large, bit-mapped, color graphics, you may want to reclaim some of the inode overhead. Use the -i option to newfs to specify a larger value of bytes-per-inode (or the inode density). Figure 1 graphically depicts the inode overhead on differently-sized filesystems given inode densities of 2, 4 and 8 kb.

For example, if all the files you use contain at least 16 kb of data, you

would choose the bytes-per-inode to be 16384. You need to manually execute the newfs command from the A/UX CommandShell. Important: This must be done when the filesystem is created. If you already have data on this disk drive, be sure to back-up your data before re-creating the filesystem. Assuming the filesystem was previously formatted with HD SC Setup on an external SCSI drive (id 5) on the external main board SCSI bus (bus 2), you would enter the following command.

```
newfs -i 16384 /dev/dsk/c205d0s3 other
```

The filesystem device name is identified as /dev/dsk/cx 0yd0sz where x specifies the bus (1-4), y is the SCSI ID number (0-6), and z is the slice number.

Note: If the data on the filesystem will be predominantly Macintosh files in the AppleDouble format, for example, plain text files, be sure to allocate additional inodes. The AppleDouble format requires two inodes per file, one for the resource fork and one for the data fork.

AppleCD Multimedia Kit for Macintosh: Description (9/93)

Revised: 9/3/93
Security: Everyone

AppleCD Multimedia Kit for Macintosh: Description (9/93)

==========

Article Created:1 September 1993
Article Revised/Updated: 3 September 1993

TOPIC ----------

This article describes the AppleCD Multimedia Kit for Macintosh computers.

DISCUSSION ----------

The high-performance AppleCD Multimedia Kit for Macintosh computers offers all the components you need to advance your Macintosh into the CD-ROM and multimedia revolution. This multimedia kit gives you access to the wealth of business resources, educational programs, reference libraries, software, databases, clip art, and games available on CD-ROM. It comes complete with an AppleCD 300 external CD-ROM drive, AppleDesign Powered Speakers, all necessary cables and software, and up to five CD-ROM titles.

FEATURES

AppleCD 300 External CD-ROM Drive

- Double-speed (300 KB/sec), 295 ms access
- Lets you read multisession Kodak Photo CDs and play standard audio CDs
- Is compatible with industry-standard ISO 9660/High Sierra file formats and Macintosh HFS

AppleDesign Powered Speakers

- Personal, near-field listening
- High-quality stereo separation and sound
- Excellent frequency response using transducer, tuned-port design, and active equalization
- Built-in noise circuitry for clear sound
- Magnetically shielded

CD-ROM titles

- Apple Multimedia Starter CD
- Compton's Multimedia Encyclopedia
- An entitlement to 3 free CDs of your choice from the "Choose Your Three CDs" brochure.

Ordering Information

AppleCD Multimedia Kit for Macintosh
Order No. M2159LL/A

Related Products

Multimedia Kits: Overview of Three Bundles (9/93)

Revised: 10/12/93
Security: Everyone

Multimedia Kits: Overview of Three Bundles (9/93)

==========

Article Created: 1 September 1993
Article Reviewed/Updated: 12 October 1993

TOPIC ----------

At the time of introduction, three CD-ROM Multimedia bundles will be available for the USA and English-speaking geographies. The CD-ROM bundles are first in a series of bundled media products including "cross-platform" into the PC world. They include everything a customer needs to get started with the CD-ROM and media applications by creating an all-in-one solution. This article describes the three bundles.

DISCUSSION ----------

The first bundle is targeted at existing Macintosh customers.

Apple CD Multimedia Kit for Macintosh (M2159LL/A)

- AppleCD 300 drive and caddy
  SCSI system cable, and terminator
- AppleDesign Powered Speakers
  Powered speaker and satellite speaker
  Power-supply module (120-V input)
  Computer-to-speaker cable (with 3.5-mm miniplugs)
  CD stereo cable with RCA jacks
  Speaker-to-speaker cable
- Compton’s Multimedia Encyclopedia
- Apple Multimedia Starter CD
- CD-ROM titles brochure: an entitlement to 3 free CDs of the customer's choice
- Complete instructional documentation for setup and reference

* Macintosh System requirements *

- Any Macintosh running system software version 6.0.7 or later with a 68020 microprocessor or greater
- At least 5MB of RAM (or more) recommended

- A color display with 640 x 480 pixel resolution or greater

The second bundle is targeted at the PC-compatible and Windows customers. It's an "internal upgrade" meaning that the CD-ROM and Sound Card are mounted internally.

CD Multimedia Kit for PCs (M2160LL/A)

- AppleCD 300i (internal) drive and caddy
  Internal SCSI and audio cables, AT mounting rails
- AppleDesign Powered Speakers
  Powered speaker and satellite speaker
  Power-supply module (120-V input)
  Computer-to-speaker cable (with 3.5-mm miniplugs)
  Speaker-to-speaker cable
- Media Vision Pro AudioSpectrum 16 sound card
  QuickTime for Windows
  Spectrum 16 software
  Software includes Pocket Recorder, MIDI Sequencer, Software Controlled Mixer, TrakBlaster Pro, Monologue, and Windows drives
- Apple Multimedia Starter CD
  An entertaining introduction with movies, sounds, and pictures.
- Compton’s Multimedia Encyclopedia
- CD-ROM titles brochure: an entitlement to 3 free CDs of the customer's choice
- Complete instructional documentation for setup and reference

* System requirements *

- An 80386SX-based personal computer or greater running at 25 MHz or faster
- At least 4MB of RAM
- 10MB of available hard disk space
- VGA color display
- 5.25" half-height expansion bay
- ISA internal expansion slot
- Microsoft Windows version 3.0 or later and MS-DOS 5.0 or later

The third bundle is targeted at Macintosh Performa customers and is sold through channels that support the Performa line.

Performa Multimedia Upgrade Kit (M2364LL/A)

- AppleCD 300 drive and caddy
  Power cord, SCSI system cable, and terminator
- AppleDesign Powered Speakers
  Powered speaker and satellite speaker
  Power-supply module (120-V input)
  Computer-to-speaker cable (with 3.5-mm miniplugs)
  CD stereo cable with RCA jacks

Speaker-to-speaker cable
- Grolier's Encyclopedia
- Apple Multimedia Starter CD
- Complete instructional documentation for setup and reference

* Performa System requirements* *
- Any Macintosh Performa with a 68020 (with PMMU) microprocessor or greater running Performa system software
- At least 4MB of RAM (5MB or more recommended)
- A color display with 640 x 480 pixel resolution or greater

Article Change History:
12 October 1993 - Removed PMMU information under Macintosh System requirements
3 September 1993 - Revised PC system requirements, removed reference to Aris and MPC Wizard

CD Multimedia Kit for PCs: Description (9/93) (Discontinued)

==========

Article Created:1 September 1993
Article Reviewed/Updated: 3 September 1993

TOPIC ----------

This article describes the CD Multimedia Kit for PC-compatible computers.

DISCUSSION ----------

The high-performance CD Multimedia Kit for PCs offers all the components you need to advance your PC-compatible computer into the CD-ROM and multimedia revolution. This multimedia kit gives you access to the wealth of business resources, educational programs, reference libraries, software, databases, clip art, and games available on CD-ROM. It comes complete with an AppleCD 300i internal CD-ROM drive, AppleDesign Powered Speakers, Media Vision Pro AudioSpectrum 16 sound card, all necessary cables and software, and up to five multimedia CD titles. Kit contents exceed Multimedia PC Level 2 specifications.

The AppleCD 300i is a double-speed CD-ROM drive that offers the versatility to read multisession Kodak Photo CDs (with Kodak Photo CD access software) and to play standard audio CDs. You can cut and paste music, sound, animation, photographs, and even movies into your favorite word-processing, presentation, and graphics applications.

AppleDesign Powered Speakers equip your computer with CD-quality near-field stereo output, and excellent stereo separation and sound quality using controlled sound dispersion. Built-in noise circuitry provides clear sound, and each speaker is magnetically shielded for use near computer displays and peripheral devices.

The Media Vision Pro Audio-Spectrum 16 sound card gives you the highest-fidelity sound available on a PC. It includes 16-bit stereo sound and an advanced music synthesizer, and is compatible with Sound Blaster and other popular sound file formats.

..TIL13150-CD_Multimedia_Kit_for_PCs-Description_9-93_Discontinued.pdf

The Apple Multimedia Starter CD provides an interactive exploration of CD-ROM and multimedia including samples of education, business, and home uses for multimedia and “galleries” of clip art, photos, QuickTime movies, sound/music, and more. Each kit includes Compton’s Multimedia Encyclopedia, Apple Multimedia Starter CD, and your choice of additional free CD-ROM titles from a menu of over 30 titles carefully selected for value and quality.

FEATURES

Exceeds MPC Level 2 specifications

AppleCD 300i internal CD-ROM drive

- Double-speed (300 KB/sec), 295 ms access
- Lets you read multisession Kodak Photo CDs and play standard audio CDs
- Is compatible with industry-standard ISO 9660/High Sierra file formats and Macintosh HFS

AppleDesign Powered Speakers

- Personal, near-field listening
- High-quality stereo separation and sound
- Excellent frequency response using transducer, tuned-port design, and active equalization
- Built-in noise circuitry for clear sound
- Magnetically shielded

Media Vision Pro AudioSpectrum 16 sound card

- Highest-fidelity sound available on a PC
- 16-bit stereo sound with an advanced music synthesizer
- Compatible with popular sound file formats including Sound Blaster

CD-ROM titles

- Apple Multimedia Starter CD
- Compton’s Multimedia Encyclopedia
- Your choice of up to 3 free titles from a selection of 30 top CD titles

Performa Multimedia Upgrade Kit: Description (9/93)

Revised: 9/2/93
Security: Everyone

Performa Multimedia Upgrade Kit: Description (9/93)

==========

Article Created: 1 September 1993

TOPIC ----------

This article describes the Multimedia Upgrade Kit for Macintosh Performa computers.

DISCUSSION ----------

The Performa Multimedia Upgrade Kit includes everything you need to add to your existing Macintosh to enter into the exciting world of multimedia. It combines the speed and power of a Sony double-speed CD-ROM drive and the high quality sound from the AppleDesign Powered Speakers in one affordable package. The Performa Multimedia Upgrade Kit comes complete with two CDs, including the Grolier's Multimedia Encyclopedia and the San Diego Zoo Presents Animals (received through mail-back in return for registration.)

FEATURES

AppleCD 300 External CD-ROM Drive

- Double-speed (300 KB/sec), 295 ms access
- 256KB buffer for faster data transfer
- Automatic lens cleaning and double front-loading door for better dust protection

AppleDesign Powered Speakers

- Optimized output for personal listening
- High-quality stereo separation and sound
- Excellent frequency response using transducer, tuned-port design, and active equalization
- Built-in noise circuitry for clear sound
- Magnetically shielded

Computer Connectivitiy and Use

- Dual-input mixer for computer and CD-generated sound
- Magnetic shielding to prevent computer display image distortion
- Small, sleek design to fit on a desk

Ease of Use

- Built-in dual-channel amplifier
- Power, volume, and balance controls conveniently located on the front panel
- Head phone jack for privacy

CD-ROM Software included

- Apple Multimedia Starter CD
- Grolier's Encyclopedia
- San Diego Zoo presents animals (mail-back in return for registration)

CD Multimedia Kit for PCs: Technical Spec (Discontinued)

==========

Article Created: 1 September 1993
Article Revised/Updated: 13 September 1993

TOPIC ----------

This article gives the technical specifications for the CD Multimedia Kit for PCs.

DISCUSSION ----------

AppleCD 300i internal drive

Performance:
• Double-speed (300 KB/sec.) data-transfer rate
• 256KB buffer for faster data transfer
• Average access time of 295 ms

Compatibility:
• Compatible with ISO 9660 including High Sierra format and Macintosh HFS
• Supports multiple CD-ROM formats, including CD-ROM XA, multisession Photo CD, CD+G, and CD+MIDI
• Plays standard audio CDs
• CD digital audio data via SCSI

Reliability:
• Automatic lens cleaning and double front-loading door for better dust protection

AppleDesign Powered Speakers

Audio quality:
• Tuned-port bass-reflex system for extended low-frequency response
• Active equalization for best frequency response at all listening levels
• Focused sonic dispersion to optimize output for personal, near-field

listening
• Noise-reduction circuitry for audio clarity

Computer connectivity and use:
• Dual-input mixer for computer-and CD-generated sound
• Magnetic shielding to avoid image distortion on computer displays
• Small, sleek design to fit on a desk
• Compatible with virtually any personal computer, CD or audio cassette player, or television supporting sound output
• Built-in dual-channel amplifier
• Power, volume, and balance controls conveniently located on the front panel
• Headphone jack for privacy

Pro AudioSpectrum 16 sound card 16-bit sampling and playback

• 8-, 12-, and 16-bit PCM 2 kHz-44kHz in stereo
• Dynamic filtering 4 Hz-20 kHz programmable
• Yamaha YMF262 (OPL-3) 20-voice synthesizer

Volume control:
• Master volume: 0 to -62 dB (1 dB/step)
• Input mixer +1 to -60 dB (2 dB/step)

Signal audio output:
• 1 V p-p reference

Dynamic range and signal to noise:
• Synthesized and mixed audio: 90 dB
• Sampled audio PCM: 90 dB
• Total harmonic distortion: 0.05%

Frequency response:
• 30 Hz-20 kHz (+/- 3 dB)

System requirements:
• An 80386SX-based personal computer or greater running at 25 MHz or faster
• 4MB of RAM or greater
• 10MB of available hard disk space
• VGA color display
• 5.25" half-height expansion bay
• ISA internal expansion slot
• Microsoft Windows version 3.0 or later and MS-DOS 5.0 or later

CD Multimedia Kit for Macintosh: Specifications (Discontinued)

==========

Article Created: 2 September 1993
Article Reviewed/Updated: 19 August 1996

TOPIC ----------

This article gives the technical specifications for the Macintosh Multimedia Kit components.

DISCUSSION ----------

AppleCD 300 external drive

Performance:
- Double-speed (300 KB/sec) data transfer rate
- 256KB buffer for faster data transfer
- Average access time of 295 ms

Compatibility:
- Fully compatible with Macintosh operating system software, including System 7 and QuickTime software
- Compatible with ISO 9660 including High Sierra format and Macintosh HFS
- Supports multiple CD-ROM formats, including CD-ROM XA, multisession Photo CD, CD+G, and CD+MIDI
- Plays standard audio CDs
- Supports CD digital audio data via SCSI

CD 300 Size and weight:
- Height: 1.96 in. (5.0 cm)
- Width: 7 in. (17.75 cm)
- Depth: 13.1 in. (33.4 cm)
- Weight: 6.29 lb. (2.85 kg)

Formats supported:
- Multisession Kodak Photo CD
- ISO 9660/High Sierra
- Macintosh HFS

- CD-ROM XA
- CD+MIDI
- Standard Audio CDs

Interfaces:
- One headphone jack (front panel)
- Two SCSI 50-pin connectors for connection to the Macintosh and other SCSI devices (rear panel)
- Two RCA audio output jacks for external amplifier or amplified speakers (rear panel)

Capacity:
- Mode 1: 656 MB
- Mode 2: 748 MB

Audio Playback:
- Playing time: more than one hour
- Frequency response: 20 to 20,000 Hz

Electrical Requirements:
- Power requirements:
  External: 100 to 240 V AC, 50/60 Hz
  Internal: +5V DC ± 5% , 12 V DC ± 10%
- Power consumption:
  External: 0.28 A AC (drive on)
  Internal: 350 mA maximum for +5V and 750 mA average, 1.5 A peak for +12V

Environmental requirements:
- Operating temperature: 41° F to 104° F (10° C to 40° C)
- Storage temperature: -22° F to 122° F (-30° C to 65° C)
- Relative humidity: 5% to 90% noncondensing

AppleDesign Powered Speakers

Audio quality:
- Tuned-port bass-reflex system for extended low-frequency response
- Active equalization for best frequency response at all listening levels
- Focused sonic dispersion to optimize output for personal, near-field listening
- Noise-reduction circuitry for audio clarity

Computer connectivity and use:
- Dual-input mixer for computer- and CD-generated sound
- Magnetic shielding to avoid image distortion on computer displays
- Small, sleek design to fit on a desk
- Compatible with virtually any personal computer or electronic device with stereo audio line out player, or any television supporting sound output
- Built-in dual-channel amplifier
- Power, volume, and balance controls conveniently located on the front panel

• Headphone jack to provide privacy

Speaker type:
• Full range, tuned port, bass reflex

Maximum output:
• 90-dB sound pressure level (SPL) at 0.5m at 90 Hz

Maximum input voltage:
• 2 V peak-to-peak

Interfaces:
• One stereo computer-sound input port
• One stereo CD/audio input port
• One stereo headphone output port

Controls:
• Power on/off
• Balance
• Volume

Power Source:
• 15-V DC power supply

Electrical requirements:
• Line voltage: 100 to 240 depending on the power-supply module
• Frequency: 50 to 60 Hz
• Power: 40 watts maximum

Environmental requirements:
• Operating temperature: 50° F to 104° F (10° C to 40° C)
• Storage temperature: -40° F to 116.6° F (-40° C to 47° C)
• Relative humidity: 20% to 85% noncondensing
• Maximum altitude: 15,000ft. (4722 m)

Speaker Size and Weight:
• Height: 9.25 in. (23.1 cm)
• Width: 4.5 in. (11.2 cm)
• Depth: 4.75 in. (11.9 cm)
• Weight: 4.8 lb. (2.2 kg)

ABS Tech Note: DAL27 REXEC Time-outs For TCP (8/93)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL27 REXEC Time-outs For TCP (8/93)

==========

Article Created: 31 August 1993

TOPIC

This Technical Note discusses session establishment timing between a DAL Client and Server using the REXEC facility of TCP/IP.

DISCUSSION

REXEC daemons: function in the DAL environment

REXEC is a standard daemon used in TCP/IP environments. Its primary function is to listen for incoming requests from remote hosts and respond appropriately. Specifically for Data Access Language, REXEC is used by the various DAL Servers to establish sessions with DAL Clients. In the A/UX, VAX/VMS, and VM/CMS host environments, REXEC will respond by logging in the USERID of the client on behalf of the client. For AS/400 and MVS, a sub task is spawned as part of a main server task.

Port numbers

Each DAL Server is configured to listen for connections on a specific REXEC port number. By default, DAL uses the de-facto standard of 512. Once the server is started, it waits to receive a connection request on the specified port number. Upon receiving a request, a validation is made against the user (client) making the request using the host's security facilities. If validated, a connection is then initiated back to the client on a different port number and the session begins. The port number that the server uses to respond back to the client varies from session to session; the REXEC daemon listener port is constant (unless changed in the DAL Server's configuration and a restart of the server is performed).

Timing issues

Since there can only be one client using the services of REXEC at any given time, a request to REXEC while it is in use will result in an error. The

exact codes returned to the client will vary depending upon the server and client versions and platforms. The amount of time REXEC will be busy (and thus unavailable for any other client requests) will also vary based upon server platform due to size, implementation, load factors, and so on.

In all cases, REXEC is busy starting from the time it receives a connection request until (1) The request is satisfied via establishment of a session over a different port number or, (2) The request is rejected due to authorization failure. Once the session has been established or rejected, REXEC is then free to receive a new connection request.

ABS Tech Note: DAL28 HOME Key (8/93)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL28 HOME Key (8/93)

==========

Article Created: 31 August 1993

TOPIC ----------

This Technical Note describes the need when making connections with DAL Clients to DAL Servers in the IBM environment, to send a HOME key as part of the login or logoff sequence.

DISCUSSION ----------

When making connections with DAL Clients to DAL Servers in the IBM environment using 3270 (MVS/TSO, MVS/VTAM, VM/CMS) or 5250 (AS/400) datastream protocols, it may be necessary to send a HOME key as part of the login or logoff sequence. HOME is not currently implemented within DAL's connection scripts. These scripts are commonly known as 'DAL Preferences' (Macintosh System 7.x), 'hosts.cl1' (Macintosh System 6.0.x), and 'hosts.dal' (DOS/Windows clients).

It is still possible to access the field desired by using a combination of forward tab (FTAB) or backward tab (BTAB) characters. Experimentation should be done with a 'live' 3270 or 5250 session to determine the exact number of tabs required.

Tech Info Library Article Number:13158

ABS Tech Note: DAL29 UPDATE Statements and $sqlcode (8/93)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL29 UPDATE Statements and $sqlcode (8/93)

==========

Article Created: 31 August 1993

TOPIC ----------

When a DAL UPDATE statement is executed and does not modify any rows, $sqlcode returns 0, even though some kind of error response would be appropriate.

DISCUSSION ----------

The problem is that DAL is using dynamic SQL statements, and DBMS vendors do not return an appropriate SQLCODE to DAL under this circumstance, so there is no way for DAL to return an error.

If this information is necessary, you can check for a non-zero set of data by doing a SELECT FOR EXTRACT and checking $rowcnt to make sure it is greater than zero.

For instance, the following SQL will update no rows in the demonstration tables, but return an $sqlcode of 0:

```
UPDATE offices SET city = 'Port Ludlow' WHERE office_nr = 444;
print $sqlcode;
```

To verify whether or not this command modifies rows, the following code can be used:

```
SELECT city FROM offices WHERE office_nr = 444 FOR EXTRACT;
print $rowcnt;
```

If $rowcnt is greater than zero, then the equivalent UPDATE statement will modify rows.

This limitation may be resolved in a future release of DAL if the appropriate information is available from the host DBMS.

Tech Info Library Article Number:13159

ABS Tech Note: DAL30 Error Inserting Date With Select (8/93)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL30 Error Inserting Date With Select (8/93)

==========

Article Created: 31 August 1993

TOPIC ----------

This tech note describes a problem with DAL and the Oracle DBMS relating to inserting dates.

DISCUSSION ----------

If you try to insert into a table using values from another table with an INSERT INTO <table> SELECT phrase, and if there's a date involved the insert will fail with an Oracle error. You can insert the same date value if you use an INSERT INTO <table> VALUES phrase. The following code shows an example:

```
set $datefmt="DDMMM YY";
set $timefmt="HHMM";
insert into table_name values ("234234", "@#$@", "12Feb 92 0901");
insert into location values ("AAAAAA", "BBBB");

insert into table_name select location.station, "BBBB", "12Feb 92 0901"
from location where location.building = "BBBB";
```

••••Remote DAL Error••••
•Primary Error: untranslated DBMS error (-10207)
•Secondary Error: (-1830)

This is not a DAL error, but an Oracle error, and the same error can be reproduced under SQL*Plus. You can work around this error by removing the time field and only inserting the date.

Tech Info Library

ABS Tech Note: DAL31 DAM And Non-Text Data (8/93)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL31 DAM And Non-Text Data (8/93)

==========

Article Created: 31 August 1993

TOPIC --------------------

This Technical Note is about Data Access Manager and non-data returns.

DISCUSSION --------------------

When using either the high-level or low-level interfaces of the Data Access Manager, by default the text is coerced to return as text strings. There are routines that allow a programmer to install and remove their own result handlers to override this (DBInstallResultHandler, DBRemoveResultHandler, see IM VI 8-65), but if the underlying database adaptor is Data Access Language, it must also be coerced to return non-text data as well. If you don't take that step then DAL will return data to DAM as text and your own result handlers will not be called.

ABS Tech Note: DAL32 Terminal Servers and DAL (8/93)

Revised: 9/2/93
Security: Everyone

ABS Tech Note: DAL32 Terminal Servers and DAL (8/93)

==========

Article Created: 31 August 1993

TOPIC ----------

This technical note discusses a problem with reliability problems when trying to connect to a DAL server through an asynchronous connection and a terminal server.

DISCUSSION ----------

When attempting to connect to a DAL server via the Asynchronous network adapter through a terminal server, you may have trouble writing connection scripts that work reliably. A common symptom is that the connection scripts work when in debugging mode, but they don't work as consistently (or at all) when in standard mode.

Some terminal servers do baud rate recognition and require two carriage returns at the beginning of the script to activate them. DAL may send those returns with too little delay for the server to recognize them. The solution is to add a short wait between the two returns by modifying the script from '\r\r' to '\r\w1\r', which forces DAL to pause long enough for the terminal server.

System 7.1.x: Foreign Language Keyboard & KCHR Resource (1/95)

Revised: 1/17/95
Security: Everyone

System 7.1.x: Foreign Language Keyboard & KCHR Resource (1/95)

==========

Article Created: 1 September 1993
Article Reviewed/Updated: 17 January 1995

TOPIC ----------

How can I obtain and install the keyboard layout for French, Spanish, Italian, German, and so on in System 7.1.x?

DISCUSSION ----------

With the release of System 7.5 there is built in support for many European languages. For more informaiton search the Tech Info Library for the article titled, "Keyboard Control Panel: International Layouts (10/94)".

You can add keyboard layouts from other countries to your system by dragging keyboard resources known as a KCHRs into your System Folder.

You can extract the KCHR from the internationalized version of system software of the country you want. Using German as an example, find the German 7.1 Images on the System Software CD (part of the Developer CD series). Double click on the Deutsch 7.1.sea and download the software to your hard drive. Double click on the System suitcase, and you'll see the KCHR for German.

Once you've extracted this resource, follow these steps:

1) Drop the German KCHR file into your U.S. System File within the System Folder.
2) Choose the Keyboard Control Panel in the Apple Menu. You'll see that for Keyboard Layout, German KCHR is now one of the choices. If you highlight German KCHR, your keyboard now becomes German.
3) You can check that you're in German mode by choosing Key Caps from the Apple menu. You'll find, for example, that the "y" key now becomes the "z" key and vice versa.

For your reference, system resources of type KCHR map key codes to

character codes. Each resource of type KCHR normally corresponds to a natural language, and represents the character set in which the language is written.

Another good source of information is the book called "Guide to Software Localization" which you can order through APDA.

Article Created: 1 September 1993
Article Reviewed/Updated: 30 March 1994

TOPIC ----------

What is MacTest Pro?

DISCUSSION ----------

MacTest Pro is diagnostic software that can test logic boards, video cards, monitors, floppy drives, hard drives, and CD ROM drives. It can also detect software corruption problems, and the existence of multiple System Folders on a volume.

Refer to the Service price pages for information on ordering MacTest Pro.

For information on which computers are tested by each version of MacTest Pro, check the Tech Info Library using "MacTest" as the search word.

Article Created: 1 September 1993

TOPIC -----

This article lists the major changes made to NSI 1.3.2.

DISCUSSION -----

Network Software Installer 1.3.2:

- Installs AppleTalk v58.0.2 onto PowerBook Duos. NSI 1.3 was incompatible.
- Recognizes the Centris and Quadra 800 units and installs the latest EtherTalk software. NSI 1.3 didn't install the correct EtherTalk software to the Centris and Quadra 800.
- Installs A/ROSE v1.2 which is compatible with the Macintosh IIvx, and allows use of the Ethernet NB card on the IIvx system.
- Fixes the compatibility issue between EtherTalk and DecNet tools which was broken with NSI 1.3.
- Improves the performance of built-in Ethernet for all 68040-based systems. Anyone using a Quadra should install NSI 1.3.2 for this reason.

Newton MessagePad: NiCds in Alkaline Battery Holder (8/93)

Revised: 9/2/93
Security: Everyone

Newton MessagePad: NiCds in Alkaline Battery Holder (8/93)

==========

Article Created: 2 September 1993

TOPIC -----

Can I use Nickel-Cadmium (NiCd) AAA batteries in the Newton MessagePad's alkaline battery holder in place of AAA alkaline batteries?

DISCUSSION -----

You may be able to operate your Newton MessagePad with Nickel-Cadmium (NiCd) batteries in the alkaline battery holder. Apple, however, does not support their use and recommends that you use NiCd battery packs designed specifically for the Newton MessagePad.

If you do put NiCd batteries in the MessagePad's alkaline battery holder, each battery must have .22 Amp-hour (Ah) capacity. If you use batteries with a different capacity, the MessagePad may fail to operate and/or may suffer damage.

Alkaline and NiCd batteries function differently in the MessagePad. If you put an alkaline battery holder filled with NiCd batteries into your MessagePad, the MessagePad will treat the batteries as if they were alkaline instead of NiCd. This may cause the MessagePad to shutdown more quickly.

Note that the Newton MessagePad will not recharge any batteries that are in the alkaline battery holder. Also, do not insert the alkaline battery holder (with any type of batteries) into the Newton Battery Charger. This may damage both the batteries and the charger.

PowerBook Duo Dock and Ethernet Problem (9/93)

Revised: 7/8/94
Security: Everyone

PowerBook Duo Dock and Ethernet Problem (9/93)

==========

Article Created: 2 September 1993

TOPIC -----

I'm having a network problem. The network is a star network controlled by Farallon's StarLet. The network contains a Macintosh Quadra 800, a Macintosh Quadra 950, and three PowerBook Duo 230 computers with Duo Dock, each has Apple Ethernet cards.

The network works properly over LocalTalk, but after selecting Ethernet the StarLet control LEDs indicating collisions related to the Duo Docks. All of the Ethernet cards are from Apple. The cards in the Duo Docks were tested in a Quadra and seem to work properly. Below are the software configurations being used:

1) Network CDEV ver. 2.3.3
   EtherTalk Phase 2 ver. 2.3.1
   AppleTalk ver. 57.0.4

2) Network CDEV ver. 2.3.3
   EtherTalk Phase 2 ver. 2.3.1
   AppleTalk ver. 58.0

3) Network CDEV ver. 2.3.3
   EtherTalk Phase ver. 2 2.3.1
   AppleTalk ver. 56

4) Network CDEV ver. 2.3.3
   EtherTalk Phase 2 ver. 2.5
   AppleTalk ver. 57.0.4

5) Network CDEV ver. 2.3.3
   EtherTalk Phase ver. 2 2.5
   AppleTalk ver. 58.0

6) Network CDEV ver. 2.3.3

EtherTalk Phase 2 ver. 2.5
AppleTalk ver. 56

DISCUSSION ----------

The problem is most likely caused by the presence of AutoRemounter 1.0 in the Control Panels folder of the PowerBook Duo computers. If this software is removed, does the problem persist? (The software needs to be removed, turning it off does not help.) If this resolves the problem, please ask the customer to not re-install the software. An updated version of AutoRemounter that corrects this problem should be available around mid September 1993.

ARA and CCL With NOTE Command On Hang Up (9/93)

Revised: 9/3/93
Security: Everyone

ARA and CCL With NOTE Command On Hang Up (9/93)

==========

Article Created: 2 September 1993

TOPIC ----------

I have modified a CCL to work with the Defender security system. Everything works fine until I click the disconnect button. At this point the Macintosh hangs with "Sorry a system error ... ARA error Type 11". The entire operating system hangs and the Macintosh must be rebooted.

Now the Macintosh works fine with all other CCL's, and dials up and handles all Defender Prompts.

1) The customer has a large CCL. The number of branches is not over 128 but it is large. Could the size of the CCL cause memory errors?

2) Do we know of errors with the disconnect routine?

DISCUSSION ----------

We think that when you wrote your CCL you used a NOTE command in the hang up section of the CCL. The NOTE command is not supported in the hang up section of the CCL. This is a known problem and has been reported, although we can't say for sure whether or not it will be fixed in the next release of ARA.

Express Modem: Latin America Compatible (9/93)

==========

Article Created: 3 September 1993

TOPIC ----------

I read the back of an Express Modem Specifications sheet and it states that it's compatible with MOST South American countries. Why isn't it compatible with all South American countries?

DISCUSSION ----------

The Express Modem is compatible throughout Latin America. Fortunately, the telephone systems in Latin America are compatible with each other. The other bit of good news is that if a product receives FCC approval it is automatically approved in the Latin American countries.

Hebrew Font: Characters Appear as Squares (9/93)

Revised: 9/3/93
Security: Everyone

Hebrew Font: Characters Appear as Squares (9/93)

==========

Article Created: 1 September 1993

TOPIC ----------

When booting from the Hebrew Installation disk #1, the Hebrew font isn't properly loaded and all of the characters appear as squares.

DISCUSSION ----------

This is a known problem, however the workaround is very easy. It requires that you lock the installation disk before booting the system. If the disk isn't locked, the fonts aren't loaded properly and the font defaults to Geneva. The Hebrew characters map to the square character in Geneva.

The disk is also corrupted. If you created your disks from the Developer CD, just recreate the disk and be sure to lock it before booting from it.

PhotoGrade: Requirements for Increased Resolution (9/93)

Revised: 9/3/93
Security: Everyone

PhotoGrade: Requirements for Increased Resolution (9/93)

==========

Article Created: 1 September 1993

TOPIC ----------

I thought the LaserWriter IIf and IIg printed images using PhotoGrade at a much higher resolution. I'm not seeing a difference.

DISCUSSION ----------

PhotoGrade is available on the LaserWriter IIf and IIg, but must be enabled by setting the Color/Grayscale radio button in the "Print" dialog.

Also, PhotoGrade requires quite a bit of memory to print large, high quality images. Increase the RAM in the IIf and IIg.

Use the LaserWriter Utility that ships on a disk with the IIf and IIg to adjust the PhotoGrade settings for more levels of gray, or higher resolution.

Finally, some applications don't automatically use Photograde, and must be set to do so. When possible, set the default to "Use printer's settings," to allow the IIg to set the line screen and use Photograde. If the line screen must be set manually, set it to 106 lpi (the default for the IIg).

Windows 3.x: Accessing Apple LaserWriters (4/96)

Revised: 4/22/96
Security: Everyone

Windows 3.x: Accessing Apple LaserWriters (4/96)

==========

Article Created: 1 September 1993
Article Reviewed/Updated: 22 April 1996

TOPIC ----------

How do I access Apple LaserWriters from a PC running Windows 3.x?

DISCUSSION ----------

Windows ships with a basic PostScript driver upon which sit individual vendors' Windows Printer Description (WPD) files to support custom features of specific printers. Users wishing to access Apple printers via Windows should acquire the latest driver from Microsoft.

The WPD for the LaserWriter IINTX will support basic printing services for the IINT, IINTX, IIf, and IIg. There are problems with the NTR, but it may work in some situations. There's no support under the IINTX WPD for custom features on the IIf and IIg, like FinePrint and PhotoGrade. The LaserWriter IINTX WPD is available from Microsoft through a variety of sources, including their CompuServe forum.

Beginning with the LaserWriter Pro and Select series, Apple offers more support for Windows users. Unlike LaserWriters in the II series, the Pro and Select ship with a floppy disk specifically for Windows 3.x users. It contains new WPD files for the Pro and Select series, and a crude LaserWriter Utility which will allow power users to gain control of custom features such as FinePrint, PhotoGrade, 600dpi, and so on.

All of this comes with a strict caveat from Apple: do not use non-standard or non-commercial Windows applications when using Apple LaserWriters.

Control Panel: Fixing Abnormal Icons (11/94)

==========

Article Created: 1 September 1993
Article Reviewed/Updated: 11 November 1994

TOPIC ----------

My Control Panel icons look strange, where they used to have some design to them, they now appear generic.

DISCUSSION ----------

You should be able to recover the icons by rebuilding the desktop by holding down the Command and Option keys at startup. You will see a dialog box asking if you want to rebuild the desktop, select yes and it will preform the operation and continue the boot process.

If this doesn't fix the problem, delete the invisible Desktop DB and Desktop DF files from the hard drive. The easiest way to do this is to use a disk utility program to make these files visible, then drag them to the trash.

System File: What Increases Size Under System 6 and 7 (9/93)

Revised: 9/3/93
Security: Everyone

System File: What Increases Size Under System 6 and 7 (9/93)

==========

Article Created: 1 September 1993

TOPIC ----------

When I choose "About this Macintosh..." from the Finder, it says the System is 4 megabytes or larger. Why is the System so big?

DISCUSSION ----------

The System can get big, but unless you have a large number of fonts it should never be larger than 3MB under System 7, and much less than that under System 6. There are several reasons the system will appear to grow. Here are the most common ones.

System 6

System 6 acts differently from System 7 in that its RAM heap is a fixed resource which needs to be constantly managed if you have many INITs and/or fonts installed. HeapFixer from CE Software is a simple utility which allows setting the System 6 heap size. The basic rule under System 6 was to keep the System showing 25% free (that is, white) space in the "About this Macintosh..." dialog.

These are the contributors to System File size under System 6:

- Fonts and INITs - both contribute to System memory requirements.
- Bit mode - System 6 is a 24-bit operating system. This means that unless a System 6 Macintosh has a third-party INIT enabling 32-bit addressing (such as Maxima from Connectix), all installed physical RAM over 8MB will show up as additional System memory.

System 7

Under System 7, the operating system maintains more extensive guards against running out of memory. Basically, the Cache (configured in the Memory Control Panel) controls how much space to allocate to the

System. Memory management was improved under System 7, and users no longer need to worry about the "25% free space" concept. The System will typically take up 95-99% of its allocation, leaving only a small bit of white space in the "About this Macintosh..." graphic. This is nothing to worry about. If you get messages that you need more memory, then you can allocate more in the form of Cache, or you should consider adding more RAM if there's none available for additional Cache.

Here are the factors that contribute to a large System File size under System 7:

- Fonts - Previous to version 7.1, each installed font drove the system's RAM requirements up.
- Cache - The amount of RAM Cache allocated in the Memory control panel is included in the overall figure for System RAM requirements. To correct: set the Cache to 256K or less, and restart.
- Extensions - Each extension obtains its own amount of RAM and contributes to a large System RAM requirement.
- Bit mode - if the Macintosh has more than 8MB of physical RAM installed and is set to run in 24-bit mode (under the Memory Control Panel), then the excess over 8MB shows up as System memory. To correct: set the Macintosh to run in 32-bit mode.
- RAM Disk - Macintosh computers supporting the Apple RAM Disk (Quadras and later) can create a RAM disk using a portion of their installed physical RAM. All RAM used in the RAM Disk shows up as System memory in the "About this Macintosh.." dialog.

Hayes SmartCom Fax Print 1.0: Incompatible with AV Macs (9/93)

Revised: 9/8/93
Security: Everyone

Hayes SmartCom Fax Print 1.0: Incompatible with AV Macs (9/93)

==========

Article Created: 7 September 1993

TOPIC ----------

This article describes an incompatibility between:
• Hayes SmartCom Fax Print 1.0 software, and
• the Macintosh Centris 660AV and Quadra 840AV.

DISCUSSION ----------

According to Hayes technical support, SmartCom Fax Print 1.0 software is incompatible with AV Macintosh models. A revision is planned, but a release data is not known as of 7 September 1993.

Customers have experienced severe system crashes on AV Macintosh models when using the SmartCom Fax software. Reinitializing the hard disk is necessary, because Disk First Aid can't repair the damage.

WorldScript: Requires a Script Bundle Like Japanese Lang. Kit

Revised: 9/7/93
Security: Everyone

WorldScript: Requires a Script Bundle Like Japanese Lang. Kit

==========

Article Created: 7 September 1993

TOPIC -----

My understanding of Worldscript is that with system software 7.1 you can use localized Japanese versions of the software without having to run the localized version of the operating system, and use WorldScript-aware applications with the Japanese fonts.

I also need a list of current localized Japanese and Worldscript-aware Applications.

DISCUSSION -----

Yes, you can use localized Japanese versions of software without a localized operating system, but only if you have the Japanese Language Kit installed. It provides the ability to input Japanese text into localized or WorldScript-aware applications.

The Japanese Language Kit is basically installed on top off an already existing System 7.1 system. If the existing system is the U.S. version of System 7.1, then the primary script (what language the system boots from and displays -- for instance, the menu bar) is English. But you can now launch Japanese versions of applications and input Japanese characters just as if they were running on a localized system.

You can also use WorldScript-aware applications with the Japanese fonts, if they have the Japanese Language Kit installed.

You can find a list of current localized Japanese and Worldscript-aware software in the Tech Info Library under "Japanese Language Kit: Overview". The article includes the compatibility list.

At Ease 2.0: Setting Up For Users (8/95)

Revised: 8/14/95
Security: Everyone

At Ease 2.0: Setting Up For Users (8/95)

==========

Article Created: 7 September 1993
Article Reviewed/Updated: 14 August 1995

TOPIC ----------

This article describes how to configure At Ease 2.0 for users, including how to turn it on, how to set an administrator password, and how to register users.

DISCUSSION ----------

The At Ease Administrator sets up the At Ease 2.0 system for users and establishes the access privileges each will have. The administrator should follow these directions to get At Ease 2.0 ready for use (it is important to follow the steps in order):

TURNING ON AT EASE 2.0

When you first turn on your computer, At Ease is turned off. (This is true even if your copy of At Ease was factory-installed.) To turn it on:

Step 1

Double-click the hard drive icon on the upper-right side of the screen.

Step 2

Double-click the At Ease Setup icon.

Step 3

Click the On button in the At Ease Setup window.

SETTING AN ADMINISTRATOR PASSWORD

The administrator should set his or her own password so that no one else can access the At Ease Setup program to change access privileges.

Step 1

Choose Administrator Password from the Options menu.

Step 2

Type the password of your choice in the top box. The password can be up to 15 characters. Dots will appear in place of the letters you type to keep the password confidential from people who might be within reading distance of your screen.

Step 3

Retype the password in the second box to confirm it.

Step 4

Type a clue in the large text box. This is optional, but may help you remember your password in the future. It will always be shown when you are asked for the administrator password. Your clue may be up to 63 characters.

Step 5

Click OK.

REGISTERING USERS

Each person who will use the Macintosh should be registered in the At Ease Setup program. You can register up to ten users, each with different access privileges.

Adding a User

Step 1

Click the New button in the At Ease Setup window. The New User window will appear.

Step 2

Type the user's name in the uppermost box.

Adding A Password

Type a password in the second box (optional). Be sure to inform the user of his or her password. All users can change their passwords later if they want to.

Choosing At Ease or the Finder

Step 1

Determine the user's needs and choose whether the user will use At Ease or the Finder. If you choose "Stay in At Ease," skip to step 6.

Step 2

If you chose "Switch to Finder," that user will not be able to use At Ease. Click Done and you will be returned to the At Ease setup screen.

Step 3

Click the Next button to continue registering the user.

Establishing Access Privileges to Programs and Documents

Step 1

Click the Add Applications button. At Ease will search for all application programs on your hard drive on the left, and all of the applications listed for access by this user on the right. (If this is the first time you have set access privileges for this user, the right window will be empty.)

Step 2

In the Add Applications window, select any programs you want this user to have access to. Click Add.

Step 3

When you are done, click OK.

Step 4

To give the user access to other items, such as documents, click the Find Items button.

Step 5

Type all or part of the item's name.

Step 6

Click Finder. The item will show up in the right window.

Step 7

Click Add to add the item to the users list of accessible items.

Step 8

Click OK, then Click Next.

Customizing At Ease Menus

Step 1

If you want the user to see limited, basic menus, leave the Minimal button selected. Minimal limits the commands available to things like Open, Close, Quit and Restart.

Note: Minimal users will not be able to see the Chooser in the Apple menu.

Step 2

If you want the user to have access to all At Ease commands, click the All button. This allows users to perform such tasks as renaming and deleting files, copying files to and from floppy disks and changing Views.

Activating Text-To-Speech

You can have At Ease speak the names of buttons when the pointer passes over them. This is a handy feature for non-readers or people with vision difficulties.

Step 1

To activate text-to-speech, click the "Speak button names" button under Speech.

Step 2

Click Next.

Assigning a Location for Opening and Saving

• Anywhere -- The user can use his or her discretion and save files anywhere on the computer. This limits the administrator's ability to control file management and limits other users' privacy.

• Only in user's folder -- Keeps all the user's documents in one place and limits disk clutter elsewhere.

• Only on floppy -- A good idea if many people are saving many items and could quickly fill up disk space. This gives the administrator complete control over the arrangement and content of the hard disk. However, users will miss the convenience of keeping items stored in one place.

Access to the Finder

Some users who are more familiar with the Macintosh might want access to the Finder. Such access can be made available through At Ease.

Step 1

Click "Allow access to Finder." This is different from choosing the Finder as a startup environment. In this case, the user will start in At Ease but be free to switch to the Finder when he or she wants.

Note: The administrator should always check this if he or she chose At Ease as a startup environment while registering himself or herself.

Step 2

Click Done.

Step 3

Select Quit from the File menu when you finish registering users.

Removing Users

If you decide to remove users from At Ease, follow these steps:

Step 1

Open At Ease Setup. You will be asked for your administrator password.

Step 2

Select the name of the user you want to remove.

Step 3

Click Remove.

Changing Access Privileges

If you decide to adjust the privileges of any of the At Ease users:

Step 1

Open At Ease Setup.

Step 2

Click the name of the user whose privileges you want to change.

Step 3

Click Open.

Step 4

Click Add Applications.

Step 5

Click the Applications you want to remove or add.

Step 6

Click Add or Remove.

Step 7

Click Find Items if you want to change privileges on certain documents.

Step 8

Click the items you want to add or remove.

Step 9

Click Add or Remove.

Step 10

Click OK.

At Ease 2.0: Basic Use Tips (8/95)

Revised: 8/14/95
Security: Everyone

At Ease 2.0: Basic Use Tips (8/95)

==========

Article Created: 7 September 1993
Article Reviewed/Updated: 14 August 1995

TOPIC ----------

This article discusses the basic day-to-day use of At Ease 2.0, including switching between panels, paging through, opening programs and documents, saving, and changing your password.

DISCUSSION ----------

After you have installed and configured At Ease 2.0 for users, you are ready to begin using it. When you start up in the At Ease environment, you will see the At Ease desktop, which looks like two manila folders (called panels), one on top of the other. One of the panels is titled At Ease Items, and the other is titled User Items (or the name of the user who had logged on).

Each of the panels has buttons on it representing applications or documents. The menu commands you can see will vary depending on what access privileges you were assigned by the administrator.

Switching Between Panels

To switch between the At Ease Items panel and your panel, just use the mouse to click the tab where the name of that panel appears.

Paging Through

If you can't see the item you want on the panel where you expect it to be, it is probably on a different page. At Ease supplies extra pages for buttons when you fill the first page and need more space.

The number of the page you are on, as well as how many total pages compose the panel you are looking at, appears at the bottom of the panel. You will also see upturned page corners on one or both of the bottom corners of the panel, indicating there are additional panels to be seen.

To move between pages:

1) Click the left corner to go to the previous page, or click the right corner to go to the next page.

2) To go to a specific page, hold down the Command (Apple) key and type the number of the page you want.

Opening Programs and Documents

To open either a program or a document, use the mouse to move the pointer to the button you want and click once. The desktop will disappear and you will see the window of the application or document you chose.

Saving Documents

When you save a new document, your choice of where to save it is determined by how the administrator set up your user registration. There are three possibilities, and you may need to check with your administrator to be certain which applies to you.

The three settings are:

• Anywhere -- Allows you to save documents anywhere on the hard disk or on a floppy. When you choose Save or Save As, you are presented with a dialog box that lets you select the location you wish.

• Only in user's folder -- Allows you to save documents only in your own folder. When you choose Save or Save As, the dialog box presented lets you save directly to your folder. You can also create new folders within your folder.

• Only on floppy disk -- Prevents you from saving documents to anything but a floppy disk. When you choose Save or Save As, you are prompted to insert a floppy disk unless one is already in the drive.

Changing Your Password

You may want to change the password the administrator gave you when you were registered. Here's how:

1) Start the Macintosh.

2) Click the Change button in the Password window that appears.

3) Type your old password in the upper box, then type your new password in the box below it. Type it again in the third box to confirm it. (Dots will appear in place of letters as you type, so people nearby can't see your password.)

4) Click OK.

AWS 95: Volume and Finder File Limit (10/93)

Revised: 11/16/93
Security: Everyone

AWS 95: Volume and Finder File Limit (10/93)

==========

Article Created: 24 August 1993
Article Reviewed/Updated: 26 October 1993

TOPIC ----------

I have an Apple Workgroup Server (AWS) 95. I want to know if I can use a hard disk larger than 2GB, and if the 32,000 file limit for the Finder in Macintosh OS applies to the Finder environment under A/UX? If I have four separate UFS partitions on a drive, and mount them all into folders in the Shared Data folder, can each one have 32,000 files, and still be viewable from the Finder environment?

DISCUSSION ----------

System Volume Limit

Since the AWS 95 uses A/UX it also has a 2GB file system limit, however, you could have several UNIX file systems mounted to get around some of the limitations of the Finder's 2GB limit. The Finder based AppleShare clients can not. What this means is that in order to use larger volumes on the AWS 95 you must share partitions of less than 2GB as separate AppleShare Volumes. Following is an example to help explain:

You could have A/UX and AppleShare Pro running on a 400 MB partition and mount a couple of partitions of about 2GB in size. Although the total size of disk space available is more than 2GB, A/UX deals with each UNIX mounted disk as a separate volume, therefore not running into the 2GB limitation. Do not share the parent directory of the mount points, share each one of the mount points separately.

Finder File Limit

For clarification, the maximum number of files and folders on a Macintosh HFS volume is 65,535 while the maximum number of files in a folder is 32,768. Remember these numbers are maximums under specific conditions, not for a practical implementation.

For the server client, the HFS limits for number of files to a folder still apply when sharing a UNIX volume, no more than 32,768 files should be present in a single directory (folder). We recommend 500 or less as the practical maximum.

On an AWS 95 with the Finder running in the Macintosh process under A/UX, the same limits for number of files to a folder still apply as the native Macintosh Finder. No directory may contain more than 32,768 files, however once again we recommend 500 files or less as the practical maximum.

Security: Everyone

At Ease 2.0: Menus, Commands and Shortcuts (8/95)

==========

Article Created: 7 September 1993
Article Reviewed/Updated: 14 August 1995

TOPIC ----------

This article discusses:
• the location and function of At Ease menus and commands
• keyboard equivalents for menu commands.

DISCUSSION ----------

INTRODUCTION

The menus are located in a bar across the top of the screen.

Depending on what menus were selected for you when you were registered to use At Ease, you will either have minimal menus or full menus.

• Minimal menus contain the only commands that are always available in almost any situation, like Close, Quit, and Restart. They do not include the ones marked "optional" in the following list.

• Full menus include all of the commands discussed here.

The keyboard equivalents allow you to execute the commands without pulling down menus. They require that you hold down the indicated keys simultaneously.

(In this article, the key used to activate keyboard equivalents is called the Apple key because the keycap is labeled with the Apple logo. It is sometimes referred to as the Command key.)

THE FILE MENU

If you have access to full menus, you will see a menu with ten items in it. If you have access to minimal menus, you will see a menu with two items, Close and Quit.

New Folder (optional)

• Keyboard Shortcut: Apple-key, N

This command allows you to create new folders on your user panel. After a new folder is created, you can save new documents to it, but you can't move any documents that were previously created into the new folder.

To create a new folder:

1) If necessary, click the tab of your user panel to bring it to the foreground.

2) Choose New Folder from the File menu.

3) Type in a name for the new folder, then click New Folder. A button for the new folder will appear on your user panel.

Open Other (optional)

• Keyboard Shortcut: Apple-key, O

This command allows you to open programs or documents. If you have access privileges to open items anywhere, you can open any item on any disk using this command. If not, this command lets you open only those items on your user panel.

To open an item:

1) Choose Open Other from the File menu.

2) If necessary, use the pop-up menu (above the window with the list of items) to move to a different level or a different disk.

3) Click on the item you want to open, then click Open. The Open Other screen disappears and the window of the selected item appears.

Close

• Keyboard Shortcut: Apple-key, W

This command allows you to close any window that is currently open. It does not close the At Ease Items panel or the User Items panel.

Rename (optional)

• Keyboard Shortcut: Apple-key, R

This command allows you to rename any document or folder on your user panel.

1) If necessary, click the tab of the user panel to bring it to the foreground.

2) Choose Rename from the File menu.

3) Click on the item you want to rename, then click Rename.

4) Type a new name for the item in the text box, then click Rename.

Delete (optional)

• Keyboard Shortcut: Apple-key, D

This command allows you to delete any document or folder on your user panel. Deleting a folder also deletes its contents permanently.

To delete an item:

1) If necessary, click the tab of the user panel to bring it to the foreground.

2) Choose Delete from the File menu.

3) Select the item you want to delete by clicking on it.

4) Click Delete.

5) To permanently delete the item, click delete again.

Get Info (optional)

• Keyboard Shortcut: Apple-key, I

This command give you information about any item on either At Ease panel. To get information about an item:

1) Click the tab of the panel that contains the item you want information about.

2) Choose Get Info from the File menu.

3) Select the item you want information about by clicking it, then click Get Info. An information box appears for you to read.

4) Click OK when you're done reviewing the information.

Find (optional)

• Keyboard Shortcut: Apple-key, F

This command helps you find items on either At Ease panel. To find an item:

1) Choose Find from the File menu.

2) Type the name (or part of the name) of the item you're looking for in the

text box. Be sure, if you type the whole name, to type it exactly, including spaces and punctuation.

3) Click Find.

4) Select the name of the item you're looking for from the list shown. Information about the item will appear below it, and the Go To button will become active.

5) Click Go To, and the Find screen disappears. You will see the panel where the item is located, and its button will flash.

Copy to Floppy (optional)

• No Keyboard Shortcut

This command allows you to copy items from your user panel onto a floppy disk. To copy onto a floppy disk:

1) If necessary, click the tab of the user panel to bring it to the foreground.

2) Choose Copy to Floppy from the File menu. If there is not a floppy disk in the drive, At Ease will prompt you to insert one.

3) Select the item you want to copy. To select more than one item, hold down the shift key while you click each name.

4) Click Copy. At Ease will show you the progress of the copying process. When the message disappears, the process is complete.

Copy From Floppy (optional)

• No Keyboard Shortcut

This command allows you to copy items from a floppy disk onto your user panel. To copy from a floppy disk:

1) If necessary, click the tab of the user panel to bring it to the foreground.

2) Choose Copy From Floppy from the File menu.

3) Select the item or items you want to copy.

4) Click Copy. A message appears showing the progress of the copying process. When the message disappears, the process is complete.

Quit

• Keyboard Shortcut: Apple-key, Q

This command returns you to the At Ease Welcome screen. From there you can

shut down the computer, or another user can start up with At Ease. (If there is only one At Ease user, this command does not appear.)

THE EDIT MENU

- Keyboard Shortcuts:

Undo:	Apple-key, Z
Cut:	Apple-key, X
Copy:	Apple-key, C
Paste:	Apple-key, V
Select All:	Apple-key, A

All users see the same Edit menu commands. The commands work the same as those in an application's Edit menu. They are available when you have selected a command that asks you to enter text (such as Rename or Find in the File menu).

THE VIEW MENU

- No Keyboard Shortcuts

You will only have access to the View commands if you have full menu access privileges. These commands let you change the way items on either At Ease panel are organized. To change your view:

1) Click the tab of the panel whose organization you want to change.

2) Choose a view from the view menu. There are four options:

   - By Name -- organizes the items alphabetically.

   - By Size -- organizes the items according to size, starting with the largest. When the pointer moves over an item in the View By Size mode, the item's size is displayed below its name.

   - By Kind -- organizes the items in alphabetical order by category (application, document, etc.). Also documents are organized by the application in which they were created. When the pointer moves over an item in the View By Kind mode, the item's kind is displayed below its name.

   - By Date -- organizes items by the date they were last modified, starting with the most recent. When the pointer moves over an item in the View By Date mode, the date the item was last modified is displayed below its name.

THE SPECIAL MENU

What commands you may see depends on your menu access privileges.

Turn Sound Off

- No Keyboard Shortcut

This command lets you turn off the sounds At Ease makes when executing tasks like turning a page, clicking a button, etc. When you select Turn Sound Off, the menu command becomes Turn Sound On.

Eject Disk

• Keyboard Shortcut: Apple-key, E

This command lets you eject a floppy disk. If there is more than one disk present, you will see a list of disks to choose from. If there is only one disk, the command will read "Eject <disk name>".

Go To At Ease Setup (may require a password)

• No Keyboard Shortcut

This command takes you to the At Ease Setup program, where access privileges can be set. If the At Ease owner has set an administrator password, you will need to enter it to gain access.

Go To Finder (optional)

• No Keyboard Shortcut

This command is available if you have the access privileges to switch to the Finder. Choosing this command brings the Finder forward; At Ease will still be running in the background. You can go back to At Ease by selecting Go To AT Ease from the File menu of the Finder.

Restart

• No Keyboard Shortcut

This command restarts the computer. Any floppy disks are ejected in this process, and applications are automatically quit. The first thing you will see when the computer restarts is the At Ease welcome screen.

Shut Down

• No Keyboard Shortcut

This command shuts down the computer so that it is safe to switch off the power. Any disks are ejected and applications quit.

Macintosh AP and UPI Solutions: A Listing (9/93)

Revised: 9/16/93
Security: Everyone

Macintosh AP and UPI Solutions: A Listing (9/93)

==========

Article Created: 16 September 1993

TOPIC ----------

My university is ordering Macintosh computers to replace old terminals for the production of our newspaper and magazine publications. I need current information dealing with connectivity to AP (Associated Press) and UPI (United Press International) news feeds.

DISCUSSION ----------

We checked the Redgate Buyers Guide on AppleLink, performed a periodical search, and also contacted AP in New York for their recommendations. To locate a vendor's address and phone number, use the vendor name as a search string.

- Crosfield Inc's Newsline Solo, a wire photo receiver and transmitter kit, is reportedly popular in Canada but is also distributed in the United States.

- Mainstream Data Inc's Mainstream Newscast uses FM band or satellite dish to deliver leading news wires directly to Macintosh computers. Mainstream's software runs in the background and lets users clip stories on particular topics. Several wire services, including Reuters, Dow Jones and The Associated Press, use Mainstream's technology to deliver news.

- WireManager by Baseview Products, Inc.
  Business And Professional Software
  Wire capture and story management
  Macintosh Plus or larger; 1 MB of RAM; System 6.0.5 or later.

  WireManager was developed for the news publishing and broadcasting industry. It sorts through the wire, automatically placing stories where users want them. It is available in low- and high-speed formats to capture AP, UPI, Canadian Press, Reuters, broadcast wires and foreign

language wires, including AFP, EFE and Notimex. The program puts stories to primary and backup paths and creates the subject directories asked for. When used in conjunction with Baseview's IQue database, searches can be tailored to specific tasks, cutting back on the time wasted searching the wires. WireManager is designed as a primary wire capture package for multiuser environments, but can also function equally well in single-user environments. Copy management can be made even easier with NewsEdit, Baseview's editorial program, but WireManager is compatible with all major word processing and layout programs, MultiFinder and AppleShare. WireManager's AppleShare setup allows the creation of "read only" and "group access" folders.

- The Internet has become a medium for bulk information service delivery. Dow Jones News Retrieval, Dialog, AP, UPI, Reuters, Mead Data, Lexis/Nexis, and LEGI-Slate.

- Dialog Information Services, Inc. offers more than 400 databases and two terabytes of data.

- Dow Jones News/Retrieval gives users access to more than 1,300 publications and 70 databases.

- Numerous consumer BBs offer access to UPI and AP (typically for read access only - you must check with the supplier):

  America Online Inc.
  ClariNet Communications Corp.
  CompuServe Inc.
  DataTimes
  Dialog Information Services, Inc.
  Dow Jones & Co.
  GE Information Services
  Mainstream Data Inc.
  Mead Data Central Inc.
  NewsNet Inc.
  Prodigy Services Co.
  Ziff Desktop Information

- The Associated Press distributes PhotoExpress, a service that sends non-AP photos via PhotoStream. PhotoStream transmits photos in digitally compressed format. Advances in compression technology allows AP to offer the service to non-AP newspapers and distributors.

  They also distributes AP MacArchive, which enables users to store and retrieve digital image files from the AP's image-handling system. AP MacArchive is Mac-based and utilizes Aldus Fetch to store and retrieve files.

  AP recommends the university contacts their local AP Bureau for consultation. The local bureaus are said to be very familiar with Macintosh connectivity and solutions. AP as well recently came out with a new Macintosh solution called NewsHound. It is a database with a HyperCard search engine.

PostScript Printer Description Files: Naming Rules (9/94)

Revised: 9/1/94
Security: Everyone

PostScript Printer Description Files: Naming Rules (9/94)

==========

Article Created: 8 September 1993
Article Reviewed/Updated: 1 September 1994

TOPIC ----------

What is the syntax or rules, if any, for properly naming PostScript Printer Description (PPD) files so they work properly with LaserWriter driver 8.0?

DISCUSSION ----------

There really is no "standard" for naming PPD files. If there are any naming conventions required for the files, those conventions will be application specific. For example, PageMaker 4.2a requires that the PPD filename end with ".PPD" and is located in a specific folder within the System Folder.

With regard to LaserWriter driver 8.0, all PPD files will work with the driver regardless of their name. Generally speaking, PPD files are named after the printer model name stored in the printer's ROMs. If the PPD files are named something different, those files will still work fine since the driver looks at the contents of the PPD file. The only possible loss of functionality in this case would be with the "Auto Setup" feature.

With "Auto Setup," LaserWriter driver 8.0 first queries the printer for its Model Name and PostScript ROM version stored in its ROMs. It then takes this information and looks for an associated PPD file with either of the following criteria:

- PPD filename matches Model Name exactly (that is, Apple LaserWriter IIf)
- PPD filename matches Model Name with version (in other words, Apple LaserWriter IIf v2010.113)

If either of the above criteria are not met, then the driver asks to manually select the PPD. Once selected, the PPD file will work fine. Again, unless the application using the PPD file has specific requirements for PPD filenames, it really is the contents of the file that's most important.

LW Driver 8.0: Different Printer Icons in the Chooser (9/93)

Revised: 9/8/93
Security: Everyone

LW Driver 8.0: Different Printer Icons in the Chooser (9/93)

==========

Article Created: 8 September 1993

TOPIC ----------

When using the LaserWriter Driver 8.0, (to select a printer in the Chooser) I noticed that there are several different printer icons that appear in the Chooser. What do these icons represent?

DISCUSSION ----------

There are a total of four different icons that can appear when selecting a printer using the LaserWriter 8.0 driver.

1. The standard icon resembles a black and white laser printer with a piece of paper containing two ampersands emerging from the printer. This icon is displayed whenever a black and white PostScript printer with a resolution less than or equal to 600 DPI is selected.

2. If a color printer is chosen then the two ampersands are replaced by a piece of paper with a rainbow of colors on it.

3. A small magnifying glass appears whenever the chosen printer has a print resolution exceeding 600 DPI.

4. If a print spooler is chosen, then an icon representing a spool of thread will be displayed.

LaserWriter Driver 7.2 and Earlier: Helvetica Font Bug (9/93)

Revised: 9/8/93
Security: Everyone

LaserWriter Driver 7.2 and Earlier: Helvetica Font Bug (9/93)

==========

Article Created: 8 September 1993

TOPIC ----------

When using Helvetica bold underline, the underline only goes under about three quarters of the word or sentence. The underline command works fine with plain Helvetica, but not when you bold. I have reinstalled the fonts and the problem still exists.

DISCUSSION ----------

There is a known bug in previous versions of the LaserWriter driver (version 7.2 or earlier) where the problem outlined can occur. The problem is due to how the driver calculates the underlining as opposed to how the application calculates it.

This problem has been fixed in LaserWriter driver version 8.0. Try using this version of the driver.

AppleShare Print Server: Prevent Error Page Printing (9/94)

==========

Article Created: 9 September 1993
Article Reviewed/Updated: 27 September 1993

TOPIC ----------

I'm using AppleShare File and Print Server 3.0.2 and I'm having the following problem with the print server. Every time a print job is canceled or an error occurs, a report is printed notifying me the job has been canceled or there has been an error. This is no problem on a printer with ordinary paper, but it is a problem on a printer with film because it wastes film.

Is it possible to change the print server in someway to disable this feature?

DISCUSSION ----------

Here is how to prevent Error pages from printing on all printers captured by the AppleShare Print Server.

1) Using ResEdit open the AppleShare Print Server.

2) Open the "EXOP" resource.

3) Open the resource ID 128.

4) Change the first four zeros to ones.

5) Quit ResEdit and Save the changes.

Express Modem Software: Using with Fax/Data Modem (4/95)

==========

Article Created: 10 September 1993
Article Reviewed/Updated: 24 April 1995

TOPIC ----------

This information only applies to PowerBook Fax/Data Modem (2400 bps) users.

DISCUSSION ----------

Using the Express Modem software with the PowerBook Fax/Data Modem requires that the Serial Tool be installed in the Extensions folder.

The Serial Tool is installed in one of two ways:

• If you already have the older Fax Sender software installed on your system, the Serial Tool will remain on your system after installing the new Express Modem software.

• You can manually drag the Serial Tool into your Extensions folder.

These articles can help you locate software updates mentioned here:

• Where To Find Apple Software Updates
Lists online services for "free" Apple software updates.

• Obtaining Apple Product Support in the USA
Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Article Change History:
24 Apr 1995 - Added info on where to find software updates online.

Revised: 9/9/93
Security: Everyone

OneScanner w/Accessory Kit for Windows: Kits Contents (9/93)

==========

Article Created: 9 September 1993

TOPIC ----------

I have a question regarding the prices pages for the Apple OneScanner w/Accessory Kit for Windows. The description of the product says that it "Requires appropriate cables. Includes Apple OneScanner (C0187LL/A) w/Accessory Kit (C0217LL/A)."

I thought a cable shipped with the accessory kit? If it doesn't, what does "Requires appropriate cables" mean? Does Apple make the appropriate cables and if we do what is the part number?

DISCUSSION ----------

The comment "Requires appropriate SCSI cables is ambiguous and applies only to the Macintosh bundle. We've requested the Price Pages be reworded to more accurately represent what the accessory kits contain.

B0634LL/A The Apple OneScanner w/Accessory Kit (for Windows™) includes:

- documentation & software
- SCSI I/F Card, cable & terminator

B0634LL/C The Apple OneScanner w/Accessory Kit (this is the Macintosh bundle) includes:

- documentation & software

Macintosh AV Systems: Source for Stereo Y-Adapter (4/95)

Revised: 4/4/95
Security: Everyone

Macintosh AV Systems: Source for Stereo Y-Adapter (4/95)

==========

Article Created: 10 September 1993
Article Reviewed/Updated: 04 April 1995

TOPIC ----------

What do I need to connect my Macintosh AV system to a stereo system?

DISCUSSION ----------

The Macintosh AV system computers (Quadra 840AV, Centris 660AV, and Power Macintosh with AV card) can record stereo audio to a hard disk from most audio sources such as VCRs, televisions, amplifiers, and CD, LP, and cassette players by directly connecting their sound out cables to the computer. The sound files stored on the hard drive can then be edited by using software on the computer.

Stereo audio input for the Macintosh AV computers requires a "Stereo-Y-Adapter" to connect the two RCA plugs (commonly used in audio equipment) to the 3.5mm stereo mini-jack on the rear of the Macintosh (indicated by the microphone icon).

Apple does not offer this adapter with the Macintosh AV system computers. A similar adapter (mono only) was included with previous Macintosh computers.

Functional adapters are available from electronics stores and hi-fi retailers nationwide.

Article Change History:

PowerBook 145B Plus Pack: Technical Specifications (6/96)

==========

Article Created: 13 September 1993
Article Reviewed/Updated: 5 June 1996

TOPIC ----------

This article provides the technical specifications for the Apple PowerBook 145B Plus Pack.

DISCUSSION ----------

Microprocessor

- Motorola 68030, running at 25 MHz

Memory

- Comes with 4 MB of pseudostatic RAM (PSRAM)
- Expands to 8 MB of RAM with the addition of a 4-MB PSRAM expansion card
  Disk storage
- One built-in 1.4-MB Apple SuperDrive disk drive that uses high-density floppy disks and reads, writes, and formats Macintosh, MS-DOS, OS/2, and ProDOS disks
- One internal 80-MB hard disk drive

Display

- 10-in. (254 mm) diagonal
- Backlit supertwist passive-matrix display, 640 by 400 pixels

Battery

- Nickel-cadmium which provides 2 to 3 hours of portable computer use before recharging is necessary

Keyboard

- Built-in keyboard with standard Macintosh layout
- Two-level tilt adjustment

Trackball

- 30-mm (approx. 1.25-inch) diameter, two buttons

Clock/Calendar

- CMOS custom-integrated circuit with long-life lithium battery

Interfaces

- One Apple Desktop Bus (ADB) port for keyboard, mouse, and other input devices
- Two RS-422 serial ports for LocalTalk networking, printers, modems, and other devices
- One HDI-30 SCSI port for hard disks, scanners, CD-ROM drives, and other devices
- One sound-out port for external audio amplifier or headphones
- One sound-in port

Modem

- Internal PowerPort Bronze 2400-bps modem from Global Village Communication with fax send/receive at 9600 baud; includes fax send/receive software and ZTerm software

Sound Generator

- Apple Sound Chip provides 8-bit sound and is capable of driving stereo headphones or other stereo equipment. These devices connect to the Apple Sound Chip through the sound port.

Sound input

- 8-bit sound, sampled at 11 or 22 kHz

Disability Access

- CloseView, Easy Access, and visible-beep software are included with system software. These built-in third-party options provide alternative means of input and output for people with disabilities.

ADB Power Requirements

- Maximum current draw for all ADB devices is 200 mA (milliamps) (a maximum of three ADB devices is recommended)

Electrical Requirements

- Line voltage: 110 to 220 V
- Frequency: 50 to 60 Hz

Environmental Requirements

- Operating temperature: 50° F to 104° F (10° C to 40° C)
- Storage temperature: -13° F to 140° F (-25° C to 60° C)
- Relative humidity: 20% to 80% noncondensing
- Operating altitude: 0 to 10,000 ft. (0 to 3048 m)
- Maximum storage altitude: 15,000 ft. (4722 m)

Size and Weight

- Height: 2.25 in. (5.7 cm)
- Width: 11.25 in. (28.6 cm)
- Depth: 9.3 in. (23.6 cm)
- Weight: 6.8 lb. (3.03 kg)

AppleShare 3.0.3 Patch (11/95)

==========

Article Created: 10 September 1993
Article Reviewed/Updated: 4 November 1995

TOPIC ----------

This article describes where to find the AppleShare 3.0.3 Patch on AppleLink, and the AppleShare 3.0.3 Patch Read Me First information.

DISCUSSION ----------

AppleShare 3.0.3 Patch is available. These articles can help you locate this software update:

• "Where To Find Apple Software Updates" -- Lists online services for free Apple software updates.

• "Obtaining Apple Product Support in the USA" -- Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library.

AppleShare 3.0.3 Patch - Read Me First

AppleShare 3.0.3 is the latest maintenance release of the AppleShare 3.0 product. It fixes problems found in the AppleShare 3.0, 3.0.1, and 3.0.2 releases.

Version 3.0.3, also fixes some incompatibilities between AppleShare and AOCE, and AppleShare and AppleSearch. It is recommended that you upgrade your AppleShare server to version 3.0.3 if you will be running either AOCE or AppleSearch on your server.

The AppleShare 3.0.3 patch application will upgrade your AppleShare 3.0, 3.0.1, or 3.0.2 product to AppleShare 3.0.3. It will upgrade the file server and AppleShare Admin to version 3.0.3. It will not upgrade the print server.

There are actually four different patch applications available. Choose the one that is appropriate for the language of AppleShare you are using.

IMPORTANT NOTICE:
If you have previously upgraded your AppleShare 3.0 or 3.0.1 server to AppleShare 3.0.1 Rev. B, you must replace your Rev. B File Server Extension file with either the 3.0 or 3.0.1 version prior to running the AppleShare 3.0.3 Patch Program.

To perform the upgrade, follow these steps:

1) Quit all applications that are currently running on your server.

2) Turn off any virus detection software.

3) Open the patch application. A text box with important information will appear.

4) Click Patch after reading the information in the text box.

5) Reboot your system.

Apple MessagePad: Moving Items to Memory Card (5/95)

Revised: 5/5/95
Security: Everyone

Apple MessagePad: Moving Items to Memory Card (5/95)

==========

Article Created: 9 September 1993
Article Reviewed/Updated: 5 May 1995

TOPIC ----------

How do I move items, such as notes, names or Calendar items, from my Apple MessagePad's main memory to a PCMCIA memory card?

DISCUSSION ----------

There are three ways to move items from the Apple MessagePad's memory to a PCMCIA memory card:

1) Use the Newton Connection Kit to synchronize your Apple MessagePad with a computer, then restore the data to the Apple MessagePad's memory card. You can only move notes and name cards with this method.

2) Copy individual items or groups of items to your memory card. You can move notes, name cards, or Calendar items with this method.

3) Remove software applications from your Apple MessagePad, then download them to your MessagePad's memory card.

Using the Connection Kit
==========

To use the Connection Kit to move notes and name cards to a memory card, you must synchronize your Apple MessagePad with a computer. Be sure to have the PCMCIA card inserted into your Apple MessagePad. This produces two synchronization files -- one for your Apple MessagePad and one for your memory card.

To move name cards

Step 1:

Open your Apple MessagePad synchronization file, then tap twice on Name File and select all the names from the Name File window.

Step 2:
Choose "Cut Name File Entries" from the Edit Menu. Then open the memory card synchronization file and tap twice on Name File.

Step 3:
Choose "Paste Name File Entries" from the Edit Menu. This places all the names on the memory card.

To move notes

Step 1:
Open the Apple MessagePad synchronization file, then tap twice on Notepad and select all the names from the Notepad window.

Step 2:
Choose "Cut Notes" from the Edit Menu. Then open the memory card synchronization file and double-click on Notepad.

Step 3:
Choose "Paste Notes" from the Edit Menu. This places all the notes on the memory card.

After you have moved your name cards and notes, synchronize your Apple MessagePad again. Your names and notes are now moved to your memory card.

Copying Items
==========

You can move individual names or notes by tapping the envelope icon and choosing "Move To Card," but individual Calendar or To Do items can not be moved with this method. If you have many items to move or you need to move all your Calendar items, follow these steps:

To move Notes and Calendar items to your memory card

Step 1:
Tap the Find button, then tap Look For and choose "dates after".

Step 2:
Enter an early date such as 1/1/80 and tap All. The Apple MessagePad displays an overview of all Notes and Calendar appointments created after the specified date.

Step 3:
Tap on the Envelope icon and choose Move to Card.

To move Name, ToDo items or Calendar day notes

Step 1:
Tap the Find button, then tap Look For and choose Text.

Step 2:
Enter the letter "a" and tap All. The Apple MessagePad displays a list of items that contain the letter "a".

Step 3:
Tap on the Envelope icon and choose Move To Card. Repeat this step for other letters in the alphabet. You should be able move all your items to your memory card by repeating these steps with all the vowels.

Moving Software Packages

Step 1:
Tap the Extras button, then tap Prefs.

Step 2:
Tap Memory in the Preferences menu, then tap Remove Software. Tap the name of the software applications that you want to move. This removes these software applications from main memory.

Step 3:
Tap X twice to return to the Extras drawer, then tap Card. Tap Store new items on card, then tap X again.

Step 4:
Reinstall your software applications with the Connection Kit. They are stored on the memory card.

Newton MessagePad: Name Cards Don't Appear in Overview (9/93)

Revised: 9/10/93
Security: Everyone

Newton MessagePad: Name Cards Don't Appear in Overview (9/93)

==========

Article Created: 9 September 1993

TOPIC -----

When I list the cards in my Name File (by tapping the dot at the bottom of the screen), the cards aren't listed alphabetically by company name and don't appear next to the first letter in the company name.

For example, I have a card with a company called "Telephone Company" and it does not show up under the T's in the list.

Why is this?

DISCUSSION -----

When you list your Newton MessagePad's Name File, the name cards will be displayed in alphabetical order based on either last name or company name.

If a name card only has a company name and its last name field is empty, it will not be placed under a letter in the overview list. Instead, it will be put at the top of the list with no letter next to it. To display such a card in alphabetical order by last name, you must:

1) Use the Find function to find the appropriate card. Tap Show, then tap All Info.

2) Tap List by, then tap Last Name.

The same problem can also occur if you select List by Company, but the name card has no data in the company field. To display such a card in alphabetical order by company, you must:

1) Use the Find function to find the appropriate card. Tap Show, then tap All Info.

2) Tap List by, then tap Company.

Newton MessagePad: Proper Names Have Separate Word List (9/93)

Revised: 9/27/93
Security: Everyone

Newton MessagePad: Proper Names Have Separate Word List (9/93)

==========

Article Created: 27 September 1993

TOPIC -----

If I write the word "Developer" into the Last Name or Company field of a name card, the Newton MessagePad won't recognize it properly, even though the word "Developer" is entered in the user word list.

When I type "Developer" on the keyboard, however, it is recognized quite easily.

Why is this?

DISCUSSION -----

The proper names word list and the user word list are stored in separate dictionaries on your MessagePad. The Last Name and Company fields in the Name File use the proper names word list to recognize text. When you enter a name into a new name card, the MessagePad uses only the proper names word list to look up and match the text you have entered.

Since the word "Developer" is entered in the user word list, the MessagePad won't recognize it and place it into a name card.

The built-in keyboards look at all word lists to recognize words, so the word "Developer" would be recognized and placed into the Note Pad or Calendar.

At Ease 2.0: System Requirements and Installation (12/95)

Revised: 12/4/95
Security: Everyone

At Ease 2.0: System Requirements and Installation (12/95)

==========

Article Created: 14 September 1993
Article Reviewed/Updated: 4 December 1995

TOPIC ----------

This article lists the system requirements for At Ease 2.0 and describes how to install it.

DISCUSSION ----------

If you purchased a Macintosh Performa computer with At Ease already installed, you do not need to go through the installation procedure. If At Ease was installed at the factory, you also may not have received the disks described in this article.

System Requirements

At Ease 2.0 runs on Macintosh computers with:

• at least 2MB of RAM (4MB is recommended)

• System software 7.0 or later

• an internal or external hard disk drive

Installation
==========

Make sure you have the At Ease 2.0 Install disks, which contain the At Ease program and related files.

Step 1

Turn on your Macintosh.

Step 2

Insert the At Ease 2.0 Install 1 disk.

Step 3

Double-click the Installer icon to begin the installation process. You see a screen that welcomes you to the Installer, and explains the installation process.

Step 4

After you have read the welcome screen, click OK. You see a new screen labeled Easy Install. Make sure the disk named for installation is your startup disk. If not, click Switch Disk until you see the name of your startup disk.

Step 5

Click the Install button. A status screen shows you the progress of the installation. Whenever the computer needs information from another disk, it ejects the current disk and display a message indicating which disk you should insert next.

Step 6

Insert the At Ease 2.0 disks as requested. When installation is complete, you see a message indicating the process was successful.

Step 7

Click Restart to quit the Installer program and restart your computer. You are now ready to set up At Ease 2.0 for use.

QuickTime Thumb Nails (9/93)

Revised: 9/14/93
Security: Everyone

QuickTime Thumb Nails (9/93)

==========

Article Created: 13 September 1993

TOPIC -----

QuickTime 1.5 and later versions add the ability to see thumb nails of graphics files in the open dialog box of some applications. I have these questions:

- Does the application have to implement this feature?
- What determines whether this feature shows up in a dialog box?
- What are all the file types that QuickTime can generate thumb nails for?

DISCUSSION -----

QuickTime includes extensions to the Standard File Package that allow you to create and display file previews -- information that gives the user an idea of a file's contents without opening the file. Typically, a file's preview is a small PICT image (the thumb nail), but previews may also contain other types of information that is appropriate to the type of file. For example, a text file's preview might tell when the file was created and what it discusses.

"Inside Macintosh: QuickTime" has this to say:

"The Movie Toolbox provides two new Standard File functions, StandardGetFilePreview and CustmGetFilePreview, that allow you to display file preview in an open dialog box in System 7 using Standard File reply structures (of type StandardFileReply). The StandardGetFilePreview function corresponds to the existing StandardGetFile function; the CustomGetFilePreview function corresponds to the existing CustomeGetFile function.

"You use these new functions in place of the existing standard file

functions whenever you want to allow the user to display previews during the Open dialog box."

So, whatever you want to display can be previewed based on what the programmer of the application has programmed.

Easy Access: Saving Settings Between Restarts (1/95)

==========

Article Created: 13 September 1993
Article Reviewed/Updated: 3 January 1995

TOPIC ----------

I need a way to get the Easy Access settings to persist between restarts.

I use a headset to navigate on the Macintosh. I use Easy Access and would like a way for it to automatically be active when I start up the Macintosh. Currently, I have to press the shift key 5 times in succession, or open the control panel and manually select "On" each time I starts the Macintosh to activate Easy Access.

Are you aware of any way to have the Easy Access setting stay on between restarts?

DISCUSSION ----------

This was fixed with System Update 3.0. Below is the section on Easy Access from it's Read Me file.

Updates the Easy Access control panel to version 7.2. This new version allows Sticky Keys to remain active after waking up if it was active when the PowerBook or Portable went to sleep. Also, Easy Access now remembers whether sticky keys, mouse keys, and slow keys were on or off between restarts.

Article Change History:

Install Me First CD: Booting Into At Ease (8/95)

Revised: 8/14/95
Security: Everyone

Install Me First CD: Booting Into At Ease (8/95)

==========

Article Created: 13 September 1993
Article Reviewed/Updated: 14 August 1995

TOPIC ----------

Why does the Install Me First CD sometimes startup into At Ease and sometimes it does not?

DISCUSSION ----------

There are two ways to startup from the Install Me First CD:

- Select the CD-ROM as the startup device in the Startup Disk control panel and restart. This will startup into At Ease.

- Bypass the internal hard disk by starting up with the Command-Option-Shift-Delete key combination held down. This may or may not launch At Ease at start up, depending on how long the Shift key is held.

The way At Ease and the system software are installed on the Install Me First CD does not allow disabling of extensions at startup. There is also no message indicating the extensions are off. At Ease will not be disabled if you hold down the Shift key until the "Welcome To Macintosh" is displayed.

It appears that At Ease acts more like a startup application than a control panel or cdev. The Shift key bypasses At Ease during startup, but ONLY if the key is held down AFTER the "Welcome to Macintosh" screen is displayed.

If At Ease is preferred and did not load, follow these steps:

Step 1

Choose the Startup Disk Alias under the Apple Menu.

Step 2

```
------
Select the CD-ROM.

Step 3
------
Restart with no keys held down. This will launch At Ease at startup.

Newton MessagePad: When Letter Styles Don't Stay Selected (9/93)

Revised: 9/14/93
Security: Everyone

Newton MessagePad: When Letter Styles Don't Stay Selected (9/93)

==========

Article Created: 14 September 1993

TOPIC----------

If I select a letter in the Letter Styles Preference, then tap Rarely, often the Rarely button will darken momentarily, then the selection goes back to Sometimes.

Why is this?

DISCUSSION----------

You must choose Sometimes for at least one Letter Styles selection in both upper and lower case of each character. The Newton MessagePad will not allow changing all upper or lower case letter choices for each character to "Rarely."

When you select Cursive Only or Printed Only in the Handwriting Style Preferences, your Letter Styles Preferences become limited to cursive or printed styles, respectively.

PowerBook 165: Express Modem Cannot Be Used... Message (9/93)

Revised: 7/8/94
Security: Everyone

PowerBook 165: "Express Modem Cannot Be Used..." Message (9/93)

==========

Article Created: 16 September 1993

TOPIC ----------

Some customers have reported problems with the PowerBook 165 and the Express Modem. When they access the Express Modem, a message appears stating "The Express Modem cannot be used with this PowerBook."

DISCUSSION ----------

Some PowerBook 165 systems were shipped with two different enablers:
• version 1.0.2 on the hard drive
• version 1.0.3 on a floppy

Version 1.0.2 is the problem. The solution is to replace it on the hard drive with version 1.0.3, which works properly with the PowerBook 165 and Express Modem.

In general, Apple recommends using the latest version of an Enabler. If you get the message "The Express Modem cannot be used with this PowerBook" you should compare the version of the Enabler installed in your Macintosh's System folder to the version of the Enabler that comes with the Express Modem software -- and use the later of the two. Here's how:

1) Drag the old Enabler out of the System Folder (but not into the Trash).

2) Drag the new Enabler into the System Folder.

3) Restart.

4) Throw away the old Enabler.

Macintosh AV Series: Video Conferencing (10/93)

Revised: 10/4/93
Security: Everyone

Macintosh AV Series: Video Conferencing (10/93)

==========

Article Created: 15 September 1993
Article Reviewed/Updated: 4 October 1993

TOPIC ----------

I want more information about the feasibility of teleconferencing with a Macintosh AV series computer to my headquarters in Europe. I have a digital phone system available.

- Can both audio and visual signals be sent over a single telephone line? The demo I saw appeared to be doing video over Ethernet, while one document I've seen indicates that some type of AppleTalk connection is required for teleconferencing.

- Besides the camera, what additional hardware or software is required, some kind of GeoPort? What kind of results can the I expect, for example quality of signals?

DISCUSSION ----------

Several products, including the bundled ES•F2F product, support the Macintosh AV series and can connect with other computers via AppleTalk, ISDN, many of the Comm (communications) toolbox tool, and ordinary telephone lines.

Other products which provide videoconferencing for Macintosh include Cameo Personal Video System from Compression Labs, ShareView Plus from ShareVision Technology and the MovieStar Videoconferencing Toolkit from Intelligence At Large. For specific details on each product, please contact the individual vendors.

To locate a vendor's address and phone number, use the vendor name as a search string.

Article Change History:
4 October 1993 - Changed title to include the Macintosh AV Series, deleted some incorrect information and added some additional third party

product information.

AppleShare 3.0.3 Patch and Change History (11/95)

Revised: 11/6/95
Security: Everyone

AppleShare 3.0.3 Patch and Change History (11/95)

==========

Article Created: 15 September 1993
Article Reviewed/Updated: 4 November 1995

TOPIC ----------

Can you tell us what changes were made in AppleShare 3.0.3?

DISCUSSION ----------

AppleShare 3.0.3 Change History

Release dates:

- version 3.0.1 (9/92)
- version 3.0.2 (6/93)
- version 3.0.3 (9/93)

Notes:
All patches are incremental. All changes made in 3.0.1 are incorporated in 3.0.2, and all changes in 3.0.2 are incorporated in 3.0.3. Therefore, customers upgrading from 3.0, 3.0.1, or 3.0.2 to 3.0.3 will be running the most recent version of AppleShare file server.

AppleShare 3.0.1

The following fixes and enhancement were made in AppleShare 3.0.1:

File Server 3.0.1

- Fixed incompatibilities between CE Software (QuickMail 2.5) and AppleShare 3.0.

- When one client duplicated a large (several MB) file on the server, other clients would hang. The problem has been corrected so that the server will better service other requests during the duplication.

- Fixed a problem involving AppleShare and Retrospect Remote where if the Users & Groups file was backed up by Retrospect, users could no longer log into the server.

Admin 3.0.1

- "Users" folder access privileges incorrectly changed from explicit to inherited after the menu item "Verify Apple II Startup Info" was selected.

- AppleShare 3.0.1 now repairs damaged btree files. This fix eliminates occasional 2.0 to 3.0 upgrade failures.

- On System 7.1 the Admin in AppleShare 3.0 could not delete a user or group without hanging the machine with the File Server running. AppleShare 3.0 version 3.0.1 is now compatible with System 7.1.

- Fixed problems involving AppleShare 3.0's "Copy Item too…" feature where copy would terminate with a "file not found" error if it encountered an invisible folder at the root of source folder.

- There was an occasional inherited privileges problem when updating from AppleShare 2.0 to 3.0. Access privileges were sometimes upgraded incorrectly user AppleShare 3.0.

- Selecting the menu item "Compact volume Access Privileges" caused launch limit settings to be lost.

- AppleShare 3.0 "Summary of Shared Item Report" did not work correctly. The report would sometimes show an incorrect owner and group with incorrect privileges. If you looked at the server itself, the privileges were set correctly; it was just that the report that was incorrect.

Print Server 3.0.1

- The AppleShare Print Server previously did not properly handle contiguous paper feed on ImageWriter printers. (Extras <CRs> were issued when printing continuously with feed paper through an ImageWriter II. The beginning of each subsequent page started further down on the page.)

- If many Macintosh clients were using the Print Server a lot, the Print Server could freeze up.

- If many Apple II clients were spooling to the Print Server, the clients that tried to talk to the Print Server, after the ninth client, would report problems communicating with the printer. This problem was in the AppleShare Print Server and the Apple II client software. AppleShare Print Server 3.0.1 will continue to work the older Apple II clients, but for full robustness and future compatibility it is recommended that users upgrade the Apple II client software to version GS/OS 6.0.1.

- If the AppleShare Print Server and the AppleShare File Server were

running on the same Macintosh under heavy stress, it was possible for the Macintosh to crash or freeze up. Users will need to upgrade the AppleTalk drivers on their server Macintosh's by using the Network Software Installer version 1.2.3 or greater.

AppleShare 3.0.2

The following fixes and enhancements were made in AppleShare 3.0.2:

- Allows Retrospect to properly back up the Users and Groups file. Previously caused an error whereby the file was left open and AppleTalk Remote Access clients couldn't dial into the network after a backup. There was no effect on AppleShare clients.

- Ups Max Cur Requests from 5 to 16 (although only 8 can be used) reducing the chance that a slow network link client (like an AppleTalk Remote Access client) will get a server timeout and hang until it retries.

- Fixes a bug related to B-Tree files that caused file system problems resulting in Open Error messages on random files once the bug occurred. Products that cause this bug to happen are: AppleSearch, AOCE, and other third party server products.

AppleShare 3.0.3

The following fixes and enhancements were made in AppleShare 3.0.3:

- Version 3.0.3 fixes some incompatibilities between AppleShare and AOCE and AppleShare and AppleSearch. It is recommended that customers upgrade their AppleShare servers to version 3.0.3 if they will be running either AOCE or AppleSearch on their server.

Retrospect A/UX - 32000 File Limitation (9/93)

Revised: 9/16/93
Security: Everyone

Retrospect A/UX - 32000 File Limitation (9/93)

==========

Article Created: 15 September 1993

TOPIC ----------

The A/UX version of Retrospect has a limitation brought from the Macintosh version. It is the limitations of 32,000 files when storing or restoring a volume.

The error message, "Error -24062 (limited to 32000 files/folders)", is still in the A/UX version of the product. This puts some restrictions on what users can plan to backup with an Apple Workgroup Server (AWS) 95.

In the Macintosh version, Dantz claims that the HFS file system can get unstable with about 32000 files. That should not be true with the UNIX file system.

Will Dantz make any changes to eliminate this limitation in future version of Retrospect A/UX?

DISCUSSION ----------

Here is what we received from Dantz:

It is true that Retrospect has a limit per scan of 32,000 files. This matches the limits of the Macintosh file system, though they will address this limit in a future version of Retrospect.

There are a couple of ways to work around this limit on the AWS 95. The best is to use Retrospect A/UX and backup a large drive in segments of 32,000 files or fewer. Retrospect can define folders as "Subvolumes" which act as separate volumes for backup purposes. The entire drive can be backed up this way since each backup session or script may contain an essentially unlimited number of Subvolumes.

Another possibility is to use UNIX utilities such as TAR or DUMP for volumes which exceed 32,000 files or folders.

AudioVision Display: X Displayed Through the Video INIT(3/95)

Revised: 6/27/96
Security: Everyone

AudioVision Display: "X" Displayed Through the Video INIT(3/95)

==========

Article Created: 16 September 1993
Article Reviewed/Updated: 23 January 1995

TOPIC ----------

I'm running the AudioVision Display on a Centris 660/AV. Upon startup my computer loads with an "X" through the video init and when I select the Video Control Panel it indicates that the control panels are not loaded. Additionally, when I select the Sound Control Panel the computer will freeze or give a system error.

DISCUSSION ----------

The AudioVision software provides integrated sound and video capabilities that allow you to take advantage of multi-media and voice technology applications.

This monitor requires a system extension, also known as an "INIT" in the system folder. During the startup process of the Macintosh computers, these extensions display icons at the bottom of the screen as they are loaded.

When an "X" is displayed through the extension icon during this process, the extension has not loaded properly and will not function.

The following procedure should ensure proper loading of the Audio Vision extension.

Note: Your Macintosh system software must be System 7.0.1 or later in order to use the Apple AudioVision software.

The keyboard cable must be plugged into the AudioVision display, and not the back of the computer. When it's not plugged into the monitor, you will still see the X through the INIT startup. The INIT looks to the monitor's ADB port for one of the sense pins on the ADB cable, doesn't see it and 'X's it out.

Install the Software

---

1) Insert the AudioVision Installer disk into the internal floppy disk drive.

2) Click the Installer icon.

3) Make sure that the hard disk indicated in the dialog box is the one on which you want to install AudioVision software.

4) Click the Install button.

5) After finishing the installation, restarting your computer is the only choice you have. When you restart the red X still appears through the video INIT.

6) Shut down your computer AND turn off the monitor for at least 30 seconds before restarting.

7) If you do not perform step 6, upon startup you will continue to see an icon on your monitor with an "X" through it. This icon indicates that the video control panel is not loaded and the AudioVision Display software is not be activated.

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). Macintosh AV Systems: Multiple GeoPort Applications (9/93)

Revised: 12/2/93
Security: Everyone

Macintosh AV Systems: Multiple GeoPort Applications (9/93)

==========

Article Created: 16 September 1993

TOPIC --

Why can't two DSP (Digital Signal Processor) GeoPort applications run concurrently on a Macintosh AV system? If I run, for example, both ApplePhone and the fax software set up to receive faxes, I expect them to work like ARA when it is set to answer calls. ARA will relinquish serial port rights to another application and then reclaim the serial port when the other application releases it.

Is this a function of how those two applications were written, or is a limitation of the ARA software?

DISCUSSION --

The issue: using the GeoPort telecomm adapter, you can run only one telecomm application at a time. Remember that the Express Modem software counts as one application, so you can have multiple applications that use that software running at the same time.

ApplePhone, which is not modem-based, doesn't use the Express Modem software, so you have an either/or situation with it. On the other hand, you could have multiple well-behaved commtoolbox application running at the same time.

You can also have (in some cases, depending on bandwidth use and processor capabilities) multiple DSP applications up and running. Remember that speech recognition takes a LOT of bandwidth and that it is difficult to get other DSP applications running concurrently with it.

At Ease 2.0 for Workgroups: Shift-Key Security Loopholes (8/95)

Revised: 8/14/95
Security: Everyone

At Ease 2.0 for Workgroups: Shift-Key Security Loopholes (8/95)

==========

Article Created: 16 September 1993
Article Revised/Updated: 14 August 1995

TOPIC ----------

We are using At Ease 2.0 for Workgroups. We want a solution that will keep students from saving files and folders anywhere but to a specified folder on the Macintosh server (to cut down on security problems we were having).

At Ease was set up to use the server as the At Ease disk. Everything was working fine until a student held down the Shift key when powering up the Macintosh. At Ease came up with a dialog "The At Ease Preferences file is damaged, please contact your Administrator." The dialog box has a Cancel button in the lower right corner. Clicking on Cancel brings up the Finder with no protection to the local hard disk or the At Ease server that is mounted. This error dialog also comes up if there's any kind of an AppleTalk error, or if the server is under too heavy a load to support the request from the booting At Ease Macintosh.

Reformatting a couple of the drives with the newest HD SC Setup, reinstalling system software and applications, and At Ease, don't fix the problem. This shift key loophole is a big security issue.

If they remove the Finder from the System Folder, can we assume that no one can go to the Finder on those machines, including the administrator or teachers? Is there a utility that would work in this situation (no Finder), that the administrator or teachers could use to move the Finder out of the System Folder and back into it?

DISCUSSION ----------

Users can no longer hold down the shift-key during startup to get into the finder when the At Ease disk is a server. At Ease for Workgroups version 2.0.1 and later have fixed this problem.

Setting MacSNMP trapDestination (4/96)

Revised: 4/20/96
Security: Everyone

Setting MacSNMP trapDestination (4/96)

==========

Article Created: 14 September 1993
Article Reviewed/Updated: 20 April 1996

TOPIC --------------------

I'm trying to specify the console where alarms are sent in MacSNMP, but I'm having a problem. On page 25 of the SNMP Admin Guide, it says to set trapDestination in the trapTable for the System Group of the Macintosh Agent. I can't figure out how to do this. What do I need to do?

DISCUSSION --------------------

We also tried to set trapDestination in the trapTable using the MacSNMP Admin application, but could not do it either. The variable value is not editable from the application. We checked with MacSNMP engineering and they told us you can only set it from a management console.

You need to copy the MIBs from the Administration disk onto the console. You will have to refer to the administration guide that came with your console for the instructions.

Normally from a UNIX workstation you can set trapDestination from the client by specifying the IP address. However, Macintosh is a multiprotocol workstation and we decided that the trapDestination has to be set from the management console.

At Ease 2.0: If You Forget the Administrator Password (8/95)

Revised: 8/14/95
Security: Everyone

At Ease 2.0: If You Forget the Administrator Password (8/95)

==========

Article Created: 20 September 1993
Article Reviewed/Updated: 14 August 1995

TOPIC ----------

This article describes what to do if you are an At Ease 2.0 administrator and you have forgotten the administrator's password.

DISCUSSION ----------

If you forget the administrator password, you can set a new one. However, doing this will turn At Ease off and reset the user greeting to "Welcome to At Ease" (if you had changed it).

To reset the administrator password:

Step 1

Turn off the Macintosh.

Step 2

Insert a disk with system software on it into your floppy drive. If your computer came with a disk called "Disk Tools," use it. If not, use a backup copy you made using Apple Backup.

Step 3

Turn on the Macintosh.

Step 4

Open the System Folder of your usual startup disk (probably on your hard drive). Do not open the System Folder on the floppy disk you are using to start up.

Step 5

Open the At Ease Items folder inside your System Folder.

Step 6

Find the At Ease Preferences file and drag it into the Trash.

Step 7

Hold down the Option key while you choose Empty Trash from the Special menu.

Step 8

Choose Restart from the Special menu, and the floppy disk automatically ejects from the drive.

Step 9

Open the At Ease Setup program.

Step 10

Choose Administrator Password from the Options menu. The Administrator Password screen appears.

Step 11

Type the new administrator password in the upper box. It can be up to 15 characters. Type it again in the middle box to confirm it. (Dots appear in place of letters to keep the password confidential).

Step 12

Type a clue in the lower box to help you remember this password. The clue can be up to 63 characters.

Step 13

Click OK.

At Ease 2.0: Permanently Removing It (8/95)

==========

Article Created: 20 September 1993
Article Reviewed/Updated: 14 August 1995

TOPIC ----------

This article describes how to permanently remove At Ease software from your Macintosh.

DISCUSSION ----------

Turning Off At Ease
==========
If you don't plan to be using At Ease in the near future, but may choose to use it again later, the best option is to simply turn it off. Here's how:

Step 1

Open the At Ease Setup program, and type your password

Step 2

Click the Off button.

If you want At Ease 2.0 completely erased from your system, how you go about it will depend on whether you have the At Ease 2.0 Install 1 disk.

If your Performa came with software already factory-installed, you may not have this disk. In this case, be certain to make a backup copy of At Ease 2.0 (or use Apple Backup to backup your entire hard drive with At Ease on it) before you remove At Ease from your system. Label the backup disks "At Ease 2.0." This way, you have a copy of the software in case you ever want to reinstall it.

NOTE: Never attempt to remove At Ease without turning it off first.

If You Have the At Ease 2.0 Install 1 Disk

Step 1

Open the At Ease Setup Program, and type the administrator password.

Step 2

Click the Off button.

Step 3

Quit the At Ease Setup program.

Step 4

Insert the At Ease 2.0 Install 1 disk into the disk drive.

Step 5

Click the Customize button.

Step 6

Select At Ease.

Step 7

Hold down the Option key. The Install button turns into a Remove button.

Step 8

Click the Remove button. At Ease will be permanently removed from your system. You may reinstall it in the future using the installation disks.

If You Do Not Have the At Ease 2.0 Install 1 Disk

Step 1

Open the At Ease Setup program, and type the administrator password.

Step 2

Click the Off button on the first screen.

Step 3

Quit the At Ease setup program.

Step 4

Drag the At Ease files to the Trash. The files you need to remove are:

- the At Ease Setup program (at the main directory level of your startup hard disk)
- the At Ease Items folder (in your System folder)
- the At Ease file (in your System folder)
- the At Ease Startup extension (in the Extensions folder)

Step 5

Hold down the Option key while you choose Empty Trash from the Special menu.

At Ease 2.0: How To Add & Remove Button Sounds (8/95)

Revised: 8/14/95
Security: Everyone

At Ease 2.0: How To Add & Remove Button Sounds (8/95)

==========

Article Created: 20 September 1993
Article Reviewed/Updated: 14 August 1995

TOPIC ----------

This article describes how to add and remove button sounds in At Ease 2.0.

DISCUSSION ----------

Sound effects can be added to any item that appears in a user's At Ease panels. The sounds will play any time the pointer is moved over a button that has sound attached to it.

NOTE: The sound effect will play even if the text-to-speech feature is turned on. The sound you have recorded will replace the spoken identification of that button.

To attach a sound to a button, you need existing sound files on your hard drive or on a floppy disk. These files are often available as third-party software. If you do not already have sound file, you can also create your own if you have compatible microphone hardware.

Preparing to Attach a Sound
---

1) Open the At Ease Setup Program.

2) Type the administrator password.

3) Choose Attach Sounds from the file menu. The Attach Sounds screen appears, showing you the items to which users have access.

   If the speaker icon next to an item has wavy lines next to it (sound waves emitting from the speaker), that item already has an attached sound.

4) Click the name of the item to which you want to add a sound.

To Import an Existing Sound

Follow the steps above, then:

1) Click the import sound button. The Import Sound screen appears.

2) If necessary, click the pop-up menu above the list of documents and folders on the left side of the screen to locate the sound file you want to use.

3) Click the name of the sound you want attached. You can hear the sound before you import it by clicking the Play Sound button at the bottom of the screen.

4) Click the Import button to attach the sound.

5) Click Done.

To Record an Original Sound

Follow the steps under "Preparing to Attach a Sound," then:

1) Click the Record Sound button. A screen appears allowing you to record a sound.

2) When you are ready to record a sound, click the Record button (marked with a circle).

3) When you are finished recording, click the Stop button (marked with a square).

4) To hear the sound before you attach it to the selected item, click the Play button (marked with a right-pointing arrow).

5) Click Save to save the sound. Wavy lines appear beside the speaker icon associated with the item to which you attached the sound. This indicates that the button will now play the sound you recorded rather than the button name when the pointer passes over it.

Removing a Sound

Follow the steps under "Preparing to Attach a Sound." You will see a screen called "Attach Sounds." Then:

1) Click once on the item from which you want the sound removed.

2) Click Remove Sound.

At Ease 2.0: Restoring Deleted At Ease Software (8/95)

Revised: 8/14/95
Security: Everyone

At Ease 2.0: Restoring Deleted At Ease Software (8/95)

==========

Article Created: 20 September 1993
Article Reviewed/Updated: 14 August 1995

TOPIC ----------

I purchased a Performa with At Ease 2.0 software already installed. I removed it from my system, but now I want to use it again. Will I have to buy the software?

DISCUSSION ----------

If you removed At Ease from your system or deleted any files for At Ease that you want to use again, you have three options:

- If you performed a backup with Apple Backup while the At Ease software was still on your hard drive, you can restore the software using Apple Restore.

- If you did not perform a backup, or if you no longer have a backup copy with At Ease on it, you can call 1-800-SOS-APPL to further discuss your situation.

- If you did not perform a backup, and if you no longer have a backup copy of your hard drive with At Ease on it, you can go to an Apple Authorized Service Provider, who can provide the floppies you need, and may even install the software for you if you bring in your computer. To find the nearest Apple Authorized Service Provider, call 1-800-538-9696.

At Ease 2.0 for Workgroups: Installation (8/95)

Revised: 8/14/95
Security: Everyone

At Ease 2.0 for Workgroups: Installation (8/95)

==========

Article Created: 20 September 1993
Article Reviewed/Updated: 14 August 1995

TOPIC ----------

This article describes how to install At Ease 2.0 for Workgroups, including:

- Using the Install program
- Creating an administrator password
- Setting up for remote administration on an AppleTalk network

DISCUSSION ----------

You will need to install At Ease 2.0 for Workgroups on the startup disk of every computer on the network that will be using it.

(NOTE: The software licensing agreement for your copy of At Ease specifies how many computers may use that copy. Also, before you put other software in shared folders in At Ease, be sure to check whether the software agreement for those programs allows for sharing.)

Before you begin:

- Make sure that file sharing is off on the computers you will be installing At Ease on. To check, look in the File Sharing Setup control panel (in the Control Panels folder under the Apple menu).

- Make sure all virus checkers on the computers are turned off.

- Make sure you have these disks: At Ease 2.0 (WG) Install 1 At Ease 2.0 (WG) Install 2 At Ease 2.0 (WG) Install 3

WARNING: DO NOT install At Ease 2.0 for Workgroups by dragging the files to each hard drive from the floppies. Use the Installer program, which will put files in the correct locations on the startup disks.

Using the Installer

To install At Ease 2.0 for Workgroups on the first Macintosh (the administrator's):

Step 1

Turn on the Macintosh.

Step 2

Insert the At Ease 2.0 (WG) Install 1 disk.

Step 3

Double-click the installer icon.

Step 4

Click OK.

Step 5

Click the Install button and follow the directions on the screen.

Step 6

Click Restart to make At Ease active on that Macintosh.

Administrator Password

Now you will need to create an administrator password so that only you, the administrator, can make changes to the At Ease computers. To do this:

Step 1

Open the At Ease Setup program. You will find it on the startup disk of any Macintosh that has had At Ease installed.

Step 2

Choose Administrator Password from the Options menu.

Step 3

Type the password in the first box, then type it again to confirm it. (You will just see dots instead of letters -- this is to keep the password confidential.) Then, if you choose, type a clue in the large box below.

Step 4

Click OK.

Once you have set up the first Macintosh with At Ease, you will need to prepare the other computers in the workgroup. If the Macintosh systems are not linked by an AppleTalk network, you will have to run the Installer and create the administrator's password on each Macintosh individually at this point.

Setting Up For Remote Administration

If the At Ease computers are linked by an AppleTalk network, the workgroup's administrator can administer the network remotely from a single Macintosh. The administrator can set up At Ease and make changes to it on the administrator's Macintosh, then update every other computer on the network.

To prepare for remote administration, follow these steps for each At Ease computer:

Step 1

Choose Control Panels from the Apple menu.

Step 2

Open the Sharing Setup control panel.

Step 3

Type a name into the space labeled "Macintosh Name," then close the control panel. Make sure each At Ease Macintosh has a distinct name and that everyone knows which name goes with which computer.

Step 4

Go back to the At Ease Setup program by clicking inside the At Ease Setup window.

Step 5

Choose Security from the Options menu.

Step 6

Click the checkbox labeled "Allow remote administration," then click OK.

Step 7

Choose Quit from the File menu to quit the At Ease Setup program.

MacCheck: Test And Help Buttons Grayed Out (6/95)

==========

Article Created: 20 September 1993
Article Reviewed/Updated: 16 June 1995

TOPIC -----

When I double-click on MacCheck, it loads the tests as usual, but the Test and Help buttons are grayed out and not available. I can only click on System Info and Quit.

DISCUSSION -----

This occurs when the application program doesn't reside in the same folder as the data file. Relocate MacCheck to the same folder as the data file, and you'll be able to use the test and help buttons.

Kensington Turbo Mouse: Supersedes Mouse Control Panel 6/94

==========

Article Created: 20 September 1993
Article Reviewed/Updated: 8 Jun 1994

TOPIC ----------

My computer didn't respond to double-clicks. I opened the Mouse control panel, and the Double-click Speed buttons appeared deselected. I selected the buttons, and my computer responded to double-clicks. But when I restarted, the buttons appeared deselected again.

DISCUSSION ----------

Kensington Turbo Mouse software will take precedence at startup over the settings contained in the Apple Mouse control panel. The mouse uses the values allocated in the Turbo Mouse CDEV (v3.0), or the Turbo Mouse Control application program (v4.0), and respond accordingly. As with the Mouse control panel, setting the Turbo Mouse controls to the fastest setting can be inoperable for some users-they just can't click fast enough. The range of values selected for the double click speed in the Turbo Mouse Control Panel was chosen to accommodate the 5th to 95th percentile users. This means that if you select the farthest extreme to the right some users might have a problem generating a double click. Try decreasing the speed in the control panel.

At Ease 2.0 for Workgroups: If a User Forgets a Password (8/95)

Revised: 8/14/95
Security: Everyone

At Ease 2.0 for Workgroups: If a User Forgets a Password (8/95)

==========

Article Created: 21 September 1993
Article Reviewed/Updated: 14 August 1995

TOPIC ----------

We use At Ease 2.0 for Workgroups on an AppleTalk network. One of our users forgot his password. He had changed the password from the one the administrator had assigned to him. How can he regain access to At Ease?

DISCUSSION ----------

The administrator password always works with any user name. To create a new password:

Step 1

Enter the administrator password.

Step 2

Open At Ease Setup.

Step 3

Click Users.

Step 4

Click the name of the user whose password you want to change.

Step 5

Type the new password where the bullets (dots) appear.

At Ease 2.0 for Workgroups: Questions and Answers (8/95)

==========

Article Created: 21 September 1993
Article Reviewed/Updated: 14 August 1995

TOPIC ----------

This article answer several frequently asked questions about At Ease 2.0 for Workgroups.

DISCUSSION ----------

Making Existing Files Available to a User
==========

Question: How do I make existing documents available to a particular user?

Answer: In the Finder, place the items in the user's Documents folder. Here's how:

Step 1

Log on to At Ease as the user to whom you want to make a document available. Use the user's name, but the administrator's password.

Step 2

Go to the Finder (You may need to log on as a user who has access privileges to the Finder.)

Step 3

Open the Documents folder.

Step 4

Find the user's own folder. Inside the Documents folder is an individual Documents folder for each user who has logged on.

Step 5

Move the items into the user's Documents folder.

Can't Open Requested File

Question: The application several members of our workgroup use asks them to open a file that is not on either At Ease panel. It's grayed out in the pop-up menu.

Answer: The administrator set a security feature not allowing users to access documents outside of their own folder. To turn this feature off:

Step 1

Open At Ease Setup.

Step 2

Click Options.

Step 3

Deselect the box next to "Keep users from opening documents anywhere else."

Step 4

Click OK.

Auto Log Out Not Working

Question: I set the computers in our workgroup to log out of At Ease if their Macintoshes had been idle for more than 15 minutes. Now sometimes the Macintoshes stay logged on well past that 15 minute limit. Why?

Answer: If a user has made changes to a document but has not saved them yet, At Ease can't log them out. Save or cancel the changes to the document(s) and At Ease will log that user off.

Items Not Copied From Floppy

Question: I tried to copy some items from a floppy disk to a user's panel. Some of them copied, but others didn't. Why?

Answer: At Ease panels displays only documents or folders that can be opened from At Ease. If the user whose panel you tried to copy to does not have access to the applications that created some of the items on the floppy disk, they will

not copy over to the User's panel.

User's Password Doesn't Work On Other At Ease Computers

Question: A user changed his password, but it only works on the Macintosh he changed it on. Why don't the other Macintoshes recognize it?

Answer: If your workgroup is not on a server, you will have to update each Macintosh in the group separately so they "know" about the new password.

Network Update Does Not Take Effect

Question: The administrator changed the configuration of one of the Setups, then tried to update the other computers. Why didn't the changes show up?

Answer: When you update over the network, each computer will receive the new information. However, At Ease will not reflect the changes on a Macintosh until At Ease is Quit and launched again on that computer.

Apple Font Pack: Making Clock Symbols with the Zeal Font (9/93)

==========

Article Created: 21 September 1993

TOPIC -----

The "Getting Started with Type" booklet that ships with the Apple Font Pack for Macintosh (M4040LL/A) contains incorrect information about which key combinations result in some of the clock symbols available in the Zeal font.

In particular, it says that six o'clock is made by pressing command-shift g. However this combination results in an open book.

DISCUSSION -----

The correct key combination is option-` command-i.

An MS Word document describing the correct key combinations is included on font pack's Install disk. The document is titled "Zeal Symbol Info (MS WORD 5.0)." You don't have to use MS Word to open the document. Most word processors can open it through translation.

Macintosh System Update 2.0.1: Description (10/93)

Revised: 10/1/93
Security: Everyone

Macintosh System Update 2.0.1: Description (10/93)

==========

Article Created: 4 October 1993

TOPIC -----

System Update 2.0.1 contains enhancements to Macintosh System 7.1 and System 7 Pro and a collection of bug fixes. This update requires Macintosh System Software version 7.1 or System 7 Pro.

DISCUSSION -----

Macintosh System Update 2.0.1 incorporates enhancements from the two previous versions of the Hardware System Update, versions 1.0 and 2.0. The primary additional enhancements that Macintosh System Update 2.0.1 provides are:

- Apple HD SC Setup version 7.2.2, which gives you more flexibility to format large Apple hard disks between 1 and 2 gigabytes.
- AutoRemounter 1.2, which significantly reduces network traffic.
- Apple Disk First Aid 7.2, a utility that repairs damaged disks, which provides a new user interface.
- More efficient management of the way fonts use memory.
- Macintosh PowerBook Control Panel version 7.1.3 and Express Modem software version 1.1.2, which include support for communications software that doesn't use the Apple Communications Toolbox.
- System Enabler 131 (version 1.0.3) for the PowerBook 160, 165, 165c, and 180 to support 12-inch monitors and improve reliability.
- Support for System 7.1.1.

The Apple Macintosh System Update will be licensed to customers free of charge through various on-line services, including AppleLink,

America Online, and CompuServe. The System Update 2.0.1 extension will also be included in System 7 Pro, and will be placed directly onto hard drives of shipping CPUs.

MacSNMP: Mac System MIB Compile Error (4/96)

Revised: 4/26/96
Security: Everyone

MacSNMP: Mac System MIB Compile Error (4/96)

==========

Article Created: 21 September 1993
Article Reviewed/Updateed: 26 April 1996

TOPIC --------------------

Next week, together with IBM, I'm going to be demonstrating SNMP at a big exhibition. In trying to configure a RS/6000 as the console we had the following problem:

We couldn't compile the Apple-Macintosh-System-MIB. An error was reported at the line "userInTrouble TRAP-TYPE". I noticed that the MIB's first line states "IMPORTS TRAP-TYPE FROM RFC-1215". This RFC is not available on the RS/6000.

• Is this the problem?

• What is RFC-1215, where is it available, and can we receive a copy?

DISCUSSION --------------------

You have to remove this trap from the MIB definition and it should work fine. The RS/6000 can't handle this trap.

RFC 1215 is a convention for Defining Traps for use with the SNMP, you can find the it on the Internet using a tool such as Gopher.

AWS 95: Long File Names and Retrospect Problem (9/93)

Revised: 9/23/93
Security: Everyone

AWS 95: Long File Names and Retrospect Problem (9/93)

==========

Article Created: 21 September 1993

TOPIC ----------

I backed up my Apple Workgroup Server (AWS) 95, and I had problems backing up files with filenames containing 32 or more characters. I got the error messages from Retrospect, what's wrong?

DISCUSSION ----------

This is a limitation of the Macintosh environment sitting on top of A/UX. The Macintosh limits filenames to 31 characters, so there's no way for Retrospect to deal with this. It's not a Retrospect (or AUX, for that matter) problem, but simply a place where the emulation isn't perfect.

You will find, if you look at that directory in the Finder, that the filenames aren't complete (view with Small Icons, it's easiest to see). If you attempt to move these files via the finder, they are created in the final location with a truncated filename.

This is documented, by the way, in Dantz's manual "Retrospect A/UX backup for the Apple Workgroup Server 95" on page 30 under troubleshooting.

The workaround is to rename these files so that their filenames match the Macintosh naming restrictions (31 characters). This should be a rare case, and the Retrospect log makes it easy to track them down. An alternative would be to back them up exclusively in the UNIX environment with tar, cpio or one of the other backup utilities.

At Ease 2.0 for Workgroups: Installing Over a Network (8/95)

Revised: 8/14/95
Security: Everyone

At Ease 2.0 for Workgroups: Installing Over a Network (8/95)

==========

Article Created: 22 September 1993
Article Reviewed/Updated: 14 August 1995

TOPIC ----------

This article describes how to install At Ease 2.0 for Workgroups over an AppleTalk network.

DISCUSSION ----------

If there are several computers on your network that will be using At Ease 2.0 for Workgroups, it is probably easiest to install the application over the network.

At the Administrator's Macintosh

First, you must install At Ease 2.0 for Workgroups on a server. Working from the administrator's Macintosh:

Step 1

Choose New Folder from the File menu.

Step 2

Name the folder At Ease 2.0 (WG) Net Install.

Step 3

Insert the At Ease 2.0 (WG) Install 1 disk into the floppy disk drive.

Step 4

Drag the At Ease 2.0 (WG) Install 1 disk icon to the At Ease 2.0 (WG) Net Install folder. Eject the disk.

Step 5

Insert the At Ease 2.0 (WG) Install 2 disk. Drag its icon to the Net Install folder. Eject the disk.

Step 6

Insert the At Ease 2.0 (WG) Install 3 disk and drag its icon to the Net Install folder. Eject the disk.

Step 7

Open the At Ease 2.0 (WG) Net Install folder.

Step 8

Open the At Ease 2.0 (WG) Install 1 folder.

Step 9

Select the Installer icon and drag it out of the At Ease 2.0 (WG) Install 1 folder into the At Ease 2.0 (WG) Net Install window.

Step 10

Select the Install At Ease icon and drag it to the At Ease 2.0 (WG) Net Install window.

At Each Workstation
==========

Follow these steps for each computer on the network that will be using At Ease:

Step 1

Turn on the computer.

Step 2

Connect to the file server that has At Ease 2.0 for Workgroups on it.

Step 3

Open the At Ease 2.0 (WG) Net Install folder.

Step 4

Double-click the Installer icon. Click OK in the Welcome dialog box that appears.

Step 5

Click the Install button and follow the directions on the screen.

Step 6

Click Restart to restart the computer and make At Ease available.

System Enablers Collection 1.0: Overview (6/96)

Revised: 6/4/96
Security: Everyone

System Enablers Collection 1.0: Overview (6/96)

==========

Article Created: 22 September 1993
Article Reviewed/Updated: 4 June 1996

TOPIC ----------

In a press release on August 9, 1993, Apple announced the Apple System Enablers Collection 1.0. This article describes the Collection.

DISCUSSION ----------

The System Enablers Collection contains nearly all of Apple's system enabler files on a single disk (the enablers included cover Macintoshes released between October, 1992 and May, 1993) System enablers are system files that allow System 7.1 to operate on Macintosh computers released since October 1992. Macintosh computers introduced before October, 1992 do not need a system enabler to operate. The disk also contains Control Panels and other files specific to these newer Macintoshes. The product contains a simple installer that automatically installs all of the system enablers and control panels in the user's system folder.

BENEFITS
By consolidating all of the different system enabler files into an easy-to-install package, system administrators, who support a variety of Macintosh models, can find the latest system enablers they need in one place. These customers will be able to use the System Enabler Collection to create a system folder that can boot any Macintosh, greatly simplifying network administration.

Some Macintosh users, particularly those with portable hard disks used for presentations or demonstrations, need to maintain a system folder that can boot any Macintosh. The System Enabler Collection will allow these customers to easily install all of the current system enablers into any system folder, so that their portable hard disk will be able to boot any Macintosh.

Service providers and computer rental agencies will also benefit from the System Enablers Collection. These customers will be able easily configure a system folder that can be loaded on any Macintosh computer, allowing them to standardize on one system folder for all their service and rental needs.

SYSTEM REQUIREMENTS AND DETAILS

When installed, the files in the System Enablers Collection take up approximately 550K of hard disk space. This product requires System 7.1. It supports all Macintosh computers released between October, 1992 and May, 1993 (see list in "Details" section). This product does not support Performa computers.

COMPATIBILITY

The System Enablers Collection is compatible with any Macintosh computer running System 7.1 (as of July 1993). Apple is not aware of any applications that have a compatibility problem with the System Enablers Collection 1.0.

AVAILABILITY AND DISTRIBUTION

The System Enablers Collection 1.0 will be made available to bulletin boards and on-line electronic services, including AppleLink. Users can also order the product from Apple's system software fulfillment center by calling the Apple Order Center. When purchased directly from Apple, there is a nominal $10 charge for this product to cover manufacturing, shipping, and processing. Credit card orders only will be taken at the Apple Order Center number.

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center phone number.

System Enablers Collection 1.0: Q & A (9/93)

Revised: 9/22/93
Security: Everyone

System Enablers Collection 1.0: Q & A (9/93)

==========

Article Created: 22 September 1993

TOPIC ----------

This article addresses questions on system enablers and the Enabler Collection.

DISCUSSION ----------

Q: WHAT IS A SYSTEM ENABLER?
A: System enablers are system files that allow System 7.1 to operate on Macintosh computers released since October 1992 (see list in "Extra" section). Macintosh computers introduced before October, 1992 do not need a system enabler to operate. System enablers are located in the computer's System Folder.

Q: HOW DOES THIS SOFTWARE GET INSTALLED?
A: The System Enablers Collection contains an installation program that automatically installs all of the software on the disk in the user's System Folder.

Q: DOES THE DISK CONTAIN ANY FILES BESIDES SYSTEM ENABLERS?
A: Yes. Some of the computers supported by the Collection also have Control Panels and other files that are specific to those computers. These files are also contained in the System Enabler Collection, and are automatically installed along with the system enablers. Examples of these extra files: the Battery Desk Accessory, the PowerBook Control Panel, and the AutoRemounter Control Panel. The Collection also contains the 32-Bit System Enabler, which allows owners of the Macintosh SE/30, II, IIx, and IIcx to address more than 8MB of physical RAM.

Q: WHY DO SOME MACINTOSHES HAVE SYSTEM ENABLERS, BUT OTHER MACS DO NOT?
A: System enablers were introduced in October, 1992 along with System 7.1. System enablers allow Apple to introduce new Macintoshes

without revising the base system software (System 7.1). This has resulted in the most rapid introduction of new Macintoshes in Apple's history. System 7.1 supports Macintoshes released before October, 1992 without the use of a system enabler file. Only one computer released since October, 1992 does not require a system enabler -- the PowerBook 145B.

Q: WILL THIS DISK BE UPDATED IN THE FUTURE?
A: Apple will release updated versions of the System Enablers Collection as needed. The next major release of system software will consolidate all previously released system enablers, which will temporarily eliminate the need for the System Enablers Collection.

Q: IF NEW COMPUTERS COME WITH SYSTEM ENABLERS PREINSTALLED, WHY DO I NEED the System Enablers Collection?
A: Many users, particularly system administrators and service providers, need to create a single System Folder that will boot any Macintosh. Since newer Macs need system enablers to work with System 7.1, these users will need all of the system enabler files in one place if they intend to create a System Folder that will boot any Macintosh. The System Enablers Collection provides all of these enablers in one place, so that users can easily create a System Folder that will boot any Macintosh.

DETAILS
List of Macintosh CPUs that have system enablers on the System Enablers Collection, the name of their system enabler, and the version included in the Collection:

PowerBook Duo 210	System Enabler 201, version 1.0.1
PowerBook Duo 230	System Enabler 201, version 1.0.1
PowerBook 160	System Enabler 111, version 1.0.2
PowerBook 165C	System Enabler 121, version 1.0
PowerBook 180	System Enabler 111, version 1.0.2
Macintosh IIvx	System Enabler 001, version 1.0.1
Macintosh IIvi	System Enabler 001, version 1.0.1
Macintosh Color Classic	System Enabler 401, version 1.0.5
Macintosh LC III	System Enabler 003, version 1.0
Macintosh Quadra 800	System Enabler 040, version 1.0
Macintosh Centris 610	System Enabler 040, version 1.0
Macintosh Centris 650	System Enabler 040, version 1.0

Other files that are contained in the System Enablers Collection:
- Battery Desk Accessory, version 7.1.1
- PowerBook Control Panel, version 7.1.1
- PowerBook Display Control Panel, version 1.0.4
- Sound Control Panel, version 7.1.1
- Screen Control Panel, version 1.0
- AutoRemounter Control Panel, version 1.0
- Memory Control Panel, version 7.1.1
- Caps Lock Extension, version 7.1.2
- 32-Bit System Enabler, version 1.0.3

This product does NOT contain the enablers for the PowerBook 180C and the Macintosh LC 520. These computers were released after the Collection was completed.

At Ease 2.0 for Workgroups: Importing User Names (8/95)

Revised: 8/14/95
Security: Everyone

At Ease 2.0 for Workgroups: Importing User Names (8/95)

==========

Article Created: 22 September 1993
Article Reviewed/Updated: 14 August 1995

TOPIC ----------

This article describes how to import a database file with a list of users into At Ease.

DISCUSSION ----------

You do not have to add users to At Ease individually if their names already exist in a separate database file. For instance, a list of employees or class members could serve as your source of At Ease user names.

Multiple fields that identify the users may make the import and setup process easier. For instance, if the database file you wish to use has employees' first and last names, identification numbers, and departments, you can convert these respectively into Setup fields like user, password, and Setup.

As you import the list of users, you can also tailor the list by grouping the names into particular Setups as you go.

To Import A List Of Users

Step 1

Open the At Ease Setup program on the administrator's Macintosh.

Step 2

Click Users.

Step 3

Click Import to add a list of users to At Ease.

Step 4

Select the name of the file that you want to import.

Step 5

Choose the fields from the original file that you want to import into At Ease.

- At least one name field will become the user name
  (for instance, the last name).
- You may use another available field for the password
  (for instance, a student or employee ID number).
- You may use another field to become the Setup
  (for instance, the employee's department).

Step 6

In the order of the fields in your database, click each label in the available fields list that defines what you want the fields in your database to become in At Ease. Click <Ignore> for any field in the database that you don't want to import. Click Add after each field label selection to make it appear in the Imported Fields list. (Select any item in Imported Fields you decide to remove, and click Remove.)

Step 7

After you have made your choices, click Sample Import to check them.

Step 8

Click OK if the sample is correct.

Step 9

Click OK to import the list.

Step 10

A window will identify how many users and Setups were added. Click OK.

Step 11

Click Done when you are finished importing users. If you have imported a Setup, its name appears in the list of Setups in the main window of At Ease Setup.

KanjiTalk 6.0.7 Upgrade (5/95)

Revised: 5/23/96
Security: Everyone

KanjiTalk 6.0.7 Upgrade (5/95)

==========

Article Created: 22 September 1993
Article Reviewed/Updated: 23 May 1996

TOPIC ----------

KanjiTalk 6.0.7 users have two options to upgrade their Macintosh Japanese Operating Systems.

DISCUSSION ----------

KanjiTalk 6.0.7 users can upgrade to KanjiTalk 7 or Japanese Language Kit 1.2 at special upgrade prices.

KanjiTalk 7

KanjiTalk 7 offers the following features:

- Japanese (fully localized) version of System 7.1
- Japanese Finder
- Seven TrueType fonts: HonMincho, MaruGothic, HeiseiMincho, HeiseiGothic, Osaka, Ryumin, GothicBBB.
- Two PostScript fonts: ChuGothic, SaiMincho

KanjiTalk 7 system requirements:

- At least 5 MB RAM
- At least 28 MB of free hard disk space
- CD ROM Drive (in order to load additional fonts)

Customers who wish to purchase KanjiTalk 7 should contact AsiaSoft Inc. for pricing information. They are at 800-882-8856 as of the date of this article.

Japanese Language Kit 1.2

The Japanese Language Kit offers the following features:

- An extension to System 7.5 (English or other versions) that allows you to input Japanese text and run Japanese applications without switching systems.
- Support for Japanese application menus
- Finder remains English
- Full compatibility with most Japanese software
- Two TrueType fonts: HonMincho and MaruGothic
- Two PostScript fonts: ChuGothic and SaiMincho

Japanese Language Kit system requirements:

- At least 5 MB of RAM
- At least 20 MB of free hard disk space
- An Apple SuperDrive floppy disk drive
- Macintosh System 7.1 or later

Customers who want to purchase the Japanese Language Kit should contact AsiaSoft Inc. for pricing information. They are at 800-882-8856 as of the date of this article.

To verify a vendor's address and phone numbers, use the vendor name as a search string.

HP DeskWriter C: Cause of Garbage Characters (10/93)

Revised: 10/8/93
Security: Everyone

HP DeskWriter C: Cause of Garbage Characters (10/93)

==========

Article Created: 6 October 1993

TOPIC ----------

When I send a print job from a Performa 400 to an HP DeskWriter C, the printer seems to dump garbage characters that have accumulated in the print buffer. This problem occurs only when the printer is plugged in to the printer port, and ceases when the printer is switched to the modem port.

What could be sending this garbage out of the printer port? Is this a problem in 7.0.1P that could be fixed by upgrading to 7.1P2?

DISCUSSION ----------

The problem is most likely the print driver or the AppleTalk driver. Upgrading to 7.1P2 is worth a try if the suggestions below don't help.

HP provided some helpful information on where the "garbage characters" might be coming from:

- HP ships two drivers with the DeskWriter C printer: one for an AppleTalk connection, the other for a direct serial connection. If the HP DeskWriter serial driver is being used and AppleTalk is (or was previously) ON, there is a good possibility that some "AppleTalk data" was sent to the printer buffer and printed as "garbage". One way to clean the print buffer completely is to power cycle the printer.

- In rare instances, spurious data is sent to the printer if the printer is already powered on when the Macintosh is turned on. Try starting up the Macintosh on first, then powering on the DeskWriter.

- Be sure the serial cable you're using is an HP cable #92215S or Apple cable #M0197 for a direct serial connection.

LW 8.0: Fixed Margins in Page Setup (9/93)

Revised: 9/23/93
Security: Everyone

LW 8.0: Fixed Margins in Page Setup (9/93)

==========

Article Created: 23 September 1993

TOPIC ----------

I have some questions regarding the LaserWriter 8.0 driver.

1) Why is the right margin in LaserWriter 8.0 Page setup window set at .403 and the other margins are set at .431 on an 8.5 by 11 inch page?

2) Why are the margins in all different (top .111, left .139, bottom .208, right .153) sizes if Larger Print Area is selected on an 8.5 by 11 inch page?

DISCUSSION ----------

1) The fixed margins displayed in the LaserWriter 8.0 Page Setup dialog are "standards" created by the Apple Imaging hardware group and these same standards apply to all LaserWriters since the LaserWriter IINT, with a few exceptions. All of the margins are based on what the maximum imageable areas are for the various print engines. When a different PPD (PostScript Printer Description) is selected for a different printer, these values may change to reflect the imageable area for that print engine.

2) In terms of your question with "Larger Print Area", the margins displayed are in fact the minimum margins that create a boundary for the maximum imageable (or printable) area. NOTE: Even though Larger Print Area is selected, the maximum printable area may not be achieved unless an application specifically supports those minimum margins.

At Ease 2.0 (WG): Updating On An AppleTalk Network (8/95)

Revised: 8/14/95
Security: Everyone

At Ease 2.0 (WG): Updating On An AppleTalk Network (8/95)

==========

Article Created: 23 September 1993
Article Reviewed/Updated: 14 August 1995

TOPIC ----------

This article describes how to put the information on the administrator's Macintosh onto all of the At Ease computers on an AppleTalk Network.

DISCUSSION ----------

Making a List of Computers to Update

The first step to updating the At Ease workgroup is to make a list of the computers in the group you want to update with the information on the administrator's Macintosh. To do this:

Step 1

Open the At Ease Setup program on the administrator's computer (where you have created the group's Setups).

Step 2

Choose update Computers from the Options menu.

Step 3

To create the list of computers to be updated, click the Add button. You will see a dialog box with a window called "At Ease Computers" and another called "Computers to Update". If one of the names of the At Ease computers is dimmed, it has been set not to allow remote administration. If you want to update that computer, you will have to turn on the remote administration option in its At Ease Setup program.

Step 4

Click the names of the computers that you want to update with the At Ease information on the administrator's computer. If you have never remotely updated computers before, try updating one computer first, then check that computer to be sure the update process was successful and the settings are as you want them. If they are not, change the settings on the administrator's computer and try updating again.

Step 5

Click Add. If you are asked for the password, type in the administrator's password.

Step 6

Click OK when you are done. A list of the computers you selected for updating will appear.

Checking the At Ease Computers

At this point you can check each selected computer's setup. Top do this:

Step 1

Click the name of the computer you want to check.

Step 2

Click Check.

If you are attempting to update a computer with documents or applications to which that computer does not have access, it will list the missing items. You will have to add those documents or applications to the computer before it can be updated.

Step 3

Click OK.

Updating the Computers

Now you can finish updating by clicking Update All. If you get a message saying a computer is unavailable (it may be turned off, or not running At Ease), you can continue the update and update the unavailable computer later. If you click Cancel at this point, then make the unavailable computer available, you will have to start the update process over again from the beginning.

Click Done when you are finished.

You will need to restart all the computers that have been updated and have them

start up with At Ease:

Step 1

Check the main window of the At Ease Setup program to make sure that At Ease is turned on.

Step 2

Choose Quit from the File menu.

Step 3

Choose Restart from the Special menu.

Article Change History:
14 Aug 1995 - Corrected minor typo.
08 Aug 1995 - Added keyword and reviewed for technical accuracy.

A/UX and gcc Binary (9/93)

Revised: 9/24/93
Security: Everyone

A/UX and gcc Binary (9/93)

==========

Article Created: 23 September 1993

TOPIC ----------

I would like to get the A/UX gcc binary. Do you have one for A/UX 3.0? Could you tell me where I can get it?

DISCUSSION ----------

The latest version of gcc for A/UX 3.0 and 3.0.1 is 2.4.5. It is available from anonymous ftp on jagubox.gsfc.nasa.gov (128.183.44.1) under the /pub/aux directory.

You might also need to get a copy of gzip package (also in jagubox) to uncompress files since it is in gz (gnu compressed) format.

Portable StyleWriter: How the Two Power Sources Interact (9/93)

Revised: 9/24/93
Security: Everyone

Portable StyleWriter: How the Two Power Sources Interact (9/93)

==========

Article Created: 16 September 1993

TOPIC ----------

What is the value of the DC current necessary to run the Portable Stylewriter?

DISCUSSION ----------

The AC adapter supplies +9.5VDC to the printer. The Nickel-cadmium battery Pack supplies 6VDC.

Here is a brief explanation of how the two power sources interact:
When the DC plug of the AC adapter is plugged into the printer, the unit will switch from the Ni-Cad battery to the AC adapter. The DC input, after passing through a 0.4A fuse and a noise filter, is checked for voltage by the A/D converter to judge whether the input is from the 9.5VDC or 6VDC Ni-Cad. If the Ni-Cad only is being used, the 'low battery sensing function' and 'auto power off' functions are activited. When the Ni-Cad pack is being charged, the A/D converter is used to check that DC is being inputted from the AC adapter and to activate the 'auto charge off function'.

AppleSearch Searching Tips (9/93)

Revised: 9/24/93
Security: Everyone

AppleSearch Searching Tips (9/93)

==========

Article Created: 20 September 1993

TOPIC ----------

This article presents Boolean operators that help you refine search requests in AppleSearch. The name Boolean is a mathematical term, used here to describe document-searching and sorting logic. Boolean queries use special qualifying words, called Boolean operators, to expand or narrow the scope of your search. AppleSearch supports the full range of Boolean operators: or, and, not, wild characters, and proximity connectors. This article summarizes them.

DISCUSSION ----------

Please note that a search request is evaluated from left to right. Here's a list of operators you can use in AppleSearch:

- The and operator
  This searches for articles that contain both search words separated by the operator "and".

- The or operator
  This searches for articles that contain either one or combinations of the search words. The "or" operator is the default operator between search words.

- The not operator
  This searches for articles that contain the search words preceding, "not". It ignores articles containing the search words following "not".

- The "*" (wild string) operator
  Wild string searching allows you to generate other possible search words by substituting the "*" with 0 or more text characters in order to form new words. You can insert the "*" anywhere in the search word to find articles that contain variations of the word with the

"*". Example: Searching on Victor* will find words such as victor, victorian, victoria and victory.

- The "?" character
  Use the question mark to search for words that can be formed by substituting the question mark (?) with a letter. Example: Poe?s finds poets or poems.

- Proximity (or adjacency) operators
  Proximity searching allows you to find important search terms when they are next to each other. You can use any of these operators: (-), (.), (,), ('), (adj). The "adj" operator requires spaces between the words.

  For example, the search string:

    AppleTalk adj Remote adj Access

  will give you all occurrences of AppleTalk Remote Access and won't return articles that contain only "appletalk" or "remote" or "access".

  You can further adjust the proximity of the search by specifying how close the search terms need to be to each other. To adjust the proximity of your search, use the W/n Boolean operator, where W means within and n equals the number of terms that exist between your search words. For example, the search string:

    Apple w/3 router

  finds a good selection of AppleTalk Internet Router articles.

- The "!" (word expansion) operator
  Word expansion allows you to search for words that frequently occur with your search word. By inserting the exclamation mark (!) after your search word, you instruct AppleSearch to find articles that contain the words that occur most often with the search word (the word preceding the exclamation mark). For example, the search:

    SCSI!

  will find articles containing words like device, SC, Small Computer Systems Interface, and so on.

- The () operator
  Enclosing a phrase in parentheses instructs AppleSearch to process the enclosed search words before evaluating those outside parentheses. It designates the precedence of searching as the phrase is evaluated from left to right.

SNA•ps APPC and APPC/PC Under DOS (9/93)

Revised: 9/28/93
Security: Everyone

SNA•ps APPC and APPC/PC Under DOS (9/93)

==========

Article Created: 27 September 1993

TOPIC ----------

Can SNA•ps APPC connect to a PS/2 running APPC/PC under DOS? My environment has a PS/2 running APPC/PC (V 1.11, 1986) under DOS 3.3 connecting to an IBM 9370 mainframe running VTAM as a Host type 5 or SSCP node.

DISCUSSION ----------

In your environment, you were not able to connect the APPC/PCs to the 9370 using PU 2.1 peer-to-peer communications. You were also not able to get SNA•ps APPC gateways to attach to the PS/2 running APPC/PC using peer or PU 2.1 connections. From the trace provided, the APPC/PC is rejecting the SNA•ps peer PU 2.1 XID response. We had to conclude the APPC/PC (DOS version) was not able to interact with a full implementation of PU 2.1 found with the SNA•ps APPC product. The APPC/PC product is too old in the evolution of SNA to work at the peer level with SNA•ps.

Here is the exact technical explanation, SNA•ps receives a '2203000000' on the XID pre-negotiation phase. This is the very last thing in their response to our XID. By looking up the control vector (Chapter 8 of SNA Formats) we find that this is a 'XID Negotiation Error' and that the '0000 00' are the byte and bit offset of the offending data. In other words, they rejected the first bit of the first byte of data that we sent them.

In checking with IBM, we found that IBM no longer supports APPC/PC, and they recommend moving to OS/2 or NS/DOS. SNA•ps has been tested with both OS/2 and NS/DOS and works perfectly in PU 2.1 peer-to peer connections.

Apple Fax Document Index (8/96)

Revised: 2/17/97
Security: Everyone

Apple Fax Document Index (8/96)

==========

The following is the Apple Fax technical support fax document index as of 8/16/96.

This index contains the document numbers, titles and short abstracts of the technical support documents available on the Apple Fax system.

Each of the documents has a corresponding Technical Information Library article.

To order one of the following documents by fax;

1) Review the Apple Fax Document Index for the available product literature. (This article)

2) Make note of the 5 digit literature number to the left of each document.

3) Call Apple Fax at 1-800-505-0171

When you make the connection;

4) Press 1 on your touch tone phone to order a document.

5) You will be prompted to enter the document number(s) you are requesting.

PowerCD: How to Connect to a Macintosh (9/93)

==========

Article Created: 27 September 1993

TOPIC ----------

How do I connect my PowerCD to a Macintosh computer?

DISCUSSION ----------

To connect your PowerCD to a Macintosh computer, you must use the appropriate SCSI cable and set the SCSI ID number. In order to be recognized as a SCSI device on your Macintosh, the PowerCD needs to be powered on before the Macintosh is booted.

SCSI Cabling

If a PowerCD is the only SCSI device you're connecting to a Macintosh, connect a SCSI System cable between the SCSI ports of the Macintosh and the PowerCD. If you're connecting to a PowerBook, use a HDI-30 SCSI System cable instead. The PowerCD has active internal termination, so an external SCSI terminator isn't necessary.

If you're connecting to a Macintosh along with other SCSI devices, connect a SCSI Peripheral cable between the SCSI ports of the PowerCD and the last device on the SCSI chain. Be sure to plug a SCSI terminator between the end of the SCSI cable and the PowerCD.

If you're connecting to a PowerBook along with other SCSI devices, connect a SCSI Peripheral cable between the SCSI ports of the PowerCD and the last device on the SCSI chain. Plug a SCSI terminator in two places:

1) Between the end of the SCSI cable and the PowerCD

2) Between the end of the SCSI System cable and the first SCSI device in the chain

Note that the PowerCD must be the last device on the SCSI chain. Apple

recommends using Apple SCSI cables to ensure trouble-free results.

SCSI ID Number

You may set the SCSI ID number, which is on the back of the PowerCD next to the SCSI port, to any unused number between 1 and 6. The SCSI ID number of your PowerCD is factory set to 3.

The PowerCD can be used on a SCSI chain with other Apple CD-ROMs and with the AppleCD 300 driver loaded, but its SCSI ID number must be lower than any other CD-ROM device in the chain. If you connect a PowerCD to a Macintosh with an Apple Internal CD-ROM 300 drive, you will probably have to change the PowerCD's SCSI ID number, since the Apple Internal CD-ROM 300 is usually set to SCSI ID=3. Note that the PowerCD Audio (or CD Remote) will only play audio tracks on the device that has the lowest SCSI ID number.

System 7.1 Software: Installing from 800K Disks (9/93)

Revised: 9/27/93
Security: Everyone

System 7.1 Software: Installing from 800K Disks (9/93)

==========

Article Created: 27 September 1993

TOPIC ----------

System 7.1 Update Kits purchased from software resellers contain 800K media. Those purchased directly from Apple are on 1.44MB disks. The System 7.1 installation process for 800K media differs slightly from 1.44MB disks. This article discusses the differences.

DISCUSSION ----------

With 1.44MB disks, you are instructed to shut down the computer, boot from the first floppy Install disk, and follow the installation program from there.

The installation using 800K media is slightly different. You're instructed to insert the first floppy Install disk while the Macintosh is running, and follow the installation program from there.

There are no problems using 800K media in high density floppy disk drives. The key difference is that you can't start up the Macintosh with System 7.1 on 800K disks. The 800K Install disk doesn't have room for the system files required to start up a Macintosh.

The documentation in the System 7.1 Upgrade Kit is correct for 800K media. The manual instructs users to insert the Install disk and proceed from there. You shouldn't shut down the computer, and try to boot from the disk.

Complete instructions for a Clean Install of System 7.1 are available in a separate article in the Tech Info Library or from the FaxInfo System.

Apple IIgs OS v 6.0: Aristotle Installation (2/95)

Revised: 6/5/96
Security: Everyone

Apple IIgs OS v 6.0: Aristotle Installation (2/95)

==========

Article Created: 27 September 1993
Article Reviewed/Updated: 16 February 1995

TOPIC ----------

This document provides installation steps to install Aristotle on an Apple IIgs using GS/OS v 6.0

DISCUSSION ----------

Hardware Requirements

You will need the following hardware:

- A Macintosh Plus, SE, or member of the Classic, LC, Macintosh II, Centris or Quadra families of Macintosh computers operating in System 7 with a minimum of 4 Megabytes of random access memory (RAM) installed for Apple IIe networks.

- A Macintosh computer with 5 MB of RAM installed is recommended for Macintosh and Apple IIgs networks.

Installation
---

1) Preparing the hard drive.

   Insert the Disk Tools disk from the system software package in the accessory kit, and turn the Macintosh on. Open the program "Apple HD SC Setup" and click "Initialize." Answer any dialogues that ask if you want to erase the hard drive. Once the hard drive has been successfully initialized, click "Quit." When you see the Macintosh desktop, choose "Restart" from the "Special" menu.

2) Installing System 7

Insert the Install disk, or the InstallMeFirst disk from the system software package in the accessory kit. Follow any prompts. Be sure to click "Customize" to install any necessary network card services (Ethernet, Router, and so on).

3) Installing AppleShare 3

a) With the Macintosh turned on, insert the File Server Disk and double-click on the Installer.

i) Click "Customize"

ii) Select File Server software, and Apple II Startup.

b) Check Computer's clock and set time in the "General Controls" control panel

c) Check Network Connections

i) Choose "Chooser" from the Apple menu and make sure AppleTalk is active

ii) Choose "Control Panels" from the Apple Menu and open the Network control panel to verify correct services (Ethernet, or LocalTalk) are selected.

4) Setting Up File Service

a) Open the System Folder (not the folder titled "system") and locate the AppleShare Admin application. Select its icon by clicking on it once and choose "Make Alias" from the "File" menu. Put the alias in the Apple Menu Items folder.

b) Open the AppleShare Admin Application

c) Name the File Server (enter Admin. key and click OK)

i) This is the name users will see in the Chooser

ii) Admin. Key is a password you enter whenever entering the Admin. Application. Password can be up to 8 characters long.

d) Enter an Administrator's name and Password

i) Enter any name -- Default is "Administrator"

ii) Up to 8 characters for password -- For Administrator's personal account on the server.

e) Check options needed as server Administrator

i) You will probably assign yourself all available options. Be sure to click "save."

5) Creating Groups

For Aristotle, there must be a group named EXACTLY "Student" and one named EXACTLY "Teacher" not "STUDENTS" and not "TEACHERS."

6) Creating Users

Assign each user to Student or Teacher as a primary group.

Only user's who's primary group is Teacher or student can log onto Aristotle

7) Allowing Guest Access

Double Click on the <any user? option in User List

Default is turned off. Click Login Enabled.

8) Enable Apple II Startup

Select "Enable Apple II Startup" from the Server Preferences in Server menu of the Admin. Program.

This will create a folder named "Users" on the root level of the server volume.

9) Selecting Volumes to Share

a) In the Administrator Application, choose "Access info" from the "Privileges" menu.

b) Select the item to be shared and click "share." The item will appeared in the shared items box on the right side of the dialog box.

c) Set privileges for the administrator. Mark check boxes: See folders, See files, Make changes.

d) Set everyone in users and groups to 'See folders'

e) Click the save button, a dialog box will appear. Select explicit.

Note: If you are going to provide Apple II Network Startup, the entire startup hard disk must be shared.

10) Open the AppleShare Server Application

11) Creating AppleShare Workstation Disk for the IIgs on 3.5 disk.

a) Start up with the Apple IIgs GSOS 6.0 System Disk

b) Insert a blank 800 K disk in the second 3.5-inch drive

c) Format the blank disk and name it "Workstation"

d) Remove the blank disk and insert GSOS v 6.0 Install Disk.

e) Open the Installer program on the Install Disk.

f) Click "Customize" when the Installer program appears.

g) Eject the Install disk and insert the Workstation disk.

h) Click "Disk" until you see "Workstation"

i) Select "Network: AppleShare 3.5 Disk" and click "install."

j) Swap disks until the installation is complete

k) Set the Apple IIgs control panel (CMD-CTR-ESC).

Note: It is recommend that you use two 3.5-inch drives.

Note: 01 and 03 ROM revision Setups.

```
 IIgs ROM 01 - Slot 1=your card
               Slot 7=AppleTalk

 IIgs ROM 03 - Slot 1=AppleTalk
               Slot 7=AppleTalk
```

12) Restart the IIgs with the Workstation disk. (CTR-Reset, at prompt type PR#5).

13) Connecting to the server from the IIgs

a) When Launcher window appears, click "Cancel"

b) Choose "Control Panel" from the Apple Menu

c) Select the AppleShare Icon on the left and the name of the server on the right.

d) Click "OK"

e) Type in the name and password of the Administrator and click "OK"

f) Select the name of the volume that will be used for the Apple II software.

g) Click "OK" and close the Control Panel.

14) Installing GSOS system software

a) Choose "Launch" from the "File" menu.

b) When the Launcher window appears, insert the Install disk.

c) Click "Disk" until Install is the Active disk.

d) Select Installer and click "Open."

e) Click "Customize" when the Installer program appears.

f) Click "Disk" until the name of the Server volume appears.

g) Choose the "Network: Server Startup" and "Network: Server Quick Logoff". (Open Apple to select multiple items.)

h) Click "Install" and "Perform this Update"

15) Restarting the IIgs from the network.

a) Open the AppleShare Admin. program from the Macintosh File Server

b) Select a user from the User list(click one time, do not open)

c) Choose "Set startup info" from the "Startup" menu

d) Click "Set Startup App"

e) Click "Desktop" then double-click the name of hard drive and the open the System folder.

f) Select the file called "Setstart.Sys16"

g) Close the Set Startup window and click "OK"

h) Choose "Verify" from the "Startup" menu.

i) Click "OK"

j) Go to the IIgs and change hardware control panel(CMD-CTR-ESC) set the RAM DISK to a minimum of 256k.

k) Restart the IIgs.

l) Log in as Administrator.

** Note: Repeat steps b-i for every user who will log in from an Apple IIgs.

16) Installing Aristotle

a) Insert the Aristotle Menu Software disk in the IIgs floppy drive.

b) Drag the Aristotle folder to the server volume icon on the desktop.

This will put the folder on the root level of the hard disk. This is recommended to minimize problems with access Privileges of enclosing folder.

c) Eject the Aristotle Menu Software Disk.

d) Insert the GSOS Install Disk.

e) Open the Installer Program.

f) Click "Customize" from the Installer program window.

g) Click "Disk" until the name of the server volume appears.

h) Choose the Aristotle Update script on the Left.

i) Open the Aristotle folder on the server volume.

j) Open the Menu.D. folder within that Aristotle folder.

k) Click "Install" and quit the Installer.

17) Setting Privileges on the File Server

a) For the folder named "System", NOT the Macintosh System folder.

Verify that Owner, Group and Everyone can See Folder and See Files on the Folder named System. Click "Save"

b) For the "Users" Folder, verify Owner and Group and Everyone can See Folders. DO NOT change all enclosed folders. Click "Save"

c) The "users" folder's group should be Teacher

d) For the Aristotle folder, verify that Owner, Group, and Everyone can See Folders and See Files. Owner and Group should be able make changes.

e) The Aristotle folder's group should be Teacher. Change all enclosed folders. Click "Save"

18) Setting up the Startup application for each user

a) A Student User should be set to Menu.D as Startup

b) A Teacher User should be set to Menu.M as startup.

c) Verify each group from the Startup Menu and select Verify startup.

Adding New Users

After installing Aristotle, new users that have been added to the Users and

Groups datafile will not appear in the User Menu of the Aristotle Menu Management Program.

They will appear after performing these steps:

1) Select the name of user.

2) Select "Verify Apple II startup Information" from the "Startup" menu in the Administrator Program.

3) With Verification complete, open the Users Window in Aristotle (If already open, close and open again.).

If these three steps do not work, check privileges and make sure the user has Teacher or Student assigned as a primary Group.

AppleShare 3.0 Commonly Asked Questions (9/94)

Revised: 9/29/94
Security: Everyone

AppleShare 3.0 Commonly Asked Questions (9/94)

==========

Article Created: 27 September 1993
Article Reviewed/Updated: 29 September 1994

TOPIC ----------

This article presents commonly asked customer questions about AppleShare 3.0, and the answers.

DISCUSSION ----------

Q) Some of the user names are "grayed out" in the User List. What's wrong?
A) The login for those users is disabled. The Administrator, within the Admin application, must enable each user's login.

Q) How do I remotely administer my AppleShare server?
A) Apple doesn't provide a way to administer AppleShare 3.0 remotely. You must do administration tasks at the server or remotely via a third-party product.

Q) The users on the network can't see the server. What's wrong?
A) Ensure that you've done the following:

- Launched the File Server
- Shared the volumes
- Given users appropriate access

Q) Should I install the workstation software for AppleShare 3.0.1 on my workstations?
A) You should install the AppleShare 3.0.1 workstation software, unless the workstations are running System 7.1. This version has many new features.

Q) What can I do to maximize the performance of AppleShare 3.0?

A) Check the following:

- Make sure that AppleShare is the only application running on the server.
- Set the Remote User Activity Meter to 100%.
- Set the RAM cache between 1024K and 2048K.
- Eliminate any third-party extensions.

Increasing the memory partition for the AppleShare File Server application won't affect performance.

This article is one of many available through the Apple Fax center. Macintosh PC Exchange: Troubleshooting Overview (7/96)

Revised: 7/1/96
Security: Everyone

Macintosh PC Exchange: Troubleshooting Overview (7/96)

==========

Article Created: 17 November 1993
Article Reviewed/Updated: 01 July 1996

TOPIC ----------

Macintosh PC Exchange is a control panel that lets you format, read, or write DOS-format floppy disks in a Macintosh computer.

Formatting a disk prepares the disk to receive data. PC and Macintosh computers format disks differently. The term "DOS" describes disks formatted using DOS, Windows, or OS/2. Macintosh PC Exchange doesn't provide data translation.

DISCUSSION ----------

REQUIREMENTS
============

Be sure you have the proper software and hardware to use Macintosh PC Exchange:

- System software version 7.0 or later
- An Apple SuperDrive (formerly called FDHD), or equivalent third-party drive that reads DOS high-density disks
- At least 3 MB of random access memory (RAM)

WORKING WITH DOS DISKS
======================

After you install Macintosh PC Exchange in your Control Panels folder and restart your computer, DOS-format disks appear directly on your Macintosh desktop when you insert them into the floppy disk drive.

Formatting Disks

Formatting erases all data on a disk. Be sure the disk you want to format

doesn’t contain information you need. Click on the disk icon once to select it, and then choose Erase Disk from the Special menu. A format pop-up menu includes these options:

- Standard Macintosh format

  Formats high-density disks at 1440K, and low-density disks at 800K.

- PC-DOS format

  Formats high-density disks at 1440K, and low-density disks at 720K.

- Apple II ProDOS disks

  Formats 400K, 800K, or 1.4MB 3.5 inch Apple II ProDOS disks.

Unreadable Disks

When you insert a floppy disk into a Macintosh, you may see a message saying the disk isn’t readable, and asking whether to initialize it. This might happen for the following reasons:

- In the past, many DOS users formatted low-density disks for use as high-density disks. On a DOS computer, always format standard double-sided disks in the 720K capacity, and high-density disks in the 1440K capacity. The Macintosh doesn’t recognize an improperly formatted disk.

- An unreadable disk might be damaged. Don’t try to repair a DOS-format disk with a Macintosh repair utility program. This may destroy information on the disk. If the disk requires repair, use a disk repair utility on a DOS computer.

- If a disk has never been used, you just need to initialize it.

- If you don’t see more than one disk format choice, your computer needs an Apple SuperDrive. You can’t use Macintosh PC Exchange in a Macintosh SE or a Macintosh II computer without a SuperDrive upgrade. You can’t use Macintosh PC Exchange on a Macintosh Plus computer.

- Macintosh PC Exchange might not be properly installed. The PC Exchange icon must be in the Control Panels folder, and you must restart the computer after installation. Read the installation instructions in the Macintosh PC Exchange User’s Guide.

Extension (INIT) Conflicts

The Macintosh loads system extensions, often called INITs, into system memory when the computer starts up. When they aren’t compatible with other software on your computer, you have an INIT conflict. Here are some typical symptoms of INIT conflicts:

- System won’t accept a correctly formatted DOS disk.

- System freezes when you insert a correctly formatted DOS disk.

- You can’t open the Macintosh PC Exchange control panel to make changes.

If you suspect an INIT conflict, call the Apple Fax Info System at 1-800-505-0171 and order fax document number 20242 for instructions.

WORKING WITH DOS DOCUMENTS

DOS Documents Won't Open

Sometimes you might double-click a document’s icon, and see a message saying that the application program couldn’t be found. An MS-DOS or Windows document may not open when you double-click the icon for the following reasons:

- The Macintosh doesn't know which application program to launch. You can follow the steps in the "Opening a Document from within a Program" section. You can also follow the instructions under "Assigning Document Type."

- You may be trying to access the document over a network. PC Exchange assignments don’t work for documents over a network. Assignments work only for documents on DOS-format floppy disks and documents copied from DOS-format floppy disks.

- The disks currently available on your computer don't have the application. Find the disk that contains the application, and copy the application to your hard disk.

Sometimes the application program launches, but the document doesn't open. Here are some reasons this may happen:

- The application program may not be able to open DOS documents when you double-click the icon. Follow the instructions in the "Opening a Document from within a Program" section.

- The document may have been assigned a document type that the program can't open. Follow the instructions in the "Assigning Document Type" section to change the document type. Refer to the table in the "Assigning Macintosh Programs to DOS Documents" section of the "Macintosh PC Exchange User's Guide" to find types that a program can open.

Incorrect Document Format

Sometimes you can open a document, but find the format is wrong. It may contain incorrect characters and strange codes. This can happen when an application program recognizes the document’s type, but doesn’t interpret the document’s file format (the way the information in the document is encoded).

Check the application’s documentation for document opening and saving procedures

with different file formats, or open the document with another program.

You can also try assigning a different document type. Follow the instructions"Assigning Document Type" section of this article. Refer to "the table in the "Assigning Macintosh Programs to DOS Documents" section of the Macintosh PC Exchange User’s Guide" to find types that a program can open.

Opening a Document from within a Program

To open a document using an application program, follow these steps:

1) Launch a Macintosh application.

2) Choose the Open command from the File menu.

3) In the dialog scroll box, select the DOS document and click Open.

Here's why the document you want may not be listed in the directory dialog box when you choose Open in an application program:

- The program can't recognize the document type assigned to the document. Try to open the document with another application program. Or reassign a document type following the instructions in the "Assigning Document Type" section to change the document type. Refer to the table in the "Assigning Macintosh Programs to DOS Documents" section of the "Macintosh PC Exchange User's Guide" to find types that a program can open.

- You may be trying to access the document over a network. PC Exchange assignments don't work for documents over a network. Assignments work only for documents on DOS-format floppy disks and documents copied from DOS-format floppy disks.

Assigning Document Type

The Macintosh PC Exchange control panel lets you map file types. A three-letter DOS suffix maps to a corresponding document type on the Macintosh. Here's how to designate a specific Macintosh application for opening MS-DOS documents:

1) Choose Control Panels from the Apple menu.

2) Double-click the PC Exchange control panel to open it.

3) Click on Add.

4) In the DOS Suffix box, type a period and the three-letter DOS suffix (for example, .TXT). The suffix is required. There is an error in the manual which states that a suffix is NOT required. This is incorrect.

5) In the lower part of the dialog box, select the Macintosh application.

6) Choose a document type from the Document Type pop-up menu (for

example, TEXT).

7) Click OK.

Once you make this assignment, you can double-click the icon of the DOS document to open it.

When assigning document types, you must specify the type of document the application supports. If you're unsure of which document type to use, TEXT is the safest.

Once you've made assignments, documents appear on the disk with the icon representing application and document type. Documents with an unassigned DOS suffix appear as generic DOS documents.

So that all network users are consistent, make a master list of assignments on one Macintosh. Also, place a copy of the PC Exchange Preferences file in the Preferences folder, within the System Folder, of each licensed user's Macintosh.

WORKING WITH MACINTOSH DOCUMENTS

Document Types

Choose Save from the File menu to save documents onto a DOS-format disk. When saving documents created or modified on the Macintosh, be sure to save the document in a file format that the DOS application can read. Refer to the application's documentation to find out what file formats the program can open, import, and save.

The Macintosh also creates two new files for each document, to keep track of such things as the location of icons and windows. You'll need to leave about 5K of extra disk space for each document to accommodate these files.

Document Name Length

While the Macintosh supports document names up to 31 characters long, DOS supports up to eight characters plus a three-character suffix. Macintosh PC Exchange truncates a longer name used on the Macintosh when saved to a DOS disk. To preview what the shorter name looks like:

1) Click on the file to highlight it.

2) Choose Get Info from the File menu.

3) Click on the document name in the Info dialog box. This switches between the Macintosh and DOS (truncated) version of the name.

If this procedure doesn't work, make sure the File Sharing Extension is in the Extensions folder.

Non-English Word Processors

When you create a document with a non-English word processor on the Macintosh, the special accent characters (diacritical marks) may change when you open the document on a DOS computer. DOS computers may not support all characters displayed on a Macintosh.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). Quadra 660AV and 840AV: Frequently Asked Questions (7/96)

Revised: 7/1/96
Security: Everyone

Quadra 660AV and 840AV: Frequently Asked Questions (7/96)

==========

Article Created: 27 September 1993
Article Reviewed/Updated: 01 July 1996

TOPIC ----------

This article contains answers to frequently asked questions (FAQ) about the Macintosh Centris/Quadra 660AV and Quadra 840AV.

DISCUSSION ----------

Quadra 840AV Q&A

Question: How is the DRAM/VRAM configured? Is it the same as the Quadra 800?

Answer: The 8MB configuration comes with one 8MB SIMM. The 16MB configuration comes with two 8MB SIMMs. The VRAM is the same as the Quadra 800. It takes four 256K SIMMs to achieve the maximum 2MB of VRAM. There is no DRAM on the logic board.

Question: Is the Quadra 840AV upgradeable to Power Macintosh?

Answer: The Quadra 840AV is upgradeable to the Power Macintosh 8500/120. This upgrade will not be available until 2 months after the introduction date of the Power Macintosh 8500 series computers.

Question: Can I upgrade the Quadra 900/950 to a Quadra 840AV?

Answer: No, there is currently no upgrade path for these machines to the Quadra AV technology.

Centris/Quadra 660AV Q&A

Question: Is the Centris/Quadra 610 upgradeable to the 660AV?

Answer: These logic board upgrades have been discontinued.

Question: Does the Quadra 660AV have an FPU built-in?

Answer: Yes, it's a 68RC040 processor running at 25MHZ.

Question: What are the DRAM/VRAM configurations on the Quadra 660AV? Is it the same as the Centris/Quadra 610?

Answer: Yes, Except the 660AV requires 70ns RAM. It has 4MB of RAM on the Logic Board, and two slots for expansion. The 8MB configuration comes with one 4MB SIMM. The Macintosh Quadra 660AV has 1 MB of VRAM.

Question: Is the 660AV upgradeable to the Power Macintosh?

Answer: These logic board upgrades have been discontinued.

Question: Is it compatible with all third party monitors?

Answer: There are differences in the video port of the Quadra 840AV and the Quadra 660AV that may cause compatibility issues with some third party monitors. If a third party monitor isn't working with the built-in video, please contact the vendor of the monitor. You need to tell the vendor "The 840AV/660AV does not support sync on green." The vendor will need to provide a fix.

Question: Can I use a video board instead of the built-in video and still use the video-in capabilities of the Quadra 840AV and the Quadra 660AV?

Answer: No, the video-in capabilities on the new AV Macintosh computers will only work with the internal video of the Macintosh.

Question: Can I use another video card with my AV Macintosh?

Answer: Yes, however you will not be able to use the video-in capabilities of for that card.

Question: Will a future AV Macintosh connect directly to the AV monitor?

Answer: You will always need the adapter cable.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature).

The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Article Change History:
01 Jul 1996 - Added Fax Doc Word
30 Aug 1995 - Changed references to Power Macintosh logic board upgrades.
25 May 1995 - Added VRAM information to answer and indicated upgrades have been discontinued.
08 Feb 1995 - Revised Discussion, updated formatting.

QuickTime Versions, System Requirements, Installation (5/95)

==========

Article Created: 27 September 1993
Article Reviewed/Updated: 24 May 1995

TOPIC -----

QuickTime is the multimedia architecture for the Macintosh computer family. It allows any color-capable Macintosh to integrate dynamic data types such as video, sound, and animation into presentations, training materials, and documents. Hundreds of commercial applications support QuickTime.

DISCUSSION -----

Four Components

The QuickTime architecture has four key components:

- True synchronization of streams of information in time -- video and sound, for example, using the movie controller.
- A variety of compression schemes, to minimize storage requirements.
- A standard graphical interface for navigating, manipulating, and editing data.
- A rich, flexible file format that readily accommodates these new information types.

QuickTime 1.5 Features

Compared to earlier versions, QuickTime 1.5 provides:

- Larger screen software-only movie playback. Up to 320 x 240 pixels at up to 15 frames per second, or four times the screen area on a Macintosh LC II. Movies on screen will now be twice as big. Alternatively, you can play back movies of 160 x 120 pixels at up to 30 frames per second on a Macintosh LC II.

- Integrated support for Kodak Photo CD allows digitizing photos onto a CD-ROM where QuickTime can access them. Features include easily viewed "thumbnails," QuickTime overview movie of photo images, and file-format translation -- so you can paste Photo CD images into any Macintosh application that supports PICT files.

- Improved CD-ROM data handling for enhanced QuickTime movie playback from a CD.

- Improved network performance for better CD playback over a network.

- Faster 1-bit dithering offers enhanced and smoother viewing of QuickTime movies on PowerBook computers and other monochrome computers.

- Generic media handlers allow developers to incorporate different data types into QuickTime movies to create new movie track types.

- Text Track, a new feature that allows integration of texts into QuickTime movies.

- Human Interface support for compression settings, sound input devices, and video digitizers. Developers can now easily change settings and features in their hardware.

QuickTime 1.6 Features

- Significantly improved performance, sound, and graphics support.

- Movies play back more than 10 percent faster than the previous version 1.5, delivering smoother playback.

- The new sound manager provides customers using third-party sound cards with the ability to input and play back CD-quality, 16-bit sound from QuickTime movies. Sound Manager version 3.0 completely replaces the existing Sound Manager, and it works with all versions of QuickTime. If Sound Manager 3.0 is installed, QuickTime 1.6 will take advantage of its new features.

- A Movie Import component allows you to open Audio CD tracks from QuickTime's Standard File Preview dialog, just as you could open PICS and AIFF files with QuickTime 1.5. If you have an AppleCD 300 or 300i drive, you can use QuickTime 1.6 to convert tracks of your favorite audio CD directly into QuickTime movies.

- By supporting ColorSync, Apple's color-matching technology, QuickTime 1.6 will ensure that colors in a movie played on one color monitor will be the same when played on any other color monitor.

- QuickTime 1.6 requires 90 percent less memory than the previous version when installed, giving Macintosh customers with entry-level computers more flexibility when installing QuickTime.

QuickTime 1.6.1 Fixes

QuickTime 1.6.1 fixed problems with the Alias Manager, incompatibilities with NOW and HAM utilities extensions, and with the decompressor for Photo CD.

QuickTime 2.0

QuickTime 2.0 is significant because it provides larger video at faster frame rates, support for music, and support for interactive television applications.

Larger, Faster, TV Like Video

Video on computers is often confined to small windows and played at less than 12 frames per second, making the video appear rough and jerky. QuickTime 2.0 provides greatly increased performance resulting in full-screen movies without the addition of any hardware. This closely resembles what viewers see on television today. For example, on a Macintosh LC 475, one of Apple's lowest-cost computers, 30 frames per second video is possible at a resolution of 320 x 240, or full-screen video (640 x 480) is possible at 15 frames per second.

Key components of the new video enhancements are new features that support professional-level video editing. QuickTime 2.0 includes support for time-code, 60 fields per second video and high data throughput greater than 3 MB per second. This represents a 300 percent increase over previous versions of QuickTime.

Interactive Television Support

QuickTime 2.0 creates an infrastructure for development and delivery of interactive television applications through MPEG support and network enhancements. Now, with its new device protocols, QuickTime can address distributed networks and devices, such as video servers, on the information superhighway.

QuickTime 2.0 supports MPEG, widely regarded as the industry-standard method of delivering video into the home for interactive television applications such as Video On Demand (VOD) and home shopping. However, MPEG, by itself, allows only playback. With QuickTime 2.0, users of MPEG-based devices will be able to edit, search for, interact with, as well as play back—video information.

Note:
QuickTime requires additional hardware for MPEG playback.

Music For The Masses

Building on Apple's industry renowned ease-of-use, QuickTime 2.0 makes it much easier for computer users to create, edit, playback and synchronize music with video—all without a technical understanding of MIDI technology. In the past, users of Macintosh computers and other personal computers have required an

understanding of MIDI technology in order to create and playback music on computers.

In addition, QuickTime 2.0's music capabilities will save disk space for users, because QuickTime music tracks are much smaller than digital audio. For example, Beethoven's 5th Symphony could easily fill a 300 MB hard disk if stored as CD-quality audio, but when represented as a QuickTime music track it would fill just a single 800K floppy disk.

Compatibility with Older Versions of QuickTime

Movies created with earlier versions of QuickTime will playback with QuickTime 2.0, and usually they will playback more smoothly.

Applications and tools which support early versions of QuickTime, Movie Player and Movie Converter for example, will playback QuickTime 2.0 movies.

QuickTime 2.0 Availability

Developers: QuickTime 2.0 and QuickTime for Windows 2.0.x are available to software developers on the QuickTime Software Developer Kit (SDK) through APDA, and include licensing agreements from Apple's Software Licensing division.

End Users: QuickTime 2.0 for Mac OS is available as part of System 7.5 or can be downloaded from CompuServe (GO QTIME) for a small fee.

QuickTime 2.0 for Windows is available from CompuServe for a small fee (GO QTIME).

QuickTime 2.0 for both Mac OS and Windows can also be downloaded from the internet for a small fee. It is available from the WWW site:

http://quicktime.apple.com

All earlier versions of QuickTime are no longer available and have been removed from Apple SW Updates.

Most QuickTime products also include a copy of QuickTime.

System Requirements

QuickTime requires a Macintosh computer with a 68020 or later microprocessor, with system software version 6.0.7 or later. Apple recommends at least 4MB of memory when using QuickTime with System 7. QuickTime relies on the capabilities of 32-bit QuickDraw, which only runs on 68020 or later Macintosh computers.

If you want to use QuickTime on an older Macintosh, you might be able to upgrade the unit or use a third-party board to bring it up to a 68020 microprocessor or higher. QuickTime will then work with System 7 installed, or with the 32-bit QuickDraw file installed in system 6.0.5 or 6.0.7.

Installation

To install, simply drag the QuickTime extension to your System Folder and restart. Please note that the Installer for QuickTime Starter Kit 1.0 will replace QuickTime versions 1.5, 1.6, 1.6.1, or 2.0 with 1.0. Just reinstall the QuickTime 1.5, 1.6, 1.6.1, or 2.0 extension. QuickTime 2.0 also has additional components that need to be installed including QuickTime PowerPlug (For use only on Power Macintosh computers), and QuickTime Musical Instruments (for MIDI playback). Both the QuickTime PowerPlug and QuickTime Musical Instruments go in your Extensions folder.

With System 6.0.7, the 32-bit QuickDraw file is located on the Printing Tools disk in the Apple Color folder and is not automatically installed. You must install it manually. With System 7 and later versions, 32-bit QuickDraw is built into the system software, and a separate file for 32-bit QuickDraw is no longer required.

If QuickTime movies don't play in the Scrapbook, follow these steps:

1) Copy the Scrapbook DA from the QuickTime disk to your Apple Menu Items folder.

2) Replace your existing Scrapbook DA.

System 6: Removing Fonts and Desk Accessories (9/94)

Revised: 3/27/95
Security: Everyone

System 6: Removing Fonts and Desk Accessories (9/94)

==========

Article Created: 27 September 1993
Article Reviewed/Updated: 7 September 1994

TOPIC ----------

This article gives instructions for removing fonts and desk accessories (DAs) from a System file. It applies only to Macintosh systems that use a version of System 6.

DISCUSSION ----------

Change from MultiFinder to Finder

Font/DA Mover 4.1 can remove desk accessories, but can't remove fonts from the startup System file while in MultiFinder. If you aren't using MultiFinder, skip to the "Use Font/DA Mover" section. If you try to remove fonts, a message appears. Click the OK button.

You now have three options to change from MultiFinder to Finder:

- Restart and Press Command Key
  Choose Restart from the Special menu and hold down the Command key. This temporarily disables MultiFinder. Choosing Restart again enables MultiFinder.

- Restart with a System Floppy Disk
  1) Choose Restart from the Special menu.
  2) Put a System disk in the main floppy drive right after you hear the chime.

- Set Startup to Finder Only
  1) Choose Set Startup... from the Special menu. A dialog box appears.
  2) Click the Finder radio button (the Finder Only radio button highlights at the same time).
  3) Click the OK button.

4) Choose Restart from the Special menu.

Use Font/DA Mover

You are now ready to remove fonts from your System file. If you don't already have Font/DA Mover 4.1 on your hard disk, copy the application to your hard disk now.

Note: If you have older versions of Font/DA Mover on your hard disk, drag them to the Trash and choose Empty Trash from the Special menu. Using an older version can damage your System file!

1) Double-click the Font/DA Mover 4.1 application. (Hold down the Option key before launching Font/DA Mover 4.1 to display desk accessories first rather than fonts. The scroll box on the left then shows the desk accessories currently installed in your System file. Follow steps 2-4, substituting desk accessories wherever you see fonts.) The Font/DA Mover screen appears.

   The scroll box on the left shows the fonts currently installed in your System file. The title below the scroll box, "System on Macintosh HD," indicates the location of the fonts.

2) Select the fonts you want to remove by one of two methods:

   - Drag over the list on the left while pressing the mouse button.
   - Or you can hold down the Shift key and click each font. You can select items that aren't next to each other by this method.

   Font/DA Mover displays the selected fonts in reverse type (white letters on a black background).

3) Click the Remove button to remove the selected fonts. A message appears.

4) Click the OK button. Font/DA Mover removes the fonts, and they no longer appear in the left window of the screen.

5) To remove desk accessories and fonts during the same session, click the Font or Desk Accessory radio buttons at the top of the Font/DA Mover window.

6) When you're finished, click the Quit button to go back to the desktop (Finder).

7) If you previously chose to Set Startup to Finder Only, repeat the steps in that section, but click the MultiFinder radio button rather than the Finder radio button.

Where Do I Find PC/TCP Software (6/95)

Revised: 6/29/95
Security: Everyone

Where Do I Find PC/TCP Software (6/95)

==========

Article Created: 27 September 1993
Article Reviewed/Updated: 29 June 1995

TOPIC -----

Where do I get PC/TCP which is an equivalent of MacTCP for PCs? I'm involved in an evaluation of the Farallon PhoneNet PC/Timbuktu products, and I need access to TCP/IP.

DISCUSSION -----

PC/TCP can be obtained from FTP Software of Wakefield, Massachusetts. The latest version is 2.2 and requires DOS 3.3 or later, 640K, hard disk and a network card. To locate a vendor's address and phone number, use the vendor name as a search string.

PowerShare: Installing a Server (9/93)

Revised: 9/28/93
Security: Everyone

PowerShare: Installing a Server (9/93)

==========

Article Created: 28 September 1993

TOPIC ----------

This article describes how to install a PowerShare Server.

DISCUSSION ----------

1) Install PowerShare. Launch the installer from the PowerShare CD-ROM or set of floppy disks. Use the default Easy Install selection when installing PowerShare.

2) After the installation is complete, restart the Macintosh.

3) Run PowerShare Easy Setup. The installation process installs an alias to the PowerShare Easy Setup application in the Startup Items folder inside the System Folder. Upon restart, the PowerShare Easy Setup application will launch.

4) In the PowerShare Easy Setup application, click the New button.

5) A dialog box appears, asking whether this is a new PowerShare system or an existing one. Click the New button.

6) You will be prompted to type a name for this PowerShare system and a password for the Administrator. Type in the inforamtion and click the OK button.

(Note: the PowerShare System Administrator name cannot be changed.)

7) Wait for PowerShare to start. You will see a series of dialog boxes informing you that the PowerShare Catalog Server is starting and then that the PowerShare Mail Server is starting.

8) Confirm that the servers are running. At this point, the PowerShare Catalog Server and the PowerShare Mail Server should be running. Each

server will display a separate server status window.

PowerShare: Adding a Catalog Server (9/93)

Revised: 9/28/93
Security: Everyone

PowerShare: Adding a Catalog Server (9/93)

==========

Article Created: 28 September 1993

TOPIC ----------

How do I add another PowerShare Catalog Server?

DISCUSSION ----------

An important feature of your PowerShare System is the ability to replicate and distribute the contents of catalogs across the network. If there is excessive load on a server, you can create another server and use it to store catalog folders—without altering the structure of the catalog.

However, it is not possible to have more than one PowerShare Catalog Server running on a Macintosh at the same time. You need another Macintosh with the following minimum requirements:

• At least one Macintosh computer (using a 68020 or later processor) with a hard disk.

• A minimum of 4 megabytes of memory for each installed server.

• If both the PowerShare catalog server and the PowerShare mail server are installed on the same computer you will require at least 8 MB.

• The PowerShare Server system requires system software version 7.1.1 or later. (The PowerShare Installer will install System 7.1.1 if it is needed.)

Setting up an additional PowerShare Server:
---

1) Install the PowerShare software on the Macintosh where the new server will reside. Upon restart, the PowerShare Easy Setup application starts and displays a dialog box informing you that the Easy Setup application requires some information to set up the PowerShare System.

2) Click the Later button in the dialog box.

3) Open the PowerShare Server Folder and double-click on the PowerShare Catalog Server application to start it. A dialog box appears, asking whether you want to create a new PowerShare System or join an existing System.

3) Click the Join Existing button. A dialog box appears, prompting you for an administrator name and password and asking you to select a PowerShare Catalog to join.

4) Choose a PowerShare System from the pop-up menu at the top of the window. If the System you want to join is not listed in the menu, choose Other. The PowerShare Admin application begins searching for available catalogs on the network, displaying a dialog box that indicates that a search is in progress. Depending on the size of the network, the search can take from a few seconds to several minutes. Click Cancel to terminate the search. When all PowerShare Systems have been located, a dialog box appears listing the names of the available PowerShare Systems. For example: In the list of PowerShare Systems, click the System you want to join then click OK. Now that you have selected a System to administer,you can complete the logon by providing the administrator name and password.

5) In the appropriate fields, type the administrator name and password that was specified when the catalog System was set up.

6) When the information is complete, click the OK button. When your identity is authenticated, a dialog box appears asking you for a name for the new PowerShare Catalog Server. The new server must have a unique name. By default, the name of your Macintosh is supplied as the server name.

7) In the Server Name field, type a unique Catalog Server name.

8) Click the OK button. The Server application creates the new PowerShare Catalog Server. The new server name is registered for use on the network and a status window appears, displaying information about the server's operation. You can see from the status window that the new server has joined the catalog structure of the selected PowerShare System. If the System Manger Utility is also running, the System Monitor window will now list the new server. Because the Catalog Server is brand new, no catalog folders are stored on it. You can now begin adding folders and assigning their contents to the new Catalog Server or you can use the new server to store copies of existing folders.

PowerShare Server: Primary Services Provided (9/93)

Revised: 9/28/93
Security: Everyone

PowerShare Server: Primary Services Provided (9/93)

==========

Article Created: 28 September 1993

TOPIC ----------

What are the services that a PowerShare server can provide out of the box?

DISCUSSION ----------

The PowerShare Servers provide three primary services that enable a wide range of collaborative applications:

1) Catalog services. A shared, centrally-administered catalog which can be used by users and collaborative applications.

2) Authentication services. The Catalog Server acts as a trusted third party in establishing authenticated network connections.

3) Mail services. A store-and-forward mail and message server. Catalog services In a PowerShare System, the catalog is a collection of records stored in folders on one or more PowerShare Catalog Servers. Each catalog record contains information about an entity in the PowerShare System, which can be a user, group of users, network device (such as a printer or file server), purchase order forms, or meeting rooms.

PowerShare: Minimum Server Requirements (9/93)

Revised: 9/28/93
Security: Everyone

PowerShare: Minimum Server Requirements (9/93)

==========

Article Created: 28 September 1993

TOPIC ----------

This article describes the minimum system requirements for a PowerShare server.

DISCUSSION ----------

You'll need the following hardware to set up a PowerShare Server system:

• At least one Macintosh computer (using a 68020 or later processor) with a hard disk.

• A minimum of 4 megabytes of memory for each installed server.

• If both the PowerShare catalog server and the PowerShare mail server are installed on the same computer you will require at least 8 MB.

• The PowerShare Server system requires system software version 7.1.1 or later.

Notes:

If this version of system software is not already installed on the Macintosh computers that will be running the server software, the Installer will automatically update the system software during installation.

The system can be administered from the same computer on which the servers are installed or from any other computer on the network on which the PowerTalk system software has been installed. The computer serving as the administration station can be any Macintosh computer with at least 5 megabytes of memory.

PowerShare Server: Authentication Services (9/93)

Revised: 9/28/93
Security: Everyone

PowerShare Server: Authentication Services (9/93)

==========

Article Created: 28 September 1993

TOPIC ----------

This article describes the PowerShare Server's Authentication Services.

DISCUSSION ----------

The authentication service allows collaborating users and applications to interact over a network by positively verifying the identity of each party. This verification protects against unauthorized access by parties masquerading as legitimate users or services.

In providing the authentication service a PowerShare Catalog Server acts as a trusted third party by maintaining an authentication key for each user, application, or other entity that has a record in the catalog. Collaborative services and applications will use the Catalog Server to authenticate themselves in order to communicate with other users and services. Once an authenticated session is established, transmissions across the network are encrypted to prevent unauthorized tapping of the network media.

PowerShare authentication and privacy services permit collaborative applications to securely exchange and transmit sensitive information such as financial records or personnel information.

PowerShare Server: Mail Services Description (2/95)

Revised: 2/9/95
Security: Everyone

PowerShare Server: Mail Services Description (2/95)

==========

Article Created: 28 September 1993
Article Reviewed/Updated: 9 February 1995

TOPIC ----------

This article describes the PowerShare Server's Mail Services.

DISCUSSION ----------

PowerShare Mail Servers provide the routing and storage for data exchanged between users and applications. Data is exchanged between users in the form of letters; data is exchanged between applications in a format known as messages.

Letters and messages are stored in containers known as queues on the hard disk on which a Mail Server is installed. To exchange letters and messages through PowerShare Mail Servers, a user or application (or other entity such as a printer) must have a queue on a PowerShare Mail Server.

A record for the Mail Server is stored in a PowerShare catalog folder. This record provides information about how the Mail Server is used to store and forward messages and letters.

Your PowerShare System also provides access to other mail systems. It does this through gateways, software, and/or hardware products, allowing devices on your network to communicate with other networks running different messaging protocols.

PowerShare: Moving Servers (9/93)

Revised: 9/28/93
Security: Everyone

PowerShare: Moving Servers (9/93)

==========

Article Created: 28 September 1993

TOPIC ----------

How do I move a PowerShare server from one Macintosh to another Macintosh?

DISCUSSION ----------

Every PowerShare server includes the application, its data files and a preferences file. By moving a PowerShare Catalog Server, you can maintain your PowerShare catalog structure without having to rebuild the PowerShare System by recreating the folder hierarchy and all your data records. The list below identifies the tasks you must perform when moving the server to a new location:

1) Reinstall the Server software from the original disks.

2) From the top folder level,copy the PowerShare Catalog Data folder and PowerShare Mail Data folder to the top folder level on the new disk or volume.

3) From the Preferences Folder in your System Folder, you also need to copy the files PowerShare Catalog Prefs and PowerShare Mail Prefs. These files should both be copied to the Preferences folder on the new Macintosh. (You don't need to move these items if you are moving the servers to another volume that won't be a startup volume.)

Note: After you restart the servers you have moved to a new location, you may need to identify the volume on which they are stored.

PowerShare Server: Catalog Services (9/93)

Revised: 9/28/93
Security: Everyone

PowerShare Server: Catalog Services (9/93)

==========

Article Created: 28 September 1993

TOPIC ----------

This article describes the PowerShare Server's Catalog Services.

DISCUSSION ----------

In a PowerShare System, the catalog is a collection of records stored in folders on one or more PowerShare Catalog Servers. Each catalog record contains information about an entity in the PowerShare System, which can be a user, group of users, network device (such as a printer or file server), purchase order forms, or meeting rooms.

The structure of the PowerShare catalog is easily customized to fit your organization's needs. For example, you can design the catalog to reflect organizational hierarchy, function, geographic distribution, or the type of information stored.

Within each record, information about the entity is stored as a collection of attributes. For example, a record named "William Smith" of the type "User" can store information about that user such as telephone number, building, and so on. Another record named "ColorPrint" of the type "LaserWriter" can store information about a printer.

In a collaborative environment, a catalog can be used by users and by PowerTalk-savvy services and applications to locate entities, store information, indicate status, or provide any other type of information that may be required by collaborative applications.

In the same way that you can arrange files in folders on your Macintosh desktop, you store records in containers known as catalog folders. Each catalog folder in the PowerShare System can contain records or other catalog folders. You can use the PowerShare Admin provided with your server software to administer the catalog structure; creating folders and manipulating the catalog structure to fit your needs. The PowerShare

software provides built-in templates that allow you to quickly create records that you can use to store information about individual users and groups of users in your organization.

The structure of the PowerShare catalog is easily customized to fit your organization's needs. For example, you can design the catalog to reflect organizational hierarchy, function, geographic distribution, or the type of information stored. The figure below represents the hierarchical structure of a PowerShare System catalog, designed by an administrator to reflect the organization of a fictitious company.

With the PowerShare Admin, you can manage the structure of the PowerShare catalog in much the same way as you manage folders and files in the Macintosh Finder.

Keep in mind that the hierarchical structure of folders is simply a means of organizing and managing information—it does not necessarily represent network connectivity or physical proximity.

PowerShare: Replicating a Folder (9/93)

Revised: 9/28/93
Security: Everyone

PowerShare: Replicating a Folder (9/93)

==========

Article Created: 28 September 1993

TOPIC ----------

How do I replicate a folder on a PowerShare Catalog Server?

DISCUSSION ----------

Use the PowerShare Admin application to replicate a folder on any existing PowerShare Catalog server. Replication of folders provides better performance in larger or frequently accessed folders by shifting the workload between servers.

To replicate a folder:

1) Start the PowerShare Admin application if is not already running and switch to Manage Mode.

2) In the System window, select the catalog server on which you want to store the folder copy and click the Open button.

3) When the server window opens, choose Catalog Folders from the pop-up menu of display options.

4) Open the Catalog window and display the folder that you want to replicate.

5) From the Catalog window, drag the folder icon to the "Catalog Folder Name" area at the bottom of the server window. When you release the mouse button, the folder now appears in the listing of catalog folders residing on the selected server.

The load for managing the folder will now be distributed between the two servers on which it resides. Notice that on the Macintosh where the newly added server is running, the status window for the server now indicates that it is serving the specified folder. From now on, any change you make

to the folder is replicated on both servers.

Note: In the catalog window, the replicated folder is still only represented as a single folder; replication does not affect the organizational structure of the catalog.

PowerShare Server: PowerShare Admin (9/93)

Revised: 9/28/93
Security: Everyone

PowerShare Server: PowerShare Admin (9/93)

==========

Article Created: 28 September 1993

TOPIC ----------

This article describes the functionality of the PowerShare Admin application.

DISCUSSION ----------

The PowerShare Admin application provided with the PowerShare Server product package is a utility that the system administrator can use to monitor and manage the workings of a PowerShare System. The system administrator will use PowerShare Admin to:

- monitor and manage the operations of PowerShare System servers and gateways.
- manage the catalog containing folders and records.

The PowerShare Admin application provides two modes of operation: Monitor mode and Manage mode. In Monitor mode, you can view a listing of servers on the PowerShare System. When running in this mode, PowerShare Admin can be set up in a public location where users can observe the operations of the PowerShare System.

When PowerShare Admin is in Manage mode, an administrator can use the application to manage all aspects of the System, including the catalog and individual records.

Note: The PowerShare Admin will not run on a Macintosh on which the PowerTalk software has been turned off in the PowerTalk control panel.

PowerTalk: Troubleshooting Common Problems (9/93)

==========

Article Created: 28 September 1993

TOPIC -----

This article describes common problems and solutions when using PowerTalk.

DISCUSSION -----

Registration problems

Problem: You get a dialog box reporting that there is someone else with your name in the same catalog. The two names are differentiated by a creation ID.

Solution: Check with your administrator to be sure which creation ID is yours.

Access to catalogs and services

Problem: You can't find the Key Chain icon or you've thrown it away.

Solution: To create a new Key Chain, go to the PowerTalk Setup control panel and click the Key Chain button.

Problem: You can't find the Mailbox or the Catalogs icon.

Solution: PowerTalk is probably turned off. Go to the PowerTalk Setup control panel and activate PowerTalk.

Problem: AppleTalk or PowerShare catalogs are dimmed in the Catalogs window.

Solution: Go to the Chooser and activate AppleTalk.

Problem: You get a message that the system can no longer access a server

on your network. In some cases a Resolve button appears in the notification dialog box.

Solution: Click the button to reconnect. Check the cable connection on the back of your computer.

PowerShare: Only One Catalog Server Per Macintosh (9/93)

==========

Article Created: 28 September 1993

TOPIC ----------

Can I run more than one PowerShare catalog server on a single Macintosh?

DISCUSSION ----------

No, you cannot have more than one PowerShare Catalog Server running on a Macintosh at the same time. You must set up additional servers elsewhere on your network.

Note: You can install and run one PowerShare Catalog Server and one PowerShare Mail Server on a single Macintosh.

PowerShare: Setting up a Mail Connection (9/93)

==========

Article Created: 28 September 1993

TOPIC ----------

How do I set up a PowerShare Mail Connection?

DISCUSSION ----------

Use the PowerShare Admin application to set up a mail connection between the PowerShare System and a foreign mail system running on the same network. A mail connection allows users of AppleMail to exchange messages with users of other mail applications, including AppleLink and QuickMail.

To set up a mail connection, you must first install and run a third-party gateway application that oversees communications between different types of mail systems. You must install and run the gateway on the same Macintosh on which a PowerShare Mail Server is installed and running.

Follow these steps to set up a gateway:

1) Start the gateway application installed on the Macintosh on which a Mail Server is running. Depending on the type gateway you installed, you will be asked to provide a gateway name and password. At some point in the set up, the gateway will establish communications with the PowerShare Mail Server, which will ask you to identify yourself with an administrator name and password.

2) Enter the appropriate name and password, then click OK. The Mail Server creates a record for the gateway and stores it in the System Catalog. It also creates a queue for the gateway, allowing it to store messages on the Mail Server. The Mail Server then returns control to the gateway. The gateway completes its set up process. Now you can use the PowerShare Admin application to set up a connection to a foreign mail system through the gateway.

Follow these steps to set up a mail connection:

1) Open the PowerShare Admin application and choose the system on which you installed the gateway. The Servers window should display the newly installed gateway.

2) Switch to Manage mode and choose Show Mail Systems Window from the Servers menu A Mail Systems window for the current PowerShare System appears. If you have not yet established any external mail systems the window is empty.

3) Click the New button. The New Mail System dialog box appears, asking you to create a new mail system.

4) In the Name field, type a name for the mail link.

5) Choose the type of mail connection: Open the Type pop-up menu and choose a mail system. Choose the type of mail system you will be connecting; some examples include AppleLink, QuickMail and Microsoft Mail.

6) Open the Gateway pop-up menu and choose the gateway that you are using to make the connection. Any gateways currently installed on the PowerShare System are listed in the pop-up menu.

7) Click Create. The PowerShare Admin application creates the new Mail Link, which is now displayed in the Mail Systems window. With the Mail Link in place, PowerTalk users on the network can now begin exchanging messages with users on the foreign mail system.

Performa 410: RAM Expansion Details (10/93)

==========

Article Created: 18 October 1993

TOPIC -----

This article describes the RAM expansion details for the Performa 410.

DISCUSSION -----

The Performa 410 includes both RAM soldered onto the logic board as well as mounted in the two SIMM (Single Inline Memory Module) slots on the logic board.

Performa 410 RAM expansion:
- Supports 30-pin, 80 ns (nanoseconds) DRAM SIMMs only.
- Supports the following SIMM sizes: 1, 2, or 4MB DRAM SIMMs.
- Does not support 256K SIMMs.

Article Change History:
21 October 1993 - Removed erroneous reference to 8, 16, and 32MB SIMMs.

Performa 410: Specifications (7/94)

==========

Article Created: 18 October 1993
Article Reviewed/Updated: 26 July 1994

TOPIC ----------

This article provides technical specifications for the Macintosh Performa 410 computer.

DISCUSSION ----------

Microprocessor

- MC68030, 32-bit architecture, 16 MHz clock speed
- CMOS custom clock/calendar with long-life lithium battery

Memory

- 4MB RAM on logic board, expandable to 10MB via two SIMM slots using 30-pin, 80ns (nanosecond) SIMMs.
- 512K Video RAM (VRAM)

Video Display

- Apple Performa Display standard:
  - 14-inch color display
  - 640 by 480 pixels
  - 0.39 mm dot pitch
  - Meets the strictest international magnetic-field emissions guidelines (SWEDIAC MPR2)
  - 256 colors displayed with standard 512K VRAM

Storage

- One internal SuperDrive 1.4MB high-density floppy-disk drive, reads disks from Macintosh, Apple II, MS-DOS, and Windows systems.

- One internal 80MB SCSI hard disk drive
- Optional external SCSI hard disk drive (many capacities available)
- Optional external AppleCD CD-ROM drive

Modem

- TelePort/Bronze for Macintosh Performa
  (from Global Village Communication, Inc.)
- GlobalFax software (send-only fax) for 9600-baud faxing from any
  application to fax machines worldwide (upgradable to receive fax via
  software)
- Modem also serves as 300/1200/2400-baud data modem
- No separate power adapter required

Power Input

- Line voltage: 90 to 240 volts AC, RMS automatically configured
- Frequency: 47 to 63 Hz single phase
- Power: 50 watts maximum, not including display power

Interfaces

- One Apple Desktop Bus (ADB) port supports a keyboard, mouse, and other
  devices daisy-chained through a low-speed, synchronous serial bus
- Two serial (RS-232/RS-422) ports, 230 kilobits per second maximum
  (up to 0.920 megabits per second if clocked externally)
- SCSI interface for connecting up to six external devices
- Video port supports RGB and monochrome monitors of various sizes and
  resolutions
- Sound output port capable of delivering monophonic sound to both
  channels of a stereo device
- Sound input port for monaural sound input
  (monaural 8-bit sound, sampled at 22 or 11 kHz)
- Internal expansion slot for one processor-direct expansion card

Keyboard and Mouse

- Apple Desktop Bus (ADB) keyboard with numeric keypad and two-level tilt
  adjustment
- Apple ADB Mouse II

Apple Desktop Bus Power Requirements

- Maximum current draw for all ADB devices: 200 milliamperes (mA)
- Recommended maximum of three ADB devices
- Mouse draws 10 mA
- Keyboard draws 25 mA

Microphone

- Hands-free omnidirectional electret microphone included

Sound Generator

Custom sound chip, including mono sampling generator capable of driving stereo miniature phone jack headphones, or stereo equipment by sending the same output into each channel.

Software

- Macintosh System Software version 7.1P5 with Launcher, designed specifically for Performa computers.
- At Ease software lets adults share the computer with children -- while protecting valuable data.
- Macintosh PC Exchange lets you work with MS-DOS and Windows disks.
- Application software: a selection of productivity and communication tools already installed on the hard drive.
  - ClarisWorks 2.0 by Claris
  - Quicken 4 by Intuit
  - Best of Homeworks Templates by Paradygn
  - Click Art Performa Collection by T/Maker
  - TelePort Fax/Modem software by Global Village
  - American Heritage Dictionary 3rd Edition by WordStar
  - Mario Teaches Typing by InterPlay
  - Spectre Challenger by Velocity & Pennisula Gameworks
  - Super Munchers by MECC

Disability Access

- CloseView, Easy Access, and "visible beep" software are built in.
- Third-party options provide other alternative input and output devices

Size and Weight

- Main Unit
  Weight: 8.8 pounds (4.0 kg)
  Height: 3.2 inches (81 mm)
  Width: 12.2 inches (310 mm)
  Depth: 15.0 inches (382 mm)

- Mouse
  Weight: 4 ounces (0.10 kg)
  Height: 1.3 inches (33 mm)
  Width: 2.4 inches (61.7 mm)
  Depth: 4.2 inches (107.3 mm)

- Keyboard
  Weight: 2 pounds (1 kg)
  Height: 1.8 inches (44 mm)
  Width: 16.5 inches (418 mm)
  Depth: 5.6 inches (142 mm)

Environment

- Operating temperature: 10 to 40 C (50 to 104 F)
- Storage temperature: -40 to 47 C (-40 to 116.6 F)

- Relative humidity: 20% to 80% (noncondensing)
- Maximum altitude: 3048 m (10,000 ft.)

Service and Support

- One year limited warranty
- One year free in-home service
- Toll-free help line
- Support for non-Apple software is provided by the respective software publishers.

Ordering Information

- M1985LL/A - Macintosh Performa 410 with 4MB of RAM and an internal 80MB hard disk.

Article Change History:
26 Jul 1994 - Expanded sound generation capabilities.
10 Dec 1993 - Changed System Software version to 7.1P5.
16 Nov 1993 - Deleted reference to FPU socket
26 Oct 1993 - Eliminated references to displays other than the bundled one.

Performa 410: Description (10/93)

==========

Article Created: 18 October 1993

TOPIC ----------

This article describes the Macintosh Performa 410 computer.

DISCUSSION ----------

Overview

The Apple Macintosh Performa 410 is the perfect choice for families looking for an entry-level color computer. Packed into one box are the computer, monitor, keyboard, mouse, and fax/modem, as well as operating system and application software.

All the hardware and software you need to get started is included. Just take the computer out of the box, connect the display, attach the keyboard and mouse, plug in the power cord, and turn the computer on. On-screen tutorials help you achieve basic Macintosh skills.

Running at 16 megahertz (MHz), the Macintosh Performa 410 can display 256 colors on its 14-inch Apple Performa Display. The 80 megabyte (MB) hard disk drive provides ample storage. Pre-installed System 7 software (version 7.1P) has been customized to provide enhanced functionality and ease of use. For instance, the Launcher allows you to easily open the programs you use most often. The software for word processing, calculations, graphics and communications comes built in.

With the accompanying TelePort/Bronze fax/modem from Global Village Communications, you can use your Macintosh Performa to send faxes and electronic mail to the office or to friends. You can also tap financial, travel, educational, and news services.

Multimedia ready, the Macintosh Performa 410 computer is equipped with built-in digital sound and speaker and is ready to add a CD-ROM drive. You can grow your systems simply by plugging in printers, scanners, hard

disks and other SCSI devices -- there's no need to buy or install separate expansion cards.

Power and speed

• 16-MHz 68030 microprocessor
• 32-bit architecture

Memory

• 4MB of RAM on board, expandable to 10MB via two 30-pin SIMM (single inline memory modules) slots.
• Requires 80 nanosecond (ns) SIMMs.

Displays

• Comes standard with Apple Performa Display
- 14-inch RGB color display
- 640 by 480 pixels
- 0.39 mm dot pitch
- Non-interlaced
- Meets the strictest international magnetic-field emissions guidelines (SWEDIAC MPR2)
- 256 colors displayed with standard 512K VRAM

Expansion

• Internal expansion slot for one processor-direct expansion card
• Seven built-in ports for peripherals

System Software

• System software version 7.1P with multitasking, file sharing, QuickTime, Balloon Help, TrueType, and more

Networking

• Built-in AppleTalk networking
• File sharing without a dedicated server

Compatibility

• Reads Macintosh, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats

Disability access

• CloseView, Easy Access, and visible-beep included with system software.
These built-in solutions and third-party options provide alternative input and output devices for people with disabilities.

What's in the box:

Each unit includes a Performa Display (monitor), TelePort/Bronze Data/Fax

modem, power cord, keyboard, keyboard cable, mouse, and system software.

System software includes System 7.1, System Enabler, Color Macintosh Basics, QuickTime 1.6, HyperCard Runtime, At Ease and Macintosh PC Exchange.

• Third Party bundled software includes:
 - ClarisWorks 2.0 by Claris
 - Quicken 4 by Intuit
 - Best of Homeworks Templates by Paradygn
 - Click Art Performa Collection by T/Maker
 - TelePort Fax/Modem software by Global Village
 - American Heritage Dictionary 3rd Edition by WordStar
 - Mario Teaches Typing by InterPlay
 - Spectre Challenger by Velocity & Peninsula Gameworks
 - Super Munchers by MECC

• Documentation included with the Performa 410:
 - Getting Started with your Macintosh Performa
 - Technical Information for the Macintosh Performa 400 Series
 - Macintosh User's Guide for Macintosh Performa computers

Ordering Information

• M1985LL/A - Macintosh Performa 410 with 4MB of RAM and an internal 80MB hard disk.

AppleSearch and AFP (9/93)

Revised: 10/1/93
Security: Everyone

AppleSearch and AFP (9/93)

==========

Article Created: 28 September 1993

TOPIC --------------------

I have received inquiries about AppleSearch. I understand that this product is a client/server type application. The server component runs on a 68030 or 68040 System 7 Macintosh workstation (not necessarily a server?). The client component is currently available for the Macintosh and may be available in the future for other platforms.

Will AppleSearch work with any AFP compliant volume, for example NetWare for Macintosh, System 7 file sharing, LAN Manager, or will it only work with a genuine AppleShare server volume?

DISCUSSION --------------------

The AppleSearch Server needs to run on a Macintosh computer that supports AFP (AppleTalk Filing Protocol) and PPC (Program to Program Communication).

The AppleSearch client software initiates the search on the AppleSearch Server via PPC in order to isolate the data handling on the server and optimize performance. (For this reason the data and indexes must reside on the AppleShare Server itself.) AFP is used to transfer the search results back to the client software.

At this time only Macintosh computers running System 7 File Sharing, AppleShare 3.0x, AppleShare 4.0, or AppleShare Pro can function as AppleSearch Servers.

AWS 80, AppleShare 4.0, and A/UX 3.0.1 (9/93)

Revised: 10/1/93
Security: Everyone

AWS 80, AppleShare 4.0, and A/UX 3.0.1 (9/93)

==========

Article Created: 28 September 1993

TOPIC ----------

I'm planning to purchase an Apple Workgroup Server (AWS) 80. I need to know if I can use it to backup existing DOS and UNIX fileservers. Will I require A/UX to do this, or does AppleShare 4.0 contain the needed software to allow Retrospect Remote to backup these foreign volumes? I'm running SCO UNIX, and have an Ethernet network. What additional software is needed, if any, to get TCP/IP and NFS compatibility? Is there an upgrade path to A/UX from AppleShare 4.0, if there is what is needed?

DISCUSSION ----------

According to Dantz, the current Retrospect or Retrospect Remote product for Macintosh OS can only recognize and backup Macintosh HFS file systems. Foreign volumes like DOS or UNIX file systems are not supported by Retrospect for Macintosh OS. Retrospect for A/UX is for the AWS 95 operating under A/UX 3.0.1. However, Retrospect is able to backup both HFS and UNIX volumes since UNIX volumes can be mounted as AppleShare volumes under A/UX 3.0.1.

Without upgrading to the AWS 95 running A/UX 3.0.1, here is what we think might be a solution for you. Have the following software installed and running on the AWS 80 (assuming SCO UNIX has NFS server capability):

• Install Pathway (NFS Mounter) from Wollongong Group. Pathway acts as an NFS client, then mount the NFS file system as an AppleShare volume.

• Install NFS/Share from InterCon Systems Corporation. It acts as an NFS client, then mount the NFS file system as an AppleShare volume.

Another possibility is to install CAP (Columbia AppleTalk Package) on your SCO UNIX computer which implements the AppleTalk protocol stack on a variety of UNIX machines. The main applications provide an AppleShare compatible server (aufs), a LaserWriter Spooler (lwsrv), and a program to

print to LaserWriters (papif).

To locate a vendor's address and phone number, use the vendor name as a search string.

Apple Internet Router 3.0 On Quadra 840AV and 660AV (11/93)

==========

Article Created: 28 September 1993
Article Updated/Reviewed: 10 November 1993

TOPIC ----------

What is the official response regarding the Apple Internet Router 3.0 running on a Quadra 840AV or Quadra 660AV? Are they supported? Have they been tested?

DISCUSSION ----------

The Macintosh Quadra 840AV and Quadra 660AV are compatible with the Apple Internet Router 3.0 software. Please note that the Apple Internet Router 2.0 has not been tested with either of these computers and should not be used.

Security: Everyone

Netware: Broadcast Message Character Limit (9/93)

==========

Article Created: 29 September 1993

TOPIC -----

My customer is sending a broadcast message from one Macintosh to another via a Novell server. They are suppose to be able to send 80 character messages but are being limited to 28-30 characters (like a PC). Is there something we can do to get around this?

DISCUSSION -----

This is a known problem to Novell that is improved by using the version of Network Tools that ships with 4.x, or with the 3.12 upgrade. The new limit is 44 characters.

AOCE Templates (8/94)

==========

Article Created: 4 October 1993
Article Reviewed/Updated: 23 August 1994

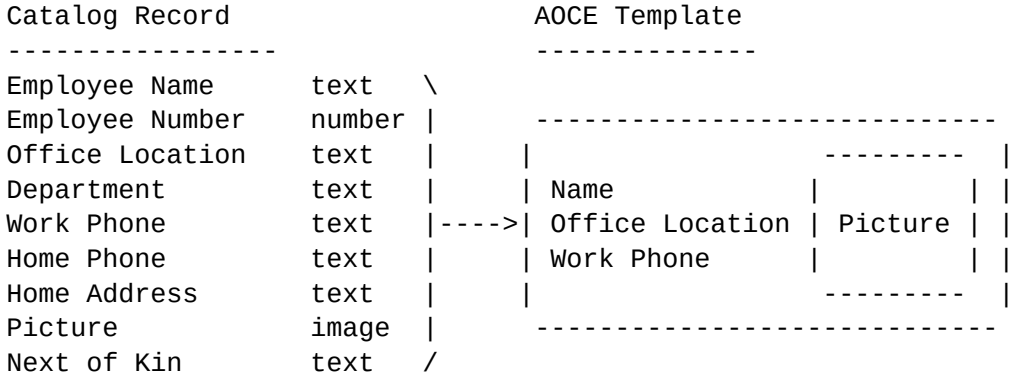
TOPIC ----------

This article describes AOCE Templates of Apple Open Collaborative Environment (AOCE).

DISCUSSION ----------

AOCE templates are system extensions that control how information in a catalog record is displayed on the screen. AOCE templates are common to all types of catalog services including catalogs on PowerShare Catalog Servers and those accessed through Catalog Service Access Modules.

There are times when it is neither desirable or appropriate to display all of the data resident in a catalog. An AOCE template can be written to display only the desired information and to display it in the appropriate manner.



Mapping attributes to AOCE template

Templates can have multiple pages of information, or they can be of any size or format necessary to best display information on that catalog

record.

Installing AOCE Templates
AOCE template files are system extensions. To install a new AOCE template, drop the template file into the System Folder and reboot.

Where do AOCE templates come from?
AOCE Templates are created by developers.

AOCE: Accessing Messages Remotely (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: Accessing Messages Remotely (10/93)

==========

Article Created: 4 October 1993

TOPIC ----------

This article describes Accessing Messages Remotely on Apple Open Collaborative Environment (AOCE).

DISCUSSION ----------

PowerTalk users may have a need to retrieve their PowerShare Server mail from remote locations. There are a couple ways to do this for server-based messaging.

If the user is at a Macintosh computer that is connected to the same network as the PowerShare Mail Server on which the user has an account, then the user can use the Visitor Mailbox feature to retrieve messages from that PowerShare Mail Server. Search for "Visitor Mailboxes" for details.

If the user is using a Macintosh computer that is not connected to any network, then it is still possible to retrieve PowerShare Mail Server based mail using AppleTalk Remote Access (ARA). In this scenario, the user would connect to the AppleTalk network containing their PowerShare servers and communicate as though the remote Macintosh computer were connected to the network locally. PowerTalk and PowerShare work the same over ARA as they do when connected to a local network.

This is not the same as using Direct Dialup mail in PowerTalk. Direct Dialup Mail is simply the ability of two Macintosh computers to call each other and deliver a message. Direct Dialup mail and ARA use the same connection scripts. However, they offer distinctly different types of services.

Direct Dialup mail only works between two PowerTalk workstations. There is no server-based dial up in the initial release of PowerShare. Two individual PowerTalk workstations can call each other and exchange

messages. However, it is not possible to send an AOCE message to a PowerShare account and have the server call the destination whether the destination is either another server or an individual workstation. PowerShare Mail Servers do not support Direct Dialup mail.

While ARA can be used to access messages in PowerShare Mail Server message queues, there is no way to access messages that are located in personal message queues. This is the same situation as with Visitor Mailboxes. Remote users can gain access to any messages that are delivered to a PowerShare Mail Server or through a server based Mail Service Access Module. Any messages that are delivered to local message queues (Direct Dialup mail, Direct AppleTalk mail and personal Mail Service Access Modules) cannot be accessed remotely.

AOCE: AppleMail (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: AppleMail (10/93)

==========

Article Created: 4 October 1993

TOPIC ----------

This article describes AppleMail in Apple Open Collaborative Environment (AOCE).

DISCUSSION ----------

PowerTalk will ship with a letter application called AppleMail. This application allows users to create, edit, address, read, and send letters.

AppleMail supports Standard Interchange Format which supports styled text, pictures, sound in AIFF format and QuickTime movies.

Users can use an application other than AppleMail to read messages from the In Tray. Because of type and creator conflicts, PowerTalk will not automatically launch an application other than AppleMail. However, users could open mail by dragging messages from the In Tray to a third party letter application that supports Apple Letter format.

Letterheads

AppleMail also supports letterheads.

Users can create new letterheads at any time by saving a document as a letterhead. To use a letterhead, select Letterheads from the File menu.

Letterheads are stored in a folder inside the Preferences folder in the System Folder.

File Format

AppleMail can send letters in two different formats: AppleMail and SnapShot. The SnapShot format is an image format, suitable for sending to a destination that does not understand AppleMail format, such as a FAX machine. It is possible to send a letter in both formats simultaneously

by checking the 'Multiple Formats' box. This option is useful in situations where the user sending the letter does not know if the user at the destination has the application necessary to open and read the letter.

Signing A Letter

AppleMail also fully supports the digital signatures capability of AOCE. Letters are signed by checking the 'Sign' box in the Send dialog box. PowerTalk will either use the signer file named in the Digital Signatures Prefs file or prompt the user to select a signer file.

The signed letter is then sent to its destination. Once the destination receives the letter, the signature can be verified by clicking the button in the mailer.

Letter Priority

The Send dialog box also allows the user to set a message priority. Message priority is a type of tag that can be used to sort messages in the In Tray using the View menu. Setting a message priority does not do anything different as far as how the message is actually delivered.

AOCE: Authentication and Privacy Services Overview (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: Authentication and Privacy Services Overview (10/93)

==========

Article Created: 4 October 1993

TOPIC -----

This article provides an overview of Authentication and Privacy Services of Apple Open Collaborative Environment (AOCE).

DISCUSSION -----

PowerShare provides authentication and privacy features for users in a server-based environment. Through AOCE's two way authentication service, users and applications can be confident that the network entity with whom they are communicating are who they claim to be. The privacy feature of AOCE refers to a new protocol, AppleTalk Secure Data Stream Protocol (ASDSP) which encrypts data traveling across the wire.

Two Way Authentication

Two way authentication means that both sides are authenticated to each other. To illustrate why this is important, imagine a network application which prompts a user for a password. The user enters the password, thereby authenticating the user to the application. However, the application has not been authenticated to the user. It is possible that there is a password-gathering application loose on the network which, by impersonating a legitimate application, gathers user names and passwords. This situation is an example of one way authentication.

Two way authentication means that both parties are authenticated to each other. There is a mechanism by which each side can be assured that the entity with whom they are communicating is who it claims to be.

Authentication vs. Authorization

AppleTalk Secure Data Stream Protocol (ASDSP) only offers authentication services, not authorization. Authentication answers the questions 'Who am I?' and 'Who am I talking to?,' while authorization answers the questions 'Do I have access to this server?' and 'What are my access

privileges?' ASDSP leaves authorization services up to the individual application.

ASDSP

Some customers are concerned about someone tapping into their physical network with a packet analysis tool and gathering confidential information by reading the packets on the network. Before AOCE, there was no way for customers to protect against wire tapping, other than guarding the physical security of their network.

PowerShare offers protection against wire tapping through the use of a new protocol, AppleTalk Secure Data Stream Protocol (ASDSP). ASDSP is a secure version of AppleTalk Data Stream Protocol (ADSP). ASDSP encrypts the packets traveling across the wire. If a wire tapper does tap into the network, the packets gathered will be encrypted.

ASDSP uses RC4 encryption.

AOCE: Catalog Service Access Modules (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: Catalog Service Access Modules (10/93)

==========

Article Created: 4 October 1993

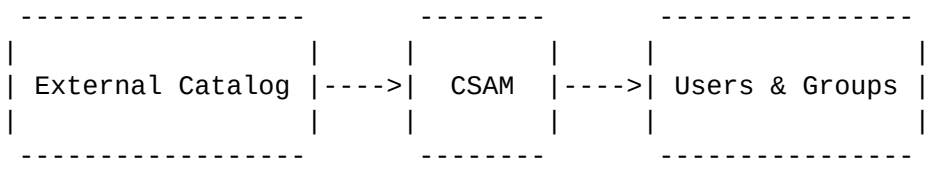
TOPIC --

This article describes Catalog Service Access Modules of Apple Open Collaborative Environment (AOCE).

DISCUSSION --

Catalog Service Access Modules (CSAMs) provide PowerTalk users with access to external sources of information. Examples include an X.500 directory service, a list of network entities on an AppleTalk network, or a window into a foreign file system.

Catalogs accessed through a Catalog Service Access Module are taking advantage of AOCE's open architecture which provides users the ability to use a wide variety of catalog services. Catalog Access Modules are responsible for translating external catalog information, in whatever form it may exist, into something which AOCE can display in the Catalogs icon.



Role of Catalog Service Access Module

Catalog Service Access Modules reside on the local workstation. In the initial release of AOCE software, server based Catalog Service Access Modules are not supported.

AOCE: Catalog Services Brief Description (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: Catalog Services Brief Description (10/93)

==========

Article Created: 4 October 1993

TOPIC --

This article provides a brief description of Catalog Services in Apple Open Collaborative Environment (AOCE).

DISCUSSION --

One possible use of catalog services is a directory service of electronic mail addresses. However, PowerTalk catalogs can provide much more information than simple lists of names. Through either the PowerShare Catalog Server or through Catalog Service Access Modules, PowerTalk users can access data in any format from text to sound to images. Catalog services go far beyond simple lists of names.

PowerTalk provides a new icon on the desktop, the Catalogs icon, through which users can browse a variety of catalog services.

In addition, users can place personal catalogs on their local workstation. Personal catalogs can be placed in the Apple menu or in any other location on a local or shared drive.

AOCE: Certificate Sets Part Of The Digital Signature (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: Certificate Sets Part Of The Digital Signature (10/93)

==========

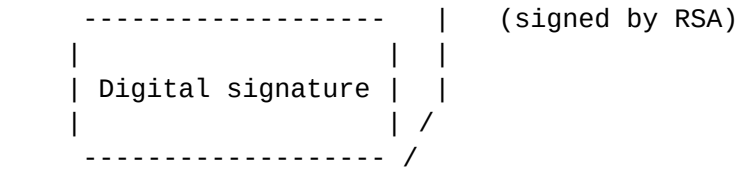
Article Created: 4 October 1993

TOPIC --

The certificate set is part of what is attached to data that has been signed. The public key certificate contains the signer's public key, signed by the issuing organization.

DISCUSSION --

A certificate set contains a complete chain of signed certificates. In this example, Joe's public key certificate is signed by Apple. The digital signature portion of Joe's signed certificate consists of a digest of Joe's public key certificate signed by Apple. That means the digest is encrypted with Apple's private key. The encrypted digest is decrypted by using Apple's public key which is the next certificate in the chain. Apple's signed certificate follows Joe's certificate. Apple's signed certificate is constructed in the same way: a public key certificate containing Apple's public key and various other identifying information followed by an encrypted digest of the public key certificate signed by RSA.



Certificate Set

There is no certificate for RSA because everyone knows RSA's public key. RSA's public key is installed into a user's Macintosh with AOCE.

To validate something signed by Joe, Apple's public key is taken from Joe's certificate set and used to decrypt the digest of Joe's public key certificate. The decrypted digest is then compared with a new digest of Joe's public key. In turn, Apple's signature is verified by using RSA's public key to decrypt the digest of Apple's public key certificate and then the digests are compared. Finally, Joe's public key is applied to the encrypted digest of the data being signed. The result is compared with a newly calculated digest of the data. If they match, the signature is validated.

If any of the above steps fails the signature will not verify.

AOCE: Date & Time Control Panel (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: Date & Time Control Panel (10/93)

==========

Article Created: 4 October 1993

TOPIC --------------------

This article describes the function of the Date & Time Control Panel in Apple Open Collaborative Environment (AOCE) and it's importance for proper operation.

DISCUSSION --------------------

Many features of AOCE technology rely upon the date and time being correct. PowerTalk includes a new Date & Time control panel for setting the correct date, time and time zone. If any of these are incorrect, users may experience problems with accessing their PowerShare servers. Mail messages will also have the wrong date attached to them.

To set the date and time, open the Date & Time control panel, and check that the information is correct. Set the proper time zone by selecting a city located in the same time zone as the Macintosh computer.

Troubleshooting

One common user problem with PowerTalk or PowerShare is getting the date, time, or year wrong. If nothing is working, always check the Date & Time control panel for the correct information, including the correct year. If the system clock has been reset to 1904, AOCE services will not work.

AOCE: Direct AppleTalk Mail (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: Direct AppleTalk Mail (10/93)

==========

Article Created: 4 October 1993

TOPIC -----

This article describes Direct AppleTalk Mail on Apple Open Collaborative Environment (AOCE).

DISCUSSION -----

AOCE software will ship with Direct AppleTalk mail, an example of a Catalog Service Access Module.

The AppleTalk catalog displays Macintosh computers which have an AOCE Toolbox installed. A PowerTalk user would use this catalog to address messages to a particular Macintosh computer, allowing users to exchange messages in a server-less environment.

The entries in the AppleTalk catalog display the machine name of each Macintosh computer, taken from the Sharing Setup control panel.

AppleShare Servers

The AppleTalk catalog also displays AppleShare servers on the network. Users can select an AppleShare server from the AppleTalk Catalog and place a key to that file server in the PowerTalk Key Chain.

This provides easy access to networking services without requiring the user to remember separate user names and passwords for many different servers. Access to servers is still protected by the PowerTalk Key Chain access code.

AOCE: How ASDSP Encrypts (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: How ASDSP Encrypts (10/93)

==========

Article Created: 4 October 1993

TOPIC --

This article describes how AppleTalk Secure Data Stream Protocol (ASDSP) Encrypts in Apple Open Collaborative Environment (AOCE).

DISCUSSION --

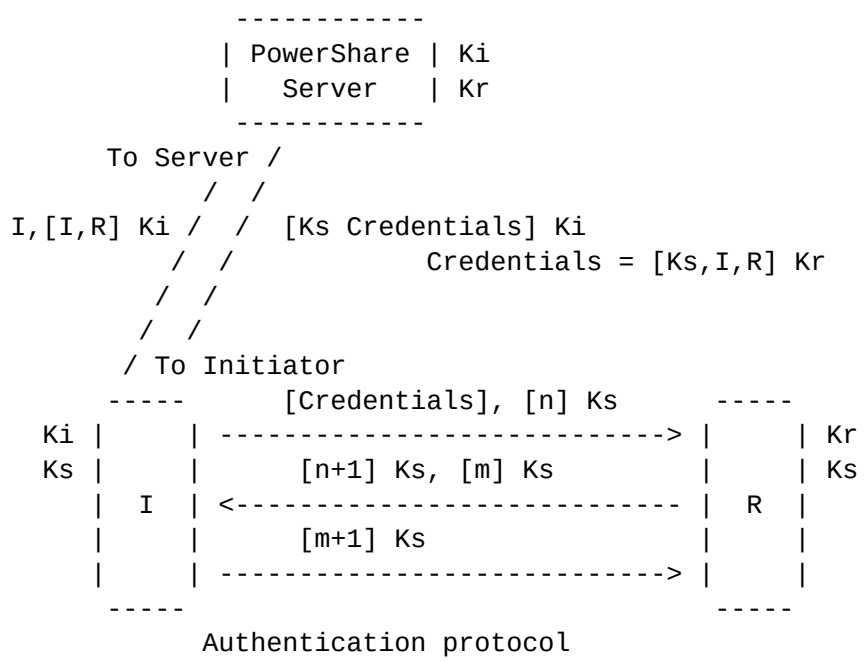
The authentication process in AOCE technology relies on a trusted authority, the PowerShare Catalog Server, to authenticate two parties to each other. Each entity on the network trusts the server to authenticate other entities on the network.

The PowerShare Catalog Server can provide these authentication services because everyone has a PowerShare account. The server converts the user's password into a key that is used to encrypt information.

A Walk Through the Protocol

Suppose "I", the Initiator, wants to talk to "R", the Recipient. There is also a PowerShare Catalog on the network. At the beginning of the process, the Initiator knows the Initiator's key, Ki, the Recipient knows the Recipient key, Kr, and the PowerShare Catalog knows both their keys.

The process begins with the Initiator sending a request to the PowerShare Catalog asking for a set of credentials to use in establishing a secure session with the Recipient. This request contains who the Initiator is and who the intended Recipient is, encrypted with the Initiator's key, Ki. The encrypted information is accompanied by a clear text statement of who the Initiator is so the catalog knows which key to use to decrypt the request. The PowerShare Catalog Servers serving that catalog folder are the only entities on the network, besides the Initiator, which can decrypt the credential request.



Authentication protocol

Once the PowerShare Catalog Server decrypts the credential request, the server sends the Initiator a set of credentials along with a session key, Ks. The session key will be used to encrypt communication between the Initiator and the Recipient. The packet returned by the PowerShare Catalog Server is encrypted with Ki, the Initiator's key. The only entity on the network that can decrypt this packet, besides the PowerShare Catalog Server, is the Initiator. Once the Initiator decrypts this packet, using Ki, the Initiator knows both its own key, Ki, and the session key, Ks.

The next step is for the Initiator to begin to send the Recipient the credentials package in order to authenticate the Initiator to the Recipient. The Initiator cannot decrypt the credentials package because the information in the credentials package is encrypted with Kr, the Recipient's key. The Initiator sends the credentials package to the Recipient who then decrypts it. The credentials package contains the session key, Ks, the Initiator's identity, and the Recipient's identity. The Recipient now has the session key.

The next portion of the authentication process is the challenge exchange. This is to prevent a wiretapper from capturing packets on the network and then replaying them later in order to establish a false session.

Along with the credentials package, the Initiator sends a random number, n, encrypted with the session key. Once the Recipient successfully decrypts the credentials and has the session key, the Recipient will be able to decrypt the random number n. The Recipient adds one to the random number n, encrypts the result with the session key, and sends it to the Initiator. At the same time, the Recipient picks its own random number, m, encrypts it with the session key, and sends it to the Initiator.

The Initiator decrypts the n+1 package sent by the Recipient and confirms that it is indeed the original random number n, +1. The Initiator then decrypts the Recipient's random number m, adds one to it, encrypts it with

the session key, and returns it to the Recipient. The Recipient confirms that what it receives really is m+1.

At this point, a secure session has been established. The Initiator and Recipient can use the session key to encrypt data traveling between them using ASDSP.

What This Means

The session key can be valid for up to eight hours. After that period, a new key must be negotiated. The process of session key negotiation is transparent to the user. An application using ASDSP can specify the time period for which the session key will be used.

The Initiator and Recipient must have accounts in the same PowerShare Catalog, though not on the same server or in the same catalog folder.

Import/Export Restrictions

Apple has a license to export all AOCE technology from the United States. At this date, there is a problem with importing the technology into France. To address this issue, there will be two versions of AOCE software available: encrypted and encryption-free. The encryption-free version will be shipped in France and any other country where importing AOCE technology becomes an issue.

If both sides are using the software that allows encryption, the session is encrypted. Otherwise, the session is not encrypted.

AOCE: The I'm At Feature and PowerBook (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: The "I'm At" Feature and PowerBook (10/93)

==========

Article Created: 4 October 1993

TOPIC --------------------

This article describes the benefits of the "I'm At" feature of Apple Open Collaborative Environment (AOCE) and how it assists PowerBook users.

DISCUSSION --------------------

The "I'm At" feature of PowerTalk allows users to store several configurations for their AOCE client systems. The options are work, home, on the road, or off-line. This option is particularly useful for PowerBook users.

A PowerTalk user will probably have access to different services depending on the Macintosh computer's location, at home, work, or on the road. For example, a user may want to disable Direct Dialup mail unless the Macintosh computer is at home. Similarly, if the user is at home, some work related catalogs might not be available.

Working off-line means the user will be able to create and send messages, but no attempt will be made to deliver the messages until the user indicates that a network is now connected. This selection is most useful in situations where the Macintosh computer is not connected to any network or communications methods.

PowerBook users will find the "I'm at" feature to be especially useful. It allows them to store several different preset configurations for collaboration services. One menu selection quickly enables or disables the appropriate services.

AOCE: Regulatory Issues With Encryption Import/Export (3/96)

Revised: 4/1/96
Security: Everyone

AOCE: Regulatory Issues With Encryption Import/Export (3/96)

==========

Article Created: 4 October 1993
Article Reviewed/Updated: 29 March 1996

TOPIC ----------

Are there any import/export problems with AOCE technology?

DISCUSSION ----------

Apple has received the necessary licenses from the United States government to export AOCE technology. However, there are problems with importing AOCE technology into France and its colonies and territories. The French government puts many restrictions on importing of software which does any kind of encryption. Since PowerShare does encryption with ASDSP, Apple will not be able to import AOCE products with encryption into France.

As a result of this restriction, Apple will be shipping an encryption-free version (PowerTalk Lite) in France. This version will not support ASDSP or authentication.

PowerShare Catalogs must either all support encryption or all not support encryption. If only one PowerShare Catalog Server in an PowerShare Catalog does not support encryption, then there will be no ASDSP or authentication services available.

AOCE: Information Cards (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: Information Cards (10/93)

==========

Article Created: 4 October 1993

TOPIC ----------

This article describes Information Cards of Apple Open Collaborative Environment (AOCE).

DISCUSSION ----------

An information card is a file that contains the contents of one catalog record. Information cards are created by dragging a catalog record to the desktop or to someplace other than another catalog window. They can also be created from within a catalog using the Catalogs menu. Once an information card has been created, it can be used in the same way as the original catalog entry.

Information cards can be used for drag and drop mailing or for dropping information to a catalog entry. A user could create an information card for a frequently used mail address. Putting the information card on the desktop allows the user to easily mail files and folders by dropping them onto the information card.

Because information cards are portable, they can also be distributed as enclosures in mail messages or put onto a floppy disk.

Information cards can be created from any catalog record, including those found in PowerShare Catalogs, the AppleTalk catalog or personal catalogs.

AOCE: Mail Service Access Modules (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: Mail Service Access Modules (10/93)

==========

Article Created: 4 October 1993

TOPIC -----

This article describes the Mail Service Access Modules of Apple Open Collaborative Environment (AOCE).

DISCUSSION -----

Just as Catalog Service Access Modules provide access to external catalog services, Mail Service Access Modules provide access to messaging services. With the appropriate Mail Service Access Module, a PowerTalk user will be able to exchange messages with users on a variety of platforms and message delivery systems. Mail Service Access Modules will be provided by third parties.

At the time PowerTalk ships, some of the Mail Service Access Modules that will be available are: SMTP, Microsoft Mail, FAX, voice mail, QuickMail, and pager. This is partial list with many other MSAMs under development and available shortly after product ship.

There are two different types of Mail Service Access Modules: personal and server-based. A personal Mail Service Access Module resides on the local user's workstation. A server-based Mail Service Access Module resides on a PowerShare Mail Server. Letters sent through the server-based Mail Service Access Module are sent first to the PowerShare server and then out through the Mail Service Access Module.

This is a different situation from Catalog Service Access Modules where Catalog Service Access Modules could reside only on the local workstation.

AOCE: Mailbox (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: Mailbox (10/93)

==========

Article Created: 4 October 1993

TOPIC ----------

This article describes the Mailbox of Apple Open Collaborative Environment (AOCE).

DISCUSSION ----------

PowerTalk puts a new icon on the desktop for the Mailbox.

The icon represents an In Tray since this is where all incoming mail arrives, no matter what the original source. Messages in the mailbox can be in a variety of formats.

When the In Tray is open, the Mailbox menu is added to the menu bar. The Mailbox menu includes several selections for users to administer their incoming and outgoing mail.

Mailbox menu contains the following options:
  In Tray
  Out Tray
  Tag...
  Copy Local...
  Preferences

• Out Tray
  The Out Tray displays items that either have been sent recently or are waiting to be sent.

  A copy of a sent letter will remain in the local system's outgoing letter queue until either the user drags it to the Trash or until the timeout period expires. Letters stay in the Out Tray for a period of time after they are sent to allow users to access recently sent letters. The default time for letters to remain in the Out Tray after being sent

is 14 days. This time period can be configured using the PowerTalk Setup control panel.

If the letter was sent through a server, the letter is resident on the server queue. If the letter was sent through server-less messaging, the letter remains on the local system until the Out Tray timeout period has expired. In either case, the user will see the letter in the Out Tray.

- Copy Local
  Copy Local means to take the selected letters and copy them from a server based letter queue to the local letter queue. This is another feature to make it easier for PowerBook users to collaborate remotely.

- Mailbox Preferences
  The Preferences menu selection provides the following choices:
  - Mail Tray:
    Show most recent first
    Allow Visitor's mailbox
  - When Mail Arrives:
    Display alert
    Blink icon in menu bar
    Play this sound:
  - Out Tray Aging
    Remove processed items after XX days.
  - Tags List:
    Edit (button)

  If visitor's mailboxes are allowed, then someone else will be able to use this Macintosh computer to retrieve mail stored on a PowerShare Mail Server. Visitor mailboxes allow the user to have multiple mailboxes open on the desktop.

- Tags
  Tags can be added to letters in the In Tray. Tags are useful in filtering incoming letters. The View menu can be used to restrict the view of letters in the In Tray to only show letters with a given tag.

  Tags are assigned to letters using the Tag menu item. To assign a tag, select the item(s) in the In Tray and then select Tag from the Mailbox menu. Tags can also be assigned form within AppleMail.

  To see a list of tags already created, press the pop up arrow button. Create a new tag by typing it into the dialog box and clicking the Add button from the Tag window.

  The tags attached to a letter can be seen through the Get Info dialog box. Select the letter from the In Tray and then select Get Info from the File menu.

  Tags can also be used by Beyond Software's MacRules Pro application. MacRules Pro can create rules to automatically add or delete tags or to take certain actions based on tags assigned to letters.

Tags can be single words or a short phrase.

Tags are removed when the item is moved from the In Tray to the local hard drive.

AOCE Mailer (10/93)

Revised: 9/30/93
Security: Everyone

AOCE Mailer (10/93)

==========

Article Created: 4 October 1993

TOPIC -----

This article describes the Mailer in Apple Open Collaborative Environment (AOCE).

DISCUSSION -----

The top portion of AppleMail contains the Mailer.

Apple is encouraging developers to incorporate the AOCE Mailer into their applications. Once the mailer is a standard part of a Macintosh application, sending messages from within an application will become as commonplace as printing is today.

Developer University has completed a course on adding the AOCE Mailer to applications. Because the process requires very little effort on the part of developers while at the same time adding significant functionality to the application, it is expected that most Macintosh developers will be incorporating the AOCE Mailer into their products.

There are applications where it would not be appropriate to include the entire Mailer. In these cases, developers can access the mail and messaging services of AOCE using the Mail Manager calls directly instead of using the standard Mailer.

- From...
  The 'from' field defaults to the owner of this AOCE system.

- Recipients...
  Letters are addressed using the Catalog Browser Panel. Click the Recipients button to display the Catalog Browser Panel.

  Personal Catalog
    Letters can be addressed by selecting the address from the list of

potential addresses and clicking either the To button or the CC: button. The top icon displays the contents of the preferred Personal Catalog.

Catalog Browser
The second icon shifts the display to the Catalogs icon. This will look inside the Catalogs icon on the desktop. Users can also use the pop-up menu at top to browse through the file system for other personal catalogs or information cards.

Find Address
The third icon is used for finding addresses. Users can search for addresses located in a particular catalog or on any mounted volume.

Type in addressing
The last icon allows users to type in an address. This is useful when the user knows the destination address yet there is no catalog service available to use in addressing the letter. One common example might be an Internet address or other messaging system that does not have a directory service.

- Subject...
  The subject field contains the subject of the letter.

- Enclosures...
  There are two ways to add enclosures with the Mailer. The first is to drag enclosures directly into the enclosures field.

  The second is to click the Enclosures button and use the standard file dialog box to select a file or folder to enclose.

- Finder Support
  PowerTalk is able to support dragging items directly into the enclosures field because of modifications to the Finder. PowerTalk incorporates a new Finder with changes made for AppleScript, AOCE, and QuickDraw GX.

  It is also possible to drag information cards or addresses from Catalog windows into the Recipients field to address a letter.

  The drag and drop method of addressing letters or adding enclosures is a feature of the System 7 with PowerTalk. It works no matter which application, third party or Apple, is in use.

AOCE: Message Delivery Methods (11/93)

Revised: 11/30/93
Security: Everyone

AOCE: Message Delivery Methods (11/93)

==========

Article Created: 4 October 1993
Article Reviewed/Updated: 30 November 1993

TOPIC ----------

This article describes the Message Delivery Methods of Apple Open Collaborative Environment (AOCE).

DISCUSSION ----------

PowerTalk itself can exchange messages using three different message delivery methods.

- Direct AppleTalk mail
- PowerShare Server mail
- Direct Dialup mail

Additional message delivery methods can be added using Mail Service Access modules from third parties.

Direct AppleTalk Mail

Direct AppleTalk mail enables users to exchange letters across an AppleTalk network without the use of a server. PowerShare is not required to take advantage of Direct AppleTalk mail. Direct AppleTalk mail is part of the PowerTalk package.

Within the AppleTalk Catalog, Macintosh computers with an AOCE toolbox installed appear as Direct AppleTalk mail addresses in the Catalogs window. A PowerTalk user could use this address to send messages to any Macintosh that appears in the AppleTalk Catalog window.

PowerShare Mail Server based messaging

Apple will be marketing a PowerShare Mail Server for users who want the advantages of a server-based mail system. With a PowerShare Mail Server,

users will be able to use Visitor Mailboxes to retrieve server-based mail from remote locations. PowerShare also gives users additional privacy and security features with over the wire encryption and authenticated connections.

Direct Dialup Mail

Direct Dialup mail is the ability of two Macintosh computers to call each other and exchange messages through a modem. This allows users who are connected by telephone to exchange messages with other PowerTalk users.

Dialup and AppleTalk Remote Access (ARA)

ARA 2.0 and Direct Dialup mail use the same modem connection scripts and low level drivers. They also are compatible with each other. If a call comes in, ARA and PowerTalk will negotiate to determine whether the call is for ARA or Direct Dialup mail. However, Direct Dialup mail is not the same thing as ARA.

Direct Dialup mail is not a way to retrieve PowerTalk letters from a remote location.

There is no way to use Direct Dialup mail or ARA to retrieve messages stored in a local message queue. Examples include messages delivered to a Direct AppleTalk mail address.

- IMPORTANT: Direct Dialup mail will not be a part of the initial release of PowerTalk, Direct Dialup may be obtain separately. To get Direct Dialup mail the request card which comes with System 7 Pro along with the amount of money specified. Direct Dialup mail may be fully incorporated into a later release of PowerTalk.

Server Based Dialup

PowerShare does not support server based dial up in the initial release. Two PowerShare Mail Servers will not call each other to exchange messages.

Article Change History:
30 Nov 1993 - Updated article for ARA 2.0 release.

AOCE: Messaging Services (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: Messaging Services (10/93)

==========

Article Created: 4 October 1993

TOPIC --------------------

This article describes the Messaging Services of Apple Open Collaborative Environment (AOCE).

DISCUSSION --------------------

The most obvious use of messaging services is electronic mail, exchanging letters and documents between two end users. However, electronic mail is just one example of the possible messaging services offered by AOCE technology.

- IPM
  AOCE software supports InterProgram Messaging (IPM) a way of sending messages between applications as well as between electronic mail users. IPM is different from InterProgram Communication (IPC) in that IPM messages are delivered in a store and forward manner and that they can be addressed to a group of addresses. IPC messages must be delivered in real time and can have only one destination per message.

- Mail vs. messaging
  The AOCE toolbox distinguishes between electronic mail and other AOCE messages through the use of message families. Any message of family 'file' or 'mail' will be treated as an electronic mail message and delivered to the System Mailbox. Messages of the 'file' family are direct display files, meaning that the file can be displayed as an image without any application software required.

  The AOCE toolbox does no special handling for messages of different families. All messages, whether destined for the system mailbox or another application, are delivered in the same manner.

- Store and forward messaging
  All AOCE messages are delivered in a store and forward manner. When a

message is created on an AOCE system, the message is placed in an outgoing queue and delivered when the destination is available. Once the message has been placed in the outgoing message queue, the message originator need not worry about checking to see when the destination is available. The AOCE Toolbox will attempt to contact the destination and deliver the message.

In a server-based environment, messages are delivered to the server and then to their eventual destination. In a server-less environment, messages remain in the local outgoing message queue until they are delivered.

There is a timeout period associated with message delivery. If an AOCE system is unable to deliver a message for 5 days, a problem report will be sent to the message originator informing them that the message could not be delivered. The 5 day period was chosen to take into account situations where a message could not be delivered because the destination was unavailable over a 3 day weekend.

The 5 day timeout period is not user modifiable in the initial release of PowerTalk and PowerShare.

All AOCE users gain the benefit of store and forward messaging, whether they are in a server-based or server-less environment.

AOCE: Personal Catalogs (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: Personal Catalogs (10/93)

==========

Article Created: 4 October 1993

TOPIC --------------------

This article describes Personal Catalogs of Apple Open Collaborative Environment (AOCE).

DISCUSSION --------------------

There are times when users may find it more convenient to store catalog items locally instead of on a server. For this situation, PowerTalk includes personal catalogs. A personal catalog can contain any record that can be stored in an PowerShare Catalog Server or available through a Catalog Service Access Module. Users can also create new records specifically for a personal catalog.

When PowerTalk is installed, one personal catalog is created and placed in the Apple menu. Users can have more than one personal catalog on a workstation. Personal catalogs can be stored on any volume.

Personal catalogs could be used to gather collections of similar records. For example, one personal catalog could contain the addresses of everyone associated with a particular project. Another personal catalog could be an index to a music collection. Personal catalogs can hold the same types of information as a regular PowerShare Catalog with the advantage that users can create and edit personal catalogs at will.

Unlike PowerShare Catalog Server catalogs or catalog services accessible through a Catalog Service Access Module which have a hierarchical structure, personal catalogs have a flat structure. They are simple collections of records.

Personal catalogs, like other AOCE Catalogs, support collections of user records called groups. To create a group, use the 'Create Group' menu item. To add items to a group, drag the record from the personal catalog into the group's folder.

To add a record to a personal catalog from a PowerShare Catalog or other Catalog service, drag the PowerShare Catalog entry into the personal catalog window. Data stored in the catalog record will be copied to the personal catalog.

There is no automatic synchronization of records in a personal catalog with the corresponding records in a PowerShare Catalog. To avoid synchronization problems, it is possible to create aliases to the PowerShare Catalog record and place the aliases into the PowerShare Catalog. The disadvantage of this approach is that the record is no longer available if the system cannot communicate with the PowerShare Catalog. PowerBook users, especially, should avoid this approach.

Personal catalogs can also contain aliases to the original records. Personal catalogs cannot contain other personal catalogs.

Creating New personal catalogs

To create a new personal catalog, open the Catalogs windows and select 'New Personal Catalog' from the Catalogs menu. There is no limit on the number of personal catalogs a user can access. However, the preferred Personal Catalog comes up automatically in the Catalog Addressing Panel. Select which personal catalog is the preferred Personal Catalog by using the Get Info window.

AOCE: PowerTalk Setup Control Panel (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: PowerTalk Setup Control Panel (10/93)

==========

Article Created: 4 October 1993

TOPIC ----------

This article describes the PowerTalk Setup Control Panel and Visitor Mailboxes of Apple Open Collaborative Environment (AOCE).

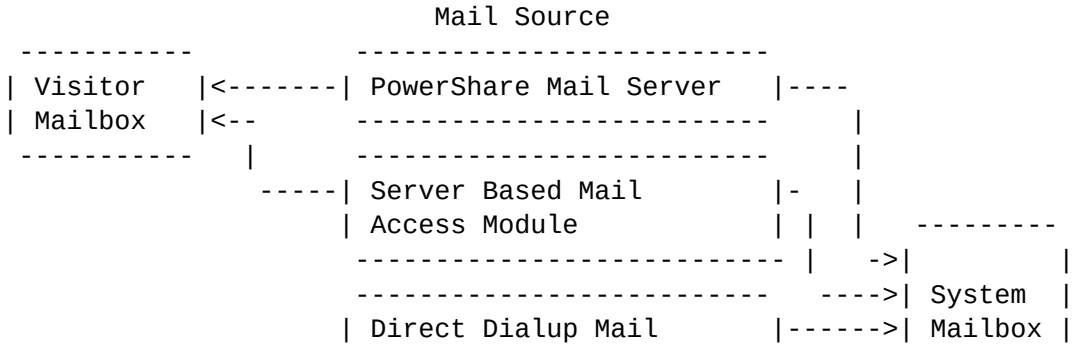
DISCUSSION ----------

Functionality for adding and removing different messaging and catalog services has been moved to the PowerTalk Key Chain.

There is now a user adjustable time-out period. If the system is idle for a given amount of time, the user will be prompted to enter a password to access collaboration services. This is useful in the situation where someone walks away from their desk, leaving their Macintosh computer unattended.

Visitor Mailboxes

There are situations where a user might want to retrieve their mail from somewhere other than their usual workstation. There are also situations where one user may want to have mailboxes for multiple PowerShare accounts simultaneously open on the desktop. To handle these situations, PowerTalk provides Visitor Mailboxes.



What is accessible from which mailbox

Visitor Mailboxes contain any messages that come from a PowerShare Mail Server. The messages can be delivered directly through the PowerShare Mail Server or through a server-based Mail Service Access Module. In either case, the messages are delivered to a message queue on a PowerShare Mail Server.

Visitor Mailboxes do not have access to messages delivered to a local message queue. Any messages that are delivered through Direct Dialup mail, Direct AppleTalk mail or through a personal Mail Service Access Module cannot be accessed through a Visitor Mailbox.

By default, Visitor Mailbox capability is turned off in PowerTalk. To enable Visitor Mailboxes, open the System Mailbox and select Preferences from the Mail menu.

Check the box to enable Visitor Mailboxes. Now there will be a new selection in the Special menu for creating a Visitor Mailbox.

When selecting Visitor Mailbox, the user will provide the PowerShare account name, password, and which catalog contains the account.

If the workstation does not know about the PowerShare Catalog containing the account, select Other and PowerTalk will perform a network search to find available PowerShare Catalogs. Once the list is complete, select the PowerShare Catalog containing the user's account.

One PowerTalk workstation can have multiple Visitor Mailboxes open at the same time. Each Visitor Mailbox points to a different server-based message queue.

AOCE: PowerShare Catalog Server Administration (10/93)

==========

Article Created: 4 October 1993

TOPIC -----

This article describes PowerShare Catalog Server Administration of the Apple Open Collaborative Environment (AOCE).

DISCUSSION -----

PowerShare Catalogs are created and maintained using an application called the PowerShare System Manager's Utility. This utility can be run locally or from a remote location. The PowerShare Catalog Servers serving a particular PowerShare Catalog can be physically located in a phone closet or other secure location while administration happens remotely. Remote administration does not create a security breach since all communication between the Admin application and the PowerShare Catalog Server is encrypted with ASDSP. Any packets tapped from the wire would be encrypted.

AOCE: Public Key Cryptography (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: Public Key Cryptography (10/93)

==========

Article Created: 4 October 1993

TOPIC --

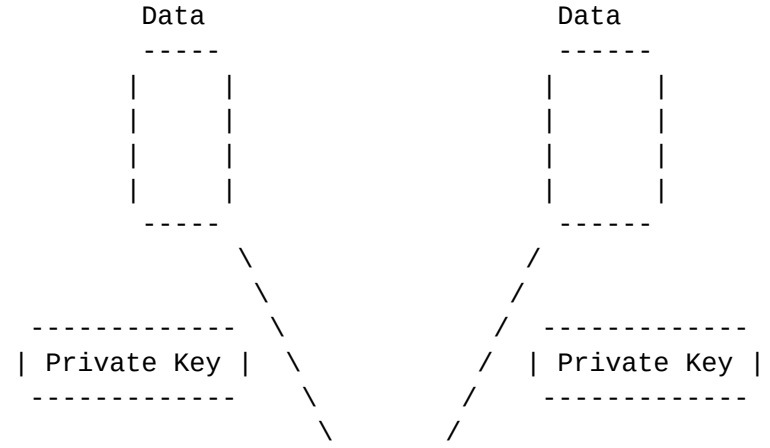
This article describes Public Key Cryptography in Apple Open Collaborative Environment (AOCE).

DISCUSSION --

While the process of signing something does use encryption, the data itself is never encrypted. If digital signatures could be used to encrypt data, Apple would not be able to export the technology. However, digital signatures does use encryption to create the signature.

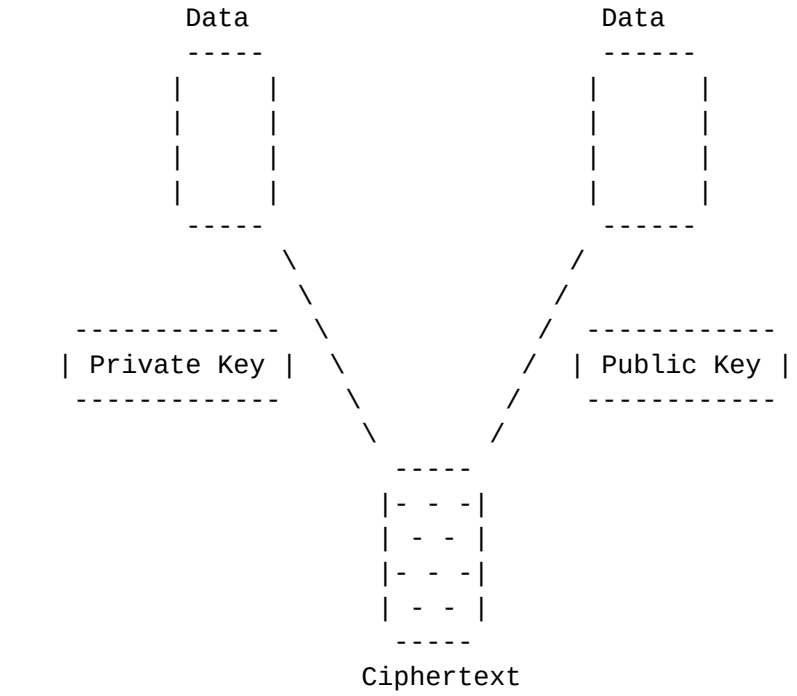
The type of encryption used by digital signatures is called public key cryptography. This is different from the usual private key encryption.

To encrypt something using private key encryption, a private key is used to encrypt the original data and create ciphertext. The same private key is used to decrypt the ciphertext and reproduce the original data. The challenge with private key technology is how to communicate the private key in such a way that it does not become compromised.



Private key cryptography

DigiSign uses something called public key encryption. With public key encryption, a private key is still used to encrypt the original data into ciphertext. This private key remains private, protected by the entity which does the original encryption. Public key technology uses a second public key to decrypt the data. This second key is called a public key because it can be widely distributed. Since both keys are necessary to complete an encrypt/decrypt cycle, only one key need be kept secret.



Public key cryptography

RSA

Apple has licensed digital signature technology from RSA Data Security, Inc. The RSA system has been in use for quite some time. It is the emerging commercial standard of public key encryption systems. By using a standard, Apple ensures that as commercial products using digital signature technology become available on other platforms, Apple will be compatible.

Revised: 9/30/93
Security: Everyone

AOCE: PowerShare Catalog Servers Brief Description (10/93)

==========

Article Created: 4 October 1993

TOPIC --------------------

This article provides a brief description of PowerShare Catalog Servers in Apple Open Collaborative Environment (AOCE).

DISCUSSION --------------------

While the PowerTalk package provides an array of services for customers in a server-less environment, the PowerShare package offers additional features. The PowerShare package contains the PowerShare Catalog Server and the PowerShare Mail Server. The PowerShare Catalog is a hierarchical, distributed repository of information. Putting information on a PowerShare Catalog Server makes that information available to all PowerTalk users and AOCE applications. Information stored in an PowerShare Catalog Server can be of virtually any type.

A PowerShare Catalog contains a number of predefined record types and attribute types. Developers who wish to work with other record types of attribute types can do so by writing an AOCE template. An attribute is the name of the data structure which stores the data in a catalog record. Attributes can have any number of attribute values.

AOCE: PowerShare Catalog Structure (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: PowerShare Catalog Structure (10/93)

==========

Article Created: 4 October 1993

TOPIC -----

This article describes the PowerShare Catalog Structure in Apple Open Collaborative Environment (AOCE).

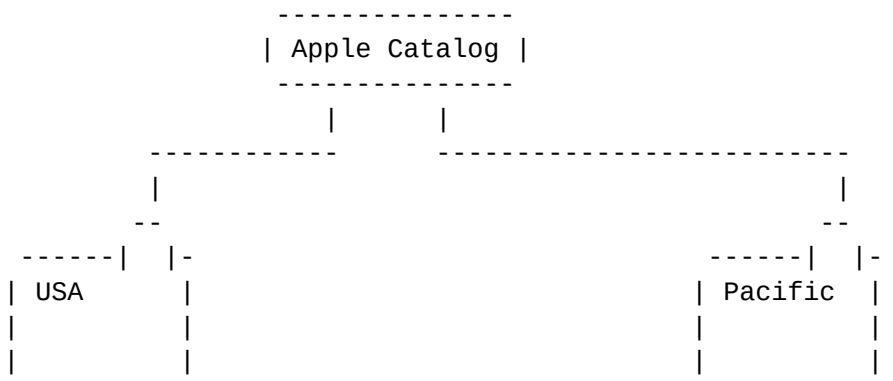
DISCUSSION -----

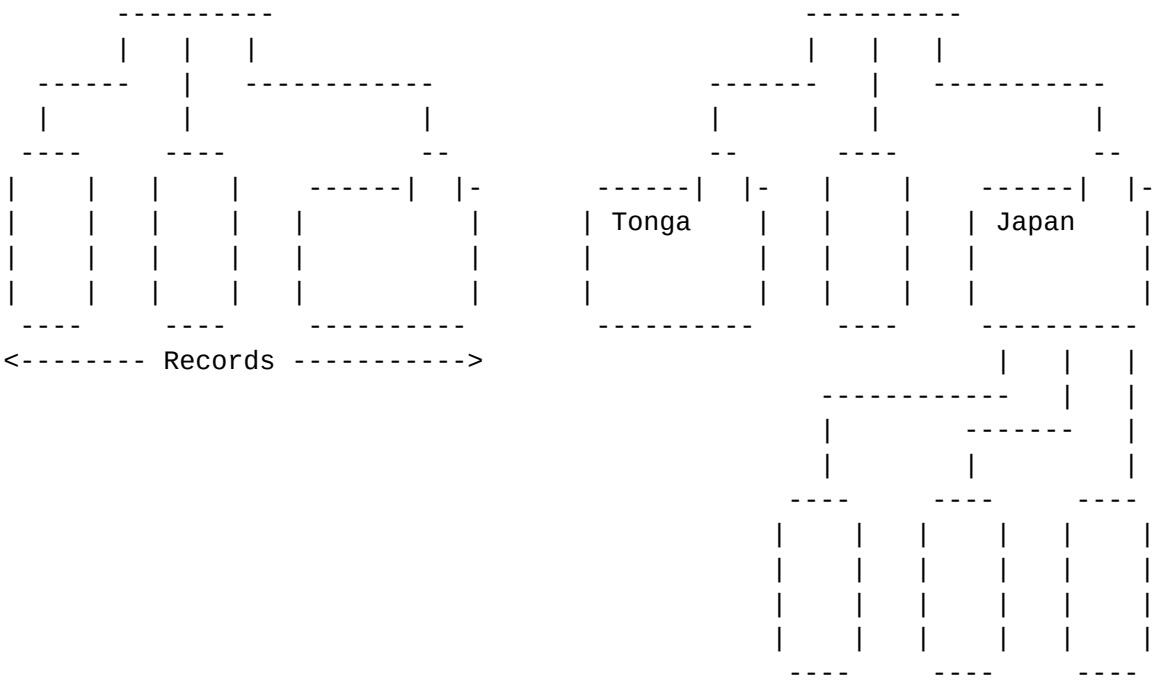
A PowerShare Catalog is a hierarchical, distributed repository of information served by one or more PowerShare Catalog Servers. This catalog also provides authentication services on the network.

The relationship between a PowerShare Catalog and a PowerShare Catalog Server is not necessarily one to one. In fact, in all but the smallest installations, there will be several PowerShare Catalog servers for each PowerShare Catalog.

It is possible for a PowerTalk user to access information from more than one PowerShare Catalog.

- Hierarchical Structure
  An PowerShare Catalog is organized in a hierarchical manner. For example, a PowerShare Catalog could be created for Apple Computer.



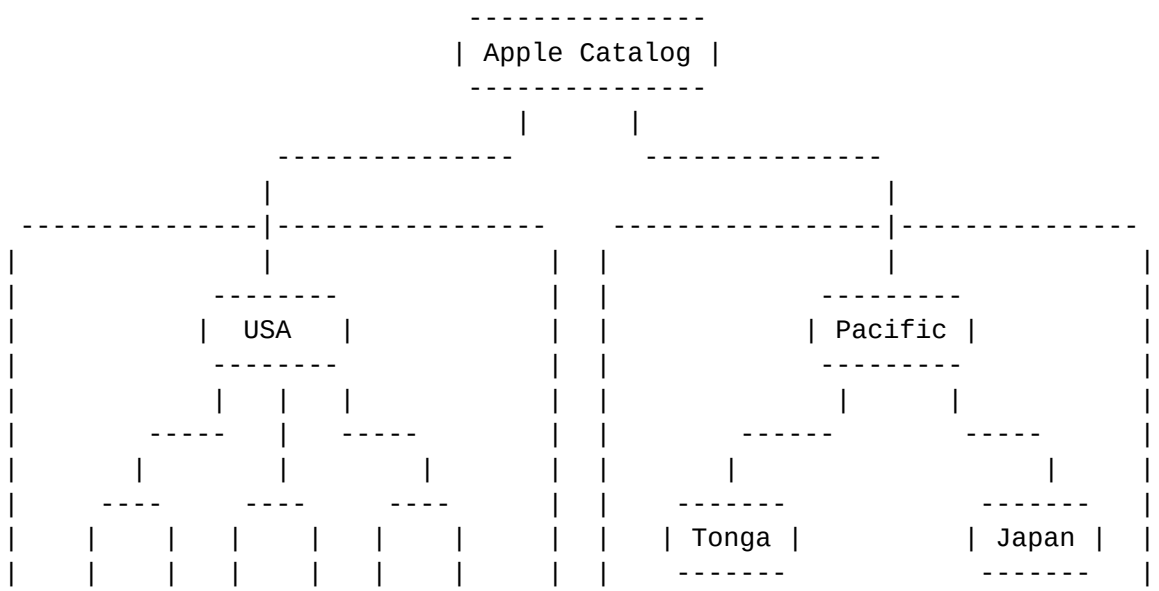


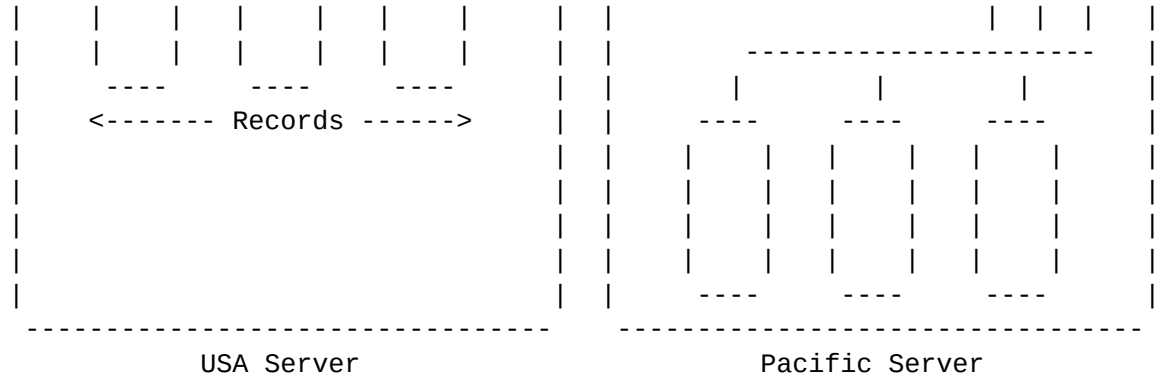
Catalog Structure

Records are stored in catalog folders. It is possible to have a catalog folder that contains both records and other catalog folders.

- Where are the Servers?
  Notice in the above diagram that there are no servers represented. This diagram is a picture of the logical structure of the information in the catalog. The catalog structure does not necessarily indicate which PowerShare Catalog Servers contain which information.

  In this example, it is highly unlikely that the entire Catalog could be maintained on one PowerShare Catalog Server. Instead, the load would be distributed among several PowerShare Catalog Servers. No one server would contain all of the data.





Distributed PowerShare servers

From the AOCE client's perspective, there is no concept of PowerShare Catalog Servers, only PowerShare Catalogs. AOCE clients never select a particular server. In fact, an end user never knows which specific PowerShare Catalog Server is responding to an information request.

In this example, all data for Apple USA resides on the Apple USA server and all data for Apple Pacific resides on the Apple Pacific server. There is no one server that contains all of the records for the entire database. The data is distributed across two servers. However, all the data is in one PowerShare Catalog.

If a user in Apple USA needs information from the Apple Pacific catalog folder, the user need only open the Apple Pacific catalog folder from the Catalogs icon on the desktop. PowerTalk takes care of finding out which PowerShare Catalog Server serves the Apple Pacific catalog folder and directs the information request accordingly. The end user never has to select a PowerShare Server.

- Folders Directory
  PowerTalk keeps a list of which PowerShare servers serve the Folders Directory. The Folders Directory is a copy of the structure of the PowerShare Catalog. The Folders Directory is a type of PowerShare Catalog which is used by PowerTalk and PowerShare to keep track of which servers serve which catalog folders. While the entire Folders Directory might be replicated in several places in a PowerShare system, the Folders Directory does not contain any user data. It contains only path information to direct PowerTalk and PowerShare users to the appropriate PowerShare Servers.

  PowerTalk asks one of the servers serving the Folders Directory which PowerShare servers serve the catalog folder containing the requested data. PowerTalk receives a list of servers serving the appropriate catalog folder. Finally, PowerTalk picks a server from the list and sends the information request.

  This process is transparent to the end user. An AOCE client never sees the different servers. The client only sees different catalog folders. In the Catalogs icon, the end user never knows nor cares which PowerShare Catalog Servers serve which catalog folders.

Replication

If the server containing data for a particular catalog folder goes down, the information in that catalog folder is no longer available. To guard against this situation, two PowerShare Catalog Servers can serve the same catalog folder, replicating the information among themselves.

A replicated server system can also balance the load between several servers, providing quicker responses to client systems. This means more clients can simultaneously access the same catalog folders with no loss of performance.

For example, if Pacific Server #1 would go down for some reason, users would still have access to data in a Apple Pacific catalog folder because Pacific Server #2 also contains a copy of that information.

The end user still sees only the catalog and not the servers. The replication is transparent from the point of view of the AOCE client system.

Replication happens automatically with no intervention required by the catalog administrator. To add a record to a catalog folder, the catalog administrator would run PowerShare Admin to add the new record. As with PowerTalk, the catalog administrator cannot specify which PowerShare Catalog Server will be updated. Instead, the PowerShare System Manager's Utility will add the record to the catalog folder. The PowerShare System Manager's Utility picks one of the PowerShare Catalog Servers that serve that particular catalog folder. That PowerShare Catalog Server takes care of communicating the changes to other PowerShare Catalog Servers that serve the same catalog folder. The catalog administrator only has to update the catalog folder once, instead of updating each and every PowerShare Catalog Server that serves that particular catalog folder.

The PowerShare Catalog Servers keep each other up to date by exchanging updates to information on the catalog folders they serve. The replication mechanism is peer to peer based, not master-slave based. Any server can accept and distribute updates to other servers serving the same directory folders. If one PowerShare Catalog Server receives an update, that server propagates the new information to other PowerShare Catalog Servers that serve the same catalog folder.

While it is true that the servers communicate with each other to check for new information, this exchange does not cause an excessive increase in network traffic. There are two reasons for this. The first is that the servers only exchange information on updates. They do not automatically exchange the entire contents of a catalog folder. The second reason is that the frequency with which the servers check with each other for new information is proportional to the rate of new information. If a large number of updates have been made recently, the servers will communicate frequently. As the amount of new information drops off, the servers drop the frequency with which they communicate with each other. The amount of network traffic generated by PowerShare Catalog Servers is directly

proportional to the amount of information changing in the PowerShare Catalog structure.

AOCE: Are Messages Between Client and Server Encrypted (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: Are Messages Between Client and Server Encrypted (10/93)

==========

Article Created: 4 October 1993

TOPIC -----

Are E-Mail messages sent from a client to the message server, and then from the message server to the recipient client, encrypted using ASDSP? How is the mutual authentication between clients handled?

DISCUSSION -----

In a server-based environment, all communication between client and server is encrypted using ASDSP. If it's a server-less environment, there is no authentication or ASDSP. If the mail is being sent using Direct AppleTalk Mail, the message will not be encrypted, even if there is a server on the network. If two PowerTalk systems want to send messages between each other from within an application, that can be encrypted or not, depending on whether the application knows to call ASDSP instead of ADSP.

AOCE: Where is the RSA Key Pair Created (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: Where is the RSA Key Pair Created (10/93)

==========

Article Created: 4 October 1993

TOPIC -----

Is the RSA key pair created on the client, or at the Certifying Authority?

DISCUSSION -----

The private key is created using the DigiSign Utility on the client system. A key request is sent to the Certifying Authority (RSA, usually) who uses the request (based on the private key created on the client) to create a corresponding public key. This is placed in a signer approval file & sent back to the client. The user then uses the DigiSign Utility on the client system to merge the signer approval file with the private key and create a signer containing both key pairs.

AOCE: Support Issues Q & A (2/95)

Revised: 2/8/95
Security: Everyone

AOCE: Support Issues Q & A (2/95)

==========

Article Created: 4 October 1993
Article Reviewed/Updated: 8 February 1995

TOPIC ----------

This article contains support issue related questions and answers about the Apple Open Collaborative Environment (AOCE).

DISCUSSION ----------

Q) After I installed System 7 Pro, my Macintosh at startup is slower than before. Does it take so long because of the network activity of PowerTalk?
A) No, this is normal behavior because of the additional setup required with PowerTalk. It isn't really network related, it happens even if AppleTalk is turned off.

Q) I have forgotten the Access Code to my Key Chain, how do I create a new one?
A) If you have forgotten the Access Code to your Key Chain, or it has become corrupted, throw away the PowerTalk Setup preferences file from the Preferences Folder. If there are items in the mailbox, they show up again the next time the system goes through the startup process, even if the new Key Chain is set to a different name.

Q) What's the difference between a Password and an Access Code?
A) In the documentation there is a distinction between the two. Passwords are used for things like external mail systems, AppleShare file servers, and so on, while Access Code refers only to the PowerTalk Key Chain, which unlocks the other passwords.

Q) Direct AppleTalk doesn't tell you who sent the mail, only the computer's name from the Sharing Setup Control Panel.
A) Here are ways to resolve this:

- Place the user's name in the "Machine Name" field of the Sharing

Setup Control Panel to help identify mail senders.

- Create a new information card for the person; name it anything you want (for example, name it with their name), then drag their AppleTalk Info Card to the new Info Card you just created. Their AppleTalk address is added to the list of electronic addresses in the Info Card you created with a name that makes sense to you.

- Uncheck Direct AppleTalk Mail in the I'm At… dialog box under the Special menu. Mail can then only be sent through connections that are "turned on". If all mail is sent through a server, then the sender's name is included with the mail. If no server is available, then all access to the user's mailbox is disabled. This is handy if the user doesn't want mail dropped in his or her mailbox without user authentication - there is some room for abuse with non-authenticated mail.

Q) Information Cards and Aliases are easily confused. Information Cards for file servers allow access similar to Aliases. What is the difference?
A) Information Cards are not a hot link to a server but rather a document that contains the address of the server along with other user information. Information Cards only work under System 7 Pro, while Aliases work under all versions of System 7.x.

Q) If I threw away my Key Chain, how can I get it back?
A) Click on the Key Chain button in the PowerTalk Setup control panel, a new Key Chain is generated.

Q) How do I make new letterheads?
A) Documents saved as letterhead become new, potential letterheads.

Q) The mailbox Icon should change when there's mail or when there's a problem sending mail. Why isn't it?
A) Indication of mail in the mail box is set in the mail box preferences; the mailbox Icon does not change. The preferences box setting either beeps, flashes an alert, flashes an icon in the upper left corner, and so on.

Q) What do the different Information Card Icons mean for the same person?
A) Information Cards may provide information on a person, Macintosh, or File Server. A person may own all three types of Information Cards, with three different Information Card Icons representing different connections, all of which get information to the same mail box.

Q) What does it take to send and receive mail without a mail server?
A) You need System 7 Pro or System 7.5; it includes everything you need for server-less mail. No PowerShare is required.

Q) Is it OK to use PowerTalk for 20 or more people without a server?
A) Yes, it's fine to use PowerTalk with 20 or more clients in a server-less environment. However larger sites might want the central administration features.

Q) How do you remove an enclosure from a letter?
A) Here are a few suggestions:

- Simply drag the Icon representing the enclosure to the desktop; a copy of the enclosed file(s) is made.

- Throw it in the trash, if you want to get rid of it

- Drag it to the destination folder. System 7 Pro or System 7.5 adds a new feature which allows dragging between applications. Things can be dragged between Finder windows and the AOCE Mailer window.

Q) Can I change PowerShare service to the Key Chain by doing a shift click and drag of several items?
A) Services added to the Key Chain are added one by one; you cannot shift click and drag.

Q) Does the Views control panel change mail Icons to larger size?
A) Changing the List Views option in the Views control panel allows for larger Icons in your mail box.

Q) Why have I stopped receiving mail in my Mailbox?
A) If the amount of space available on your startup disk is less than 2 MB, your Mailbox will refuse new mail, even if the new mail is smaller than 2 MB. Deleting mail from your Mailbox will let new mail be received.

Article Change History:
08 Feb 1995 - Added System 7.5.
18 Nov 1994 - Added Q & A on mail not being received.
13 Oct 1994 - Added keyword; made several technical updates.
16 Nov 1993 - Added additional information.

Security: Everyone

AOCE: Description and Technology Overview (10/94)

==========

Article Created: 4 October 1993
Article Reviewed/Updated: 13 October 1994

TOPIC ----------

This article provides a technology overview of the Apple Open Collaborative Environment (AOCE).

DISCUSSION ----------

The Apple Open Collaberation Environment (AOCE) includes two products:

- PowerTalk
- PowerShare

PowerTalk

System 7 Pro with PowerTalk is an upgrade to System 7 that provides a unified framework for collaboration on the Macintosh computer.

The PowerTalk package includes System 7 extensions for collaborative services, and AppleMail, a letter application for sending and receiving messages. AppleMail is included to enable PowerTalk users to immediately take advantage of the collaborative features of System 7 with PowerTalk.

PowerTalk requires a hard drive. Apple recommends 5 MB of RAM for PowerTalk users.

PowerShare

PowerShare is the AOCE server product.

The PowerShare package provides server-based services. Only customers who require a server-based environment need to purchase the PowerShare package.

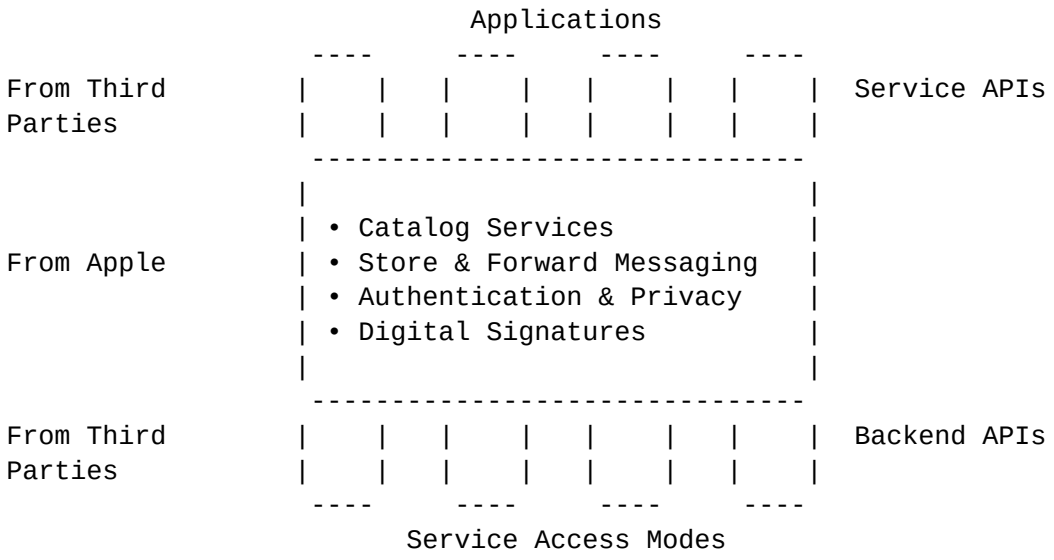
Basic collaboration services are available in the PowerTalk package.

Technology Overview

PowerTalk and PowerShare are the first Apple products to take advantage of the AOCE technology. PowerShare and System 7 with PowerTalk consist of a number of managers, toolbox packages, and new desktop facilities that provide catalog services, store and forward messaging and mail, authentication and privacy features, and digital signature capability.

Apple and Third Party Components

This diagram illustrates what comes from Apple and what comes from third parties.



What comes from Apple and what comes from third parties

NOTE: API = Application Program Interface

- Catalog Services

  PowerTalk catalog services can provide access to simple lists, which is only one of many types of information available through the PowerTalk catalogs. PowerTalk catalog services also provide access to data in any format from sounds to pictures to QuickTime movies. PowerTalk catalogs can provide access to services located on another Macintosh computer, an external directory service such as X.500, or a foreign file system such as a CD-ROM based database.

- Store and Forward Messaging

  Store and forward messaging is the ability to send messages to a server for later distribution or to hold the message locally until the destination is available to accept the incoming message. AOCE

messages can take the form of either letters exchanged between users or program to program communication.

- Authentication and Privacy

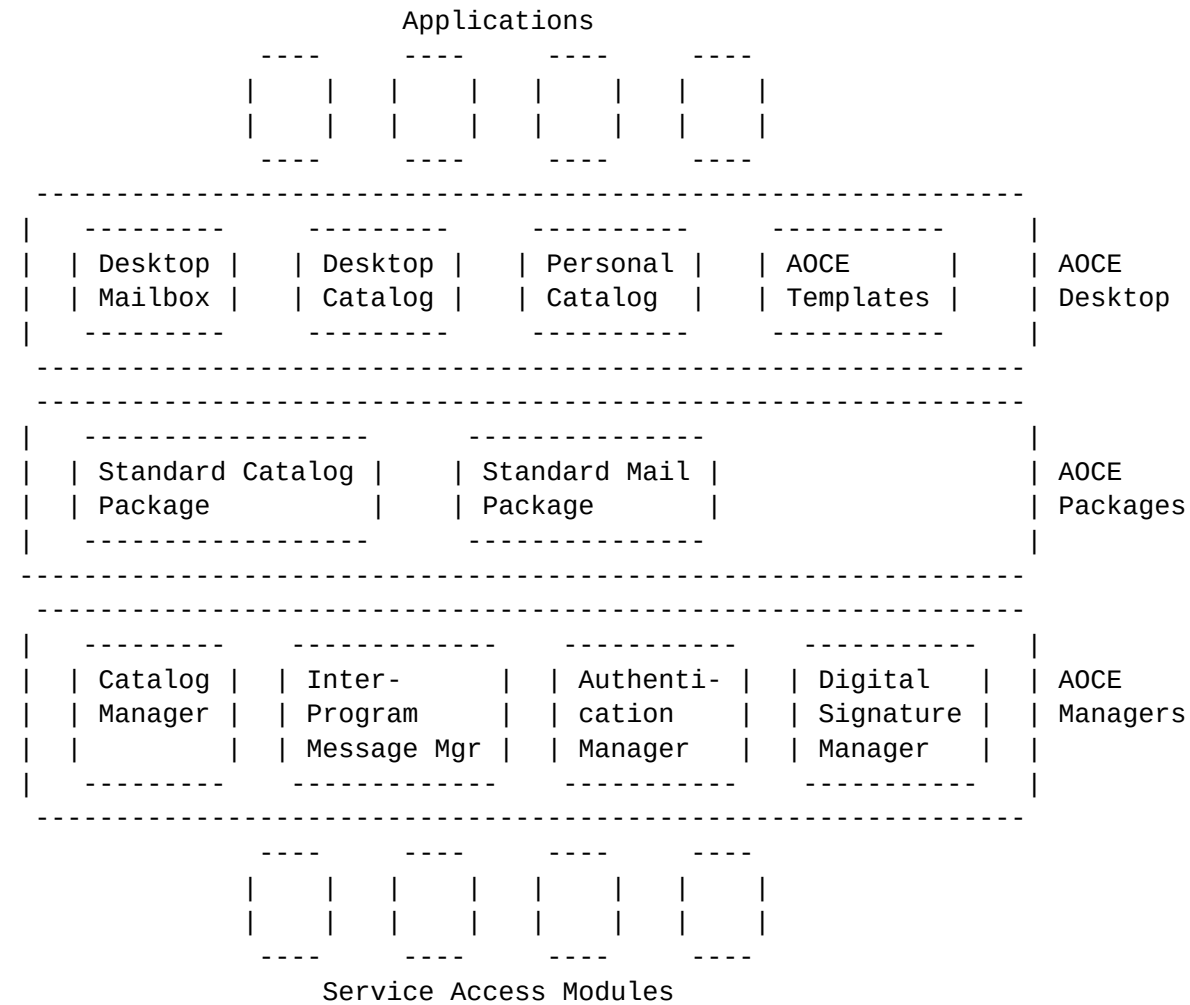
  Authentication services ensure that the communicating entities are who they claim to be. Privacy refers to a new protocol, AppleTalk Secure Data Stream Protocol (ASDSP) which prevents wire tapping.

- Digital Signatures

  Digital signatures provide a means of detecting whether data has been altered and of providing positive identification of the signer. They are especially useful in building automated workflow solutions.

AOCE Architecture

AOCE technology is built in several layers, as this diagram illustrates:



AOCE architecture

Inside the AOCE Toolbox are the managers and packages of the underlying

technology. AOCE software includes front end Application Program Interfaces (APIs) for developers to build collaborative features into existing end user applications or to build entirely new collaborative applications. AOCE technology also offers an open back end through Service Access Modules. Developers can use these APIs to connect AOCE users to existing messaging and catalog services or to new, as yet unknown, services.

The front end APIs provide a uniform way of accessing collaborative service from within third party applications. Building the services into the operating system preserves the Macintosh experience. End users access collaborative services in the same manner, no matter which vendor’s application is being used.

The open backend APIs of AOCE technology extend the reach of PowerTalk and PowerShare users to any messaging or catalog service. Service Access Modules (SAMs) make the technology fully extensible. When a new messaging or catalog standard appears, PowerTalk users can easily plug into the system through the use of a SAM.

AOCE: To Use a PowerShare Server or Not (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: To Use a PowerShare Server or Not (10/93)

==========

Article Created: 4 October 1993

TOPIC -----

This article describes what requirements are needed in helping to determine if PowerShare Services are necessary in Apple Open Collaborative Environment (AOCE).

DISCUSSION -----

Not all PowerTalk users require a server-based environment. Stand-alone users or users in a small network will not require a server to take advantage of the package of collaboration services included in PowerTalk. Direct AppleTalk mail does not require a server. Neither does messaging using personal Mail Service Access Modules. For small workgroups who wish to communicate only with each other through AppleTalk or with the outside world through personal Mail Service Access Modules, there is no need for a server. A typical server-less AOCE installation will be one in which the AppleTalk and Personal Catalog features are sufficient for catalog services, personal Mail Service Access Modules are available for any external messaging, and security is not a critical issue.

However, if authentication and security is an issue for the customer, then a server-based environment is indicated. The PowerShare Catalog Server is required in order to take advantage of the authentication services and to utilize ASDSP across the network.

Some installations may also have a need for server-based messaging. Examples include installations where one Macintosh is shared by several users, and situations where users travel frequently and dial into one central point for messages.

AOCE: DigiSign What It Does (12/94)

Revised: 12/9/94
Security: Everyone

AOCE: DigiSign What It Does (12/94)

==========

Article Created: 04 October 1993
Article Reviewed/Updated: 09 December 1994

TOPIC -----

DigiSign is Apple’s implementation of digital signature technology. It is a way of electronically signing data. With a digital signature attached, a user can verify the signature to detect whether or not the data has been altered since the signature was attached. Signature verification also checks the validity of the signature itself, providing positive identification of who signed the data.

DISCUSSION -----

DigiSign has two goals:

- To provide a mechanism by which a user can detect whether or not a document has been altered since the time it was signed

- To positively identify the signer

Signing a document does not in any way encrypt data or prevent it from being altered. While the process of signing something does use encryption in the signature process, it is not possible to use DigiSign or Apple’s digital signature manager to encrypt data.

Signing a document does not prevent someone else from reading or altering the document. The data is not encrypted, just as it was before the signature was attached. Anyone can read it and anyone can make changes.

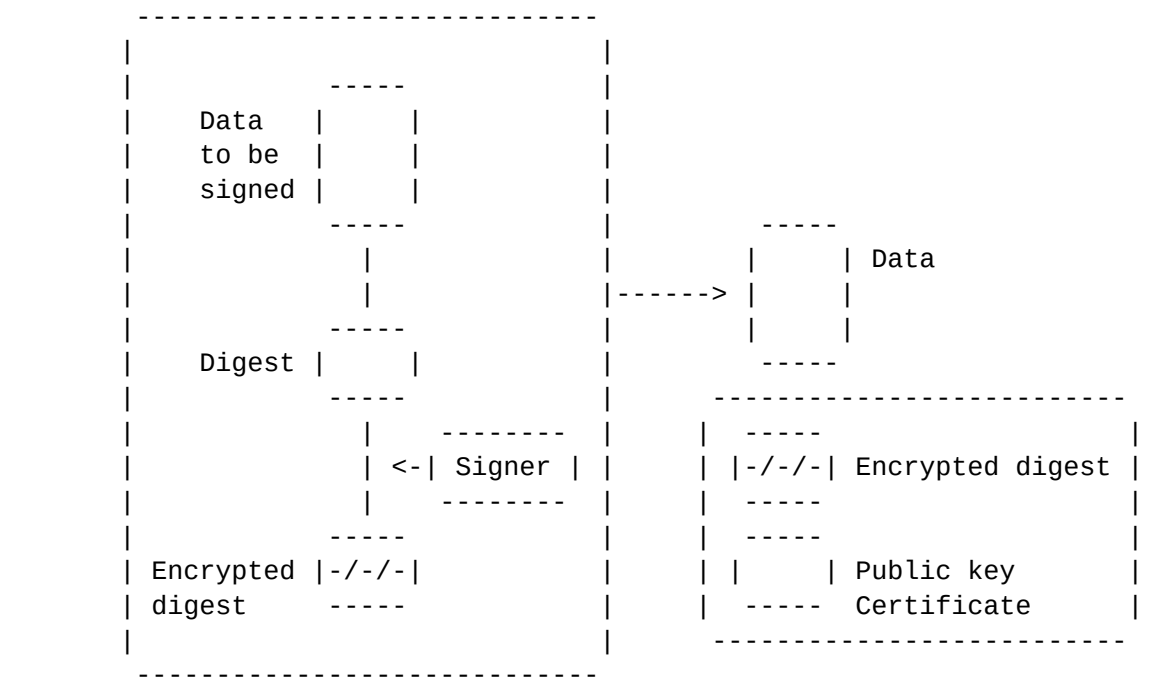
The process of verifying a signature detects whether or not changes have been made although it is not possible to discover what the changes were.

How to Sign Something

The process of signing something begins with the data to be signed. The digital signature manager creates a 16 byte digest. The digest is a highly sophisticated

checksum of the data. It is nearly impossible for two sets of data that differ in any way to produce the same digest.

This diagram ilustrates the signing process:



The signer file uses a private key from the signer file to encrypt the digest. The data itself is not encrypted. Only the digest of the data is encrypted.

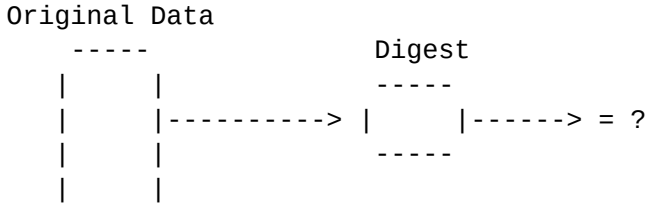
The resulting encrypted digest and a public key certificate are appended to the data file as a signature resource. The original data remains unchanged and unprotected from anyone reading the data or making changes to it. The only thing that is changed about the file is the addition of the signature resource.

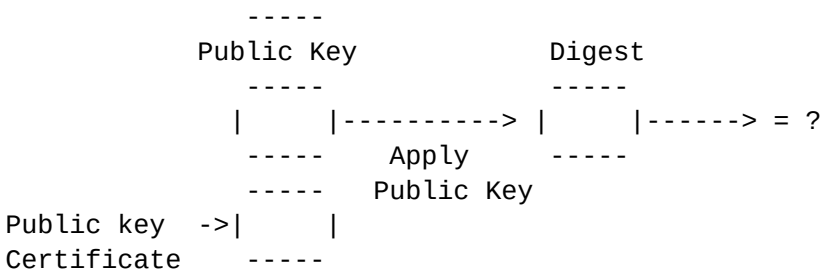
How to Verify Something

The process of verifying a signature begins with calculating a new digest of the original data. Next, the public key is retrieved from the public key certificate in the digital signature attached to the document. The public key is used to decrypt the encrypted version of the digest.

The two digests are then compared. If they match, the signature verifies. If they do not match, then something has been changed on the original document so that the digests are different.

This diagram illustrates the verification process:





The process of signature verification also verifies all signatures in the attached public key certificate. This is to ensure that the signature itself is valid and has not been altered.

Finder Signing

Third party applications will integrate digital signature technology into their products. For example, Shana Corporation will incorporate digital signature technology into their Informed Manager product to enable electronic authorization of forms.
PowerTalk users can sign entire files from the Finder by dragging a file to be signed onto a Signer file. Files signed from the Finder have a signature resource attached to them. The document is also locked. However, the file locking is not secure. In order to unlock the document, the user need only select the document, choose Get Info from the File menu and then uncheck the Locked check box. The purpose of locking the file is to prevent casual changes to the document, not to secure the file against any possible changes.
If the name of the file changes, the signature still verifies. The reason for this is that the document itself has not changed, only the name of the document.

- Validating a Signature

  A file signed from the Finder has a new icon in the Get Info window for the file the Verification button. Click this button and a DigiSign dialog box appears.

  To verify the signature, click the Verify button in the DigiSign dialog box. The signature is checked for validity. If the signature is verified a successful signature dialog box is displayed.

  If the signature fails to verify, a dialog displays stating, “The signature of ‘Document Name’ could not be verified. Either the file has been modified since it was signed or the signature itself has been altered”.

- Removing a Digital Signature

  To remove a digital signature from a document signed in the Finder, click the Remove button instead of the Verify button in the preceding process.

PowerShare Collaboration Servers Description (10/93)

==========

Article Created: 4 October 1993

TOPIC ----------

This article describes the PowerShare Collaboration Servers.

DISCUSSION ----------

Features

- Easy administration
  - Provides consistency and ease of administration for large teams of PowerTalk users
  - Includes easy-to-use administrative utilities to streamline installation and management
  - Allows server management from any Macintosh on the network
  - Enables the network administrator to control access to shared catalogs
- Automatic network security
  - Authenticates PowerTalk users and PowerTalk-savvy applications
  - Encrypts network traffic between PowerTalk users and applications
- Scalability
  - Allows a network administrator to set up a single server in minutes
  - Provides the infrastructure to support large multiserver distributed systems
- Collaboration on demand

- Allows multiple users and applications to share PowerTalk catalogs and access modules

- Lets mobile PowerTalk users keep in touch with colleagues easily anytime, anywhere

Summary

PowerShare collaboration server software provides System 7 Pro PowerTalk users with server-based messaging, shared catalog, and network security services on AppleTalk networks. PowerShare provides the foundation on which organizations can build team productivity and workflow solutions.

The PowerShare Mail Server acts as a store-and-forward agent for PowerTalk messages, ensuring delivery even when the sender and recipient systems are not available at the same time. Mobile users can use AppleTalk Remote Access to dial in at any time to send and retrieve messages.

The PowerShare Catalog Server is a shared repository for collaborative information such as employee databases and corporate document templates. Storing PowerTalk catalogs on shared servers minimizes administrative overhead. PowerShare servers automatically authenticate PowerTalk users and encrypt their network traffic to ensure the privacy of sensitive information.

Multiple PowerShare servers can work together using distributed, replicated catalogs that provide higher performance and greater reliability. This makes PowerShare as useful for organizations with thousands of users as it is for small teams. Replicated catalogs are easy to manage because PowerShare automatically keeps them synchronized.

Software modules from other vendors allow PowerShare servers to connect with other messaging systems such as QuickMail from CE Software, Microsoft Mail, Internet/SMTP, and X.400. These gateways enable PowerTalk users to exchange mail with users on the other systems. Because the access modules reside on a PowerShare server instead of on individual systems, gateway management is simplified and the cost of providing access to all users is minimized.

PowerShare servers can act as the focus for collaborative applications ranging from basic electronic mail to sophisticated scheduling, project management, and business-forms routing. Independent software developers are creating innovative applications in all of these categories that take advantage of PowerTalk and PowerShare technology, enabling the deployment of a wide range of team productivity and workflow solutions. Network administrators will be able to manage multiple collaborative applications with a single catalog.

PowerShare collaboration server software can be installed on the same Macintosh computer as AppleShare or other server software, and can be administered from any Macintosh system on the network.

Technical Specifications

- PowerShare Mail Server
  - Provides server-based messaging services for PowerTalk users
  - Stores PowerTalk messages to ensure delivery when user systems come on line
- PowerShare Catalog Server
  - Stores collaborative information—such as group addresses, document templates, graphics, and sound—in shared catalogs
  - Authenticates users and encrypts their network traffic
  - Supports multiserver distributed systems
  - Replicates and synchronizes catalogs across multiple servers for higher performance and greater reliability
  - Lets you find, open, save, view, and create new shared catalogs
- PowerShare System Manager's Utility
  - Monitors mail and catalog server activity, user accounts, and stored messages
  - Provides system alerts to the administrator
  - Allows server management from any Macintosh system on the network
- Easy Setup
  - Automatically sets up basic PowerShare Mail and Catalog servers

System requirements

- Apple Macintosh personal computer with at least 4MB of RAM for each installed server (Mail and/or Catalog Server)
- Hard disk
- System software version 7.1.1 and utilities

Ordering Information

PowerShare Collaboration Servers
In the U.S., Order No. M1272LL/A
Outside the U.S., Order No. M1272Z/A

- System software version 7.1.1 and utilities

- PowerShare software version 1.0, including Mail Server, Catalog Server, System Manager's Utility, and Easy Setup application

- PowerShare System Manager's Guide

AOCE: PowerTalk Icons Presented On The Desktop (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: PowerTalk Icons Presented On The Desktop (10/93)

==========

Article Created: 4 October 1993

TOPIC --------------------

This article describes the new icons found on the desktop with PowerTalk.

DISCUSSION --------------------

PowerTalk puts three new icons on the desktop, the Catalogs icon, the Mailbox icon and the PowerTalk Key Chain.

Opening the Catalogs icon displays the different catalogs available. Examples include a PowerShare Catalog, the AppleTalk catalog, or an X.500 directory service.

The Mailbox contains all incoming and outgoing mail. Mail from any source, in any format is accessible through the Mailbox.

The PowerTalk Key Chain protects access to the services available through the Catalogs and Mailbox icons. The PowerTalk Key Chain provides users with one stop access to a variety of collaboration services.

AOCE: PowerTalk Key Chain Features (10/93)

Revised: 9/30/93
Security: Everyone

AOCE: PowerTalk Key Chain Features (10/93)

==========

Article Created: 4 October 1993

TOPIC --------------------

This article describes how the PowerTalk Key Chain protects access to the services available through Catalogs and Mailbox icons. The PowerTalk Key Chain provides users with one stop access to a variety of collaboration services.

DISCUSSION --------------------

In today's electronically connected world, a user may receive incoming messages from an overwhelming number of sources. It is not uncommon for employees to have accounts on a network mail system (for example, AppleLink, Internet, or other company mail system), a LAN mail system (for example, QuickMail), and voice mail. Logging into multiple message services can be time consuming as well as confusing.

The PowerTalk Key Chain makes it possible to access all of these services while remembering only one Access Code to access all of the other catalog and messaging services they may use.

The first time AOCE services are accessed after installation, the user will be prompted to enter an Access Code for the PowerTalk Key Chain.

The PowerTalk Key Chain protects access to other messaging and catalog services available through PowerTalk. In order to access services protected by PowerTalk, the user must enter the correct Access Code.

Unlike the Catalogs or In Tray icons, the PowerTalk Key Chain icon can be moved from the desktop. Once the PowerTalk Key Chain has been created, the user can move it to anywhere on the local disk.

Once the PowerTalk Key Chain has been configured, the user can configure access to other services into the PowerTalk Key Chain.

For example, the PowerTalk Key Chain can be configured to give a user access to messaging services available through both Direct AppleTalk mail and a PowerShare Mail Server. The Key Chain can also have a key for an AppleShare file server. The user has to configure access to the services once. After the initial configuration is complete, the user only has to remember the access code to their PowerTalk Key Chain to access all services linked to keys in the PowerTalk Key Chain.

- Changing The PowerTalk Key Chain Name
  To change the name of the PowerTalk Key Chain, click the PowerTalk Key Chain icon in the upper right hand corner of the PowerTalk Key Chain window.

  The user then has the option of entering either a new PowerTalk Key Chain name or a new Access Code.

- Automatically Locking The PowerTalk Key Chain
  The PowerTalk Key Chain must be unlocked each time the Macintosh computer boots. This prevents unauthorized use of the services protected by the PowerTalk Key Chain.

  The AOCE PowerTalk Key Chain will also lock itself after a period of inactivity. The timeout period can be controlled using the AOCE Setup control panel. By default, the automatic locking feature is turned off. To enable it, enter a number in the AOCE Setup control panel dialog box.

  If a user is going to be away from their Macintosh computer for a period of time and would like to prevent someone else from accessing the services protected by the PowerTalk Key Chain, it is possible to lock the PowerTalk Key Chain. To do this, select Lock Key Chain from the Special menu. Once the PowerTalk Key Chain has been locked, PowerTalk services will not be available on this Macintosh computer until the user provides the correct access code to unlock the PowerTalk Key Chain.

- Access Code Requirements
  The Access Code must be greater than six characters in length. Apple recommends that access codes include symbols or numbers as well as letters.

68LC040 Macintosh Computers: FPU Upgrade (7/95)

Revised: 7/6/95
Security: Everyone

68LC040 Macintosh Computers: FPU Upgrade (7/95)

==========

Article Created: 21 October 1993
Article Reviewed/Updated: 06 July 1995

TOPIC ----------

Can I add an FPU (floating point unit) to any of the following computers:
-Macintosh LC 475
-Performa 475 and 476
-Quadra 605
-Macintosh 57x Family
-Macintosh 630 Family

The following computers are in the Macintosh 57x family: Performa 575, Performa 577, Performa 578, and LC 575.

The following computers are in the Macintosh 630 family: Performa 630, Performa 635, Performa 636, Performa 637, Performa 638, LC 630, and Quadra 630.

DISCUSSION ----------

The Macintosh LC 475, Performa 475 and 476 and the Quadra 605 have a 25MHz 68LC040 microprocessor. Computers in the Macintosh 57x family and the Macintosh 630 family have a 33MHz 68LC040 microprocessor. In order to upgrade to a microprocessor with a floating point unit (FPU), it is necessary to remove the existing microprocessor from its socket, and replace it with a full 68040 microprocessor, which corresponds to the speed of the original 68LC040 processor. Unlike the LC III, these models have no specific FPU socket on the logic board.

Such an upgrade would not come from Apple. Apple has no plans to market an FPU upgrade, nor does Apple officially support this configuration

Article Change History:
07 Jul 1995 - Added Macintosh 57x and 630 families
11 Nov 1993 - Added note that Apple doesn't support third-party upgrade.

LC 475, Performa 475 & 476, Quadra 605: Custom ICs (10/93)

Revised: 10/27/93
Security: Everyone

LC 475, Performa 475 & 476, Quadra 605: Custom ICs (10/93)

==========

Article Created: 21 October 1993

TOPIC ----------

This article describes the custom integrated circuits (ICs) in the Macintosh LC 475, Performa 475 and 476, and Quadra 605.

DISCUSSION ----------

The Macintosh LC 475, Performa 475 and 476, and the Quadra 605 support VRAM-based video and utilize a MEMC Jr. memory controller.

The MEMC Junior IC

The MEMC Jr. (the Most Excellent Memory Controller Junior) chip is a 208-pin Apple-designed integrated circuit which controls video display processing as well as memory control. The result is improved performance compared to the Quadra 700, 900, and 950 video.

The LC 475 and the Quadra 605 use the same 15-pin connector for video output used by the Quadra 700 and 900, as well as other Apple systems.

The Apple AudioVision 14 Monitor requires an adapter which connects the monitor cable on one end to the individual input/output ports such as Video and ADB.

LC 475, Performa 475 & 476, Quadra 605: Expansion Slot (10/93)

Revised: 10/27/93
Security: Everyone

LC 475, Performa 475 & 476, Quadra 605: Expansion Slot (10/93)

==========

Article Created: 21 October 1993

TOPIC -----

This article describes the expansion slot in the Macintosh LC 475, Performa 475 and 476, and the Quadra 605.

DISCUSSION -----

The expansion slot in the Macintosh LC 475, Performa 475 and 476, and the Quadra 605 is not a true 040 PDS slot because it does not directly access the microprocessor bus. The expansion slot is an LC III compatible expansion connector: most cards that work with LC II, LC III, and LC 520 work with these systems. Examples: Ethernet cards for the LC Family, video cards for the LC family, and the Apple IIe Card.

Cards that are 030 specific, such as 030 accelerators or 030 cache cards, will not work with these models because they require direct access to the 68030 microprocessor. Those cards are intended to speed the 68030 microprocessor to higher performance levels that are already attainable with the 68040 microprocessor. However, accidentally plugging in an 030 accelerator or cache card will not cause any damage to your Macintosh.

Article change history:
13 October 1993 - Also compatible with LC II & LC 520 cards.

Macintosh LC 475: Description (6/95)

==========

Article Created: 1 October 1993
Articel Reviewed/Updated: 13 June 1995

TOPIC ----------

This article is an overview of the Apple Macintosh LC 475 personal computer.

DISCUSSION ----------

Summary

The Macintosh LC 475 is the new fast flexible affordable computer system for working, learning, and productivity.

It's the first LC model that uses the Motorola 68040 processor, making it more than twice as fast as the LC III. It has many features that are expensive options on other computers, including stereo sound, built-in networking, and support for all Apple and various third-party displays. It can display up to 256 colors on all Apple displays, and with additional video RAM, more than 32,000 colors on the 14-inch and 16-inch Macintosh color displays. The built-in Apple SuperDrive lets you work with documents created in different computing environments: it can read from, and write to, Windows, MS-DOS, OS/2, and Apple II ProDOS disks. There's an expansion slot for special options, such as video capture, Apple IIe emulation, or Ethernet networking. Multiple ports let you easily add peripherals such as a high-capacity CD-ROM drive, scanner, and modem. The LC 475 is fully compliant with the EPA's Energy Star program.

Features

• 25-MHz 68LC040 microprocessor
• 4MB of RAM on board, expandable to 36MB
• Support for all Apple and many third-party displays
• 256 colors, expandable to 32,768 with VRAM upgrade

Expansion

• Slot supports most Macintosh LC II, LC III, and LC 520 expansion cards
• Seven built-in ports for peripherals

System Software

System software version 7.1 with multitasking, file sharing, QuickTime, Balloon Help, and TrueType.

Networking

• Built-in AppleTalk networking
• File sharing without a dedicated server

Compatibility

Reads Macintosh, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats

Ordering Information

Order No. M1818LL/A
• Macintosh LC 475 computer with 4MB RAM, 512K VRAM, built-in 1.4MB Apple SuperDrive, internal 80MB hard drive, mouse, manuals (no keyboard)

Order No. M1819LL/A
• Macintosh LC 475 computer with 8MB RAM, 512K VRAM, built-in 1.4MB Apple SuperDrive, internal 160MB hard drive, mouse, manuals (no keyboard)

Order No. M1944LL/A
• Macintosh LC 475 computer with 4MB RAM, 512K VRAM, built-in 1.4MB Apple SuperDrive, internal 80MB hard drive, mouse (no disks, no manuals, no keyboard)

Macintosh LC 475 Education Accessory Kit
Order No. M1945LL/A

VRAM Expansion Kit
part number 661-1021
(Requires two kits for expansion to 1MB VRAM)

DRAM Expansion Kit
Order No. M1507LL/A (4MB)

Macintosh LC 475: Displays (10/93)

==========

Article Created: 1 October 1993

TOPIC ----------

This article describes display options for the Macintosh LC 475 computer system.

DISCUSSION ----------

512K VRAM in SIMMs (for 256 colors) is standard. VRAM is expandable to 1MB for 32,000 colors.

The Macintosh LC 475 works with all Apple and many third-party displays from 12-inch to 21-inch, including portrait displays and VGA monitors. Some examples:

- Macintosh 12" RGB Display

  with 512K of VRAM:
  512 by 384 pixels with 1, 2, 4, 8, or 16 bits per pixel
  (thousands of colors/256 grays)

  with 1MB of VRAM:
  512 by 384 pixels 1, 2, 4, 8, or 16 bits per pixel
  (thousands of colors/256 grays)

- Macintosh 12-inch Monochrome Display, AppleColor High-Resolution Monitor (13-inch), and Macintosh Color Display (14-inch)

  with 512K of VRAM:
  640 by 480 pixels with 1, 2, 4, or 8 bits per pixel
  (256 colors/256 grays)

  with 1MB of VRAM:
  640 by 480 pixels 1, 2, 4, 8, or 16 bits per pixel
  (thousands of colors/256 grays)

- Macintosh Color Display
  with 512K of VRAM:
  640 by 480 pixels with 1, 2, 4, or 8 bits per pixel
  (256 colors/256 grays)

  with 1MB of VRAM:
  640 by 480 pixels 1, 2, 4, 8, or 16 bits per pixel
  (thousands of colors/256 grays)

- Macintosh Portrait Display (15-inch)

  with 512K of VRAM:
  640 by 870 pixels with 1, 2, or 4 bits per pixel
  (16 grays)

  with 1MB of VRAM:
  640 by 870 pixels 1, 2, 4, or 8 bits per pixel
  (256 grays)

- Macintosh 16-inch Color Display

  with 512K of VRAM:
  832 by 624 pixels with 1, 2, 4, or 8 bits per pixel
  (256 colors/grays)

  with 1MB of VRAM:
  832 by 624 pixels 1, 2, 4, 8, or 16 bits per pixel
  (thousands of colors/grays)

- Macintosh 21-inch Color Display

  with 512K of VRAM:
  1152 by 870 pixels with 1, 2, or 4 bits per pixel
  (16 colors/grays)

  with 1MB of VRAM:
  1152 by 870 pixels 1, 2, 4, or 8 bits per pixel
  (256 colors/grays)

- VGA Monitors (with a special adapter cable)

  with 512K of VRAM:
  640 by 480 pixels with 1, 2, 4, or 8 bits per pixel
  (256 colors/256 grays)

  with 1MB of VRAM:
  640 by 480 pixels 1, 2, 4, 8, or 16 bits per pixel
  (thousands of colors/256 grays)

Other Apple and non-Apple monitors may also be supported, if used in conjunction with expansion cards or adapters. See your authorized Apple service provider for details.

Macintosh LC 475: Logic Board Upgrade (Discontinued)

Revised: 7/11/95
Security: Everyone

Macintosh LC 475: Logic Board Upgrade (Discontinued)

==========

Article Created: 1 October 1993
Article Reviewed/Updated: 11 July 1995

TOPIC ----------

A Macintosh LC II or Macintosh LC III can be upgraded to a Macintosh LC 475 with a logic board upgrade. The upgrade kit can also be used to upgrade a Performa 400, 405, 410, 430, 450, 460, 466, or 467.

There is no kit for upgrading a Macintosh LC to a Macintosh LC 475, but a Macintosh LC can be upgraded to a Macintosh LC III.

** IMPORTANT NOTE **
Apple discontinued this logic board upgrade in June 1995. There may be some third party resellers who still carry this logic board upgrade, but it is no longer available directly from Apple Computer, Inc. or Apple Authorized resellers.

DISCUSSION ----------

Contents

- Macintosh LC 475 logic board
- Name badge sheet
- Getting Started manual
- Install Me First disk
- Disks Tools disk
- Agency approval label
- Resource Guide
- Product return form

The kit does not include system software. Customers who have already upgraded System software to version 7.1 can use it with their logic board upgrade. Customers who have not upgraded to system 7.1 will need to purchase it.

Ordering Information

M2139 Macintosh LC 475 Logic Board Upgrade

Article Change History:
11 Jul 1995 - Added information about upgrade being discontinued.
19 Oct 1993 - Added list of Performa models that can use this kit.
04 Jan 1994 - Added note that the kit is not yet available.

Macintosh LC 475: Specifications (8/95)

Revised: 8/3/95
Security: Everyone

Macintosh LC 475: Specifications (8/95)

==========

Article Created: 1 October 1993
Article Reviewed/Updated: 03 August 1995

TOPIC ----------

This article provides the technical specifications for the Macintosh LC 475 computer system.

DISCUSSION ----------

Microprocessor

- 68LC040, 32-bit architecture, 25 mHz clock frequency
  Can be upgraded to full 68040, which includes FPU. (Such an upgrade would not come from Apple. Apple has no plans to market an FPU upgrade, nor does Apple officially support this configuration).
- CMOS custom clock/calendar with long-life lithium battery

Memory

- 4MB RAM, expandable to 36MB via 72-pin socket. Upgrade with 1MB, 4MB, 16MB single-sided SIMMs; or 2MB, 4MB, or 32MB double-sided SIMMs. Possible configurations are 4MB, 5MB, 6MB, 8MB, 12MB, 20MB, and 36MB. SIMMs are the same as those used in Macintosh LC III, and Centris/Quadra 610 and 650.

- 512K VRAM for 256 colors, expandable to 1MB for 32,000 colors

Displays

The LC 475 works with all Apple and many third-party displays from 12-inch to 21-inch, including VGA and portrait displays. A separate Tech Info Library article provides details.

Storage

- Built-in Apple SuperDrive 1.4MB high-density floppy disk drive, reads

disks from Macintosh, Apple II, MS-DOS, and Windows systems
• Internal 80MB or 160MB SCSI hard disk drive
• Optional external SCSI hard disk drives (several capacities available)
• Optional external AppleCD CD-ROM drive

Electrical Requirements

• Line voltage: 90 to 240 volts AC, RMS single-phase
• Frequency: 50 to 60 Hz
• Power: 30 watts maximum, not including display power

Interfaces

• One Apple Desktop Bus (ADB) port supports a keyboard, mouse, and other devices (up to three devices) daisy-chained through a low-speed, synchronous serial bus
• Two serial (RS-232/RS-422) ports, 230 kilobits per second maximum (up to 920 Kbits per second if clocked externally)
• SCSI interface for connecting up to six external devices
• Video port supports RGB and monochrome monitors of various sizes and resolutions
• Sound output port for external audio amplifier or headphones
• Sound input port for monaural sound input - Requires Plaintalk Microphone (monaural 8-bit sound, sampled at 22 or 11 kHz)
• Internal expansion slot for one expansion card, which can accommodate 96-pin (as in LC II) or 114-pin (as in LC III) expansion cards. Accepts Apple IIe Card.

Keyboard and Mouse

• ADB keyboard not included; several models available
• Apple ADB Mouse II

Apple Desktop Bus Power Requirements

• Maximum current draw for all ADB devices: 500 milliamperes (mA)
• Recommended maximum of three ADB devices
• Mouse draws 10 mA
• Keyboard draws 25 to 80 mA, depending on model

Sound Generator

Stereo 8-bit sound capable of driving stereo headphones or other stereo equipment through the sound jack.

Software

System Software 7.1 with Enabler 065

Disability Access

• CloseView, Easy Access, and "visible beep" software are built in.
• Third-party options provide other alternative input and output devices

Size and Weight

- Main Unit
  Weight: 8.8 lb. (4.0 kg)
  Height: 3.2 inches (81 mm)
  Width: 12.2 inches (310 mm)
  Depth: 15.0 inches (382 mm)
- Mouse
  Weight: 4 oz. (0.10 kg)
  Height: 1.3 inches (33 mm)
  Width: 2.4 inches (61.7 mm)
  Depth: 4.2 inches (107.3 mm)

Environment

- Operating temperature: 10 to 40 C (50 to 104 F)
- Storage temperature: -40 to 47 C (-40 to 116.6 F)
- Relative humidity: 20% to 95% (noncondensing)
- Maximum altitude: 4722 m (15,000 ft.)

Article Change History:
03 Aug 1995 - Added information on Plaintalk Microphone requirements.
08 Oct 1993 - Deleted incorrect reference to FPU socket and VRAM expansion.
13 Oct 1993 - Deleted reference to keyboard, which is not included.

Performa 475 and 476: Description (10/93)

==========

Article Created: 1 October 1993

TOPIC ----------

This article is an overview of the Macintosh Performa 475 and Performa 476 personal computers.

DISCUSSION ----------

Summary

These two products differ in three ways:
• Hard drive capacity
• Application software installed
• Where sold

The Performa 475 and 476 have many features that are expensive options on other computers, including stereo sound, built-in networking, and support for all Apple and various third-party displays. They can display up to 256 colors on all Apple displays, and with additional video RAM, more than 32,000 colors on the 14-inch and 16-inch Macintosh color displays. The built-in Apple SuperDrive lets you work with documents created in different computing environments: it can read from, and write to, Windows, MS-DOS, OS/2, and Apple II ProDOS disks. There's an expansion slot for special options, such as video capture, Apple IIe emulation, or Ethernet networking. Multiple ports let you easily add peripherals such as an external hard drive, high-capacity CD-ROM drive, and scanner.

They are fully compliant with the EPA's Energy Star program.

Features

• 25-MHz 68LC040 microprocessor
• 4MB of RAM on board, expandable to 36MB
• Hard drive: Performa 475 160MB, Performa 476 230MB
• Support for all Apple and many third-party displays

- 256 colors, expandable to 32,768 with VRAM upgrade

Expansion

- Slot supports most Macintosh LC II, LC III, and LC 520 expansion cards
- Seven built-in ports for peripherals

Software

- System software version 7.1P3 with multitasking, file sharing, QuickTime, Balloon Help, and TrueType.
- At Ease software lets adults share the computer with children -- while protecting valuable data.
- A variety of application software already installed.
- Launcher provides easy launching of applications, and provides customers with easy access to service and support assistance, users tips, etc.

Networking

- Built-in AppleTalk networking
- File sharing without a dedicated server

Compatibility

Reads Macintosh, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats

Performa 475 & 476: Specifications (8/95)

==========

Article Created: 1 October 1993
Article Reviewed/Updated: 15 August 1995

TOPIC ----------

This article provides the technical specifications for the Macintosh Performa 475 and Performa 476 computer systems. These two products differ in three ways:

- Hard drive capacity
- Application software installed
- Where sold

DISCUSSION ----------

Microprocessor

- 68LC040, 32-bit architecture, 25 mHz clock frequency
- CMOS custom clock/calendar with long-life lithium battery

Memory

4MB RAM, expandable to 36MB
512K VRAM for 256 colors, expandable to 1MB for 32,000 colors

Display

- Macintosh Performa Plus Display (14 inch)

  with 512K of VRAM:
  640 x 480 pixels with 1, 2, 4, or 8 bits per pixel
  (256 colors/grays)

  with 1MB of VRAM:
  640 by 480 pixels with 1, 2, 4, 8, or 16 bits per pixel
  (thousands of colors/256 grays)

Storage

- Built-in Apple SuperDrive 1.4MB high-density floppy disk drive, reads disks from Macintosh, Apple II, MS-DOS, and Windows systems
- Performa 475: internal 160MB SCSI hard disk drive
  Performa 476: internal 230MB SCSI hard disk drive
- Optional external SCSI hard disk drives (several capacities available)
- Optional external AppleCD CD-ROM drive

Modem

- TelePort/Bronze for Macintosh Performa (from Global Village Communication, Inc.)
- GlobalFax software (send-only fax) for 9600-baud faxing from any application to fax machines worldwide (upgradable to receive fax via software)
- Modem also serves as 300/1200/2400-baud data modem
- No separate power adapter required

Power Input

- Line voltage: 90 to 240 volts AC, RMS single-phase
- Frequency: 50 to 60 Hz
- Power: 30 watts maximum, not including display power

Interfaces

- One Apple Desktop Bus (ADB) port supports a keyboard, mouse, and other devices (up to three devices) daisy-chained through a low-speed, synchronous serial bus
- Two serial (RS-232/RS-422) ports, 230 kilobits per second maximum (up to 920 Kbits per second if clocked externally)
- SCSI interface for connecting up to six external devices
- Video port supports shadowmask, RGB, and monochrome displays of various sizes and resolutions
- Sound output port (stereo) for external audio amplifier or headphones
- Sound input port for monaural sound input* (monaural 8-bit sound, sampled at 22 or 11 kHz)
- Internal PDS expansion slot for one expansion card

*NOTE:
The Apple PlainTalk Microphone, which is sold as a standalone product, is compatible with these systems. These products cannot use the older style low-level output microphone used on previous Macintosh models.

Keyboard and Mouse

- Apple Desktop Bus (ADB) keyboard with numeric keypad and two-level tilt adjustment
- Apple ADB Mouse II

Apple Desktop Bus Power Requirements

- Maximum current draw for all ADB devices: 200 milliamperes (mA)
- Recommended maximum of three ADB devices
- Mouse draws 10 mA
- Standard keyboard draws 25 mA (third-party keyboards draw up to 80 mA)

Sound Generator

- Stereo 8-bit sound that can drive stereo headphones or other stereo equipment through the sound jack.

Software

- Macintosh System Software version 7.1P3, designed specifically for Performa computers.
- At Ease software lets adults share the computer with children -- while protecting valuable data.
- Macintosh PC Exchange lets you work with MS-DOS and Windows disks.
- Application software: a selection of productivity and communication tools already installed on the hard drive.
- Launcher software provides easy way to launch applications, and provides easy access to service and support information, user tips, etc.

Disability Access

- CloseView, Easy Access, and "visible beep" software are built in.
- Third-party options provide other alternative input and output devices

Size and Weight

- Main Unit
  Weight: 8.8 lb. (4.0 kg)
  Height: 3.2 inches (81 mm)
  Width: 12.2 inches (310 mm)
  Depth: 15.0 inches (382 mm)
- Mouse
  Weight: 4 oz. (0.10 kg)
  Height: 1.3 inches (33 mm)
  Width: 2.4 inches (61.7 mm)
  Depth: 4.2 inches (107.3 mm)
- Keyboard
  Weight: 2.2 lb. (1 kg)
  Height: 1.8 inches (44 mm)
  Width: 16.5 inches (418 mm)
  Depth: 5.6 inches (142 mm)

Environment

- Operating temperature: 10 to 40° C (50 to 104° F)
- Storage temperature: -40 to 47° C (-40 to 116.6° F)
- Relative humidity: 20% to 80% (noncondensing)
- Maximum altitude: 3048 m (10,000 ft.)

Service and Support

- One year limited warranty
- One year free in-home service
- Toll-free help line
- Support for non-Apple software is provided by the respective software publishers.

Article Change History:
15 Aug 1995 - Included PlainTalk microphone information.
26 Jul 1994 - Expanded sound output information.
24 Feb 1994 - Corrected ADB amperage rating

Portable StyleWriter: Undocumented Self Tests (10/93)

Revised: 10/1/93
Security: Everyone

Portable StyleWriter: Undocumented Self Tests (10/93)

==========

Article Created: 1 October 1993

TOPIC -----

This article describes additional self test information that is not documented in the Owner's manual.

DISCUSSION -----

Make sure paper is loaded into the printer first. All of the tests are continuous. To stop the tests, turn off the printer.

1: Power on the printer. After the beep let up on the power button, press the "PITCH" button and hold it until you hear another beep. Then, let up on the "PITCH" button. The printer will print a sample of the 11 built-in fonts for the CANON BJ-10e.

2: Power on the printer. After the beep, let up the power button. Press the "LF/FF" button and hold it down until you hear another beep. Then let up on the "LF/FF" button. The printer will print a "barber pole" test print.

3: Power on the printer while holding down the "ON LINE" and "LF/FF" buttons. After the first beep, let up on the power button. After the second beep let go of the "ON LINE" and "LF/FF" buttons. The printer will print rows of "H"s.

Performa 460, 466, 467: RAM and VRAM Specifications (10/93)

Revised: 10/15/93
Security: Everyone

Performa 460, 466, 467: RAM and VRAM Specifications (10/93)

==========

Article Created: 1 October 1993

TOPIC ----------

This article describes the RAM and VRAM specifications for the Performa 460, 466 and 467.

DISCUSSION ----------

RAM

The Performa 460, 466 and 467 has 4 megabytes (MB) of memory soldered to the logic board and a single 72-pin SIMM RAM expansion socket.

The Performa 460, 466 and 467 can accomodate 1MB, 2MB, 4MB, 8MB, 16MB and 32MB RAM SIMMs. They do not support 256K SIMMs. You must use 72-pin fast-paged mode SIMMs with 80ns access time or faster.

Possible RAM configurations are 4MB, 5MB, 6MB, 8MB, 12MB, 20MB, and 36MB.

VRAM

The Performa 460, 466 and 467 have 512K of VRAM soldered to their logic board and have a single VRAM expansion socket. They can be expanded to 768K by adding a single 100ns 256K VRAM SIMM.

System 7 Pro: Description (10/93)

Revised: 10/1/93
Security: Everyone

System 7 Pro: Description (10/93)

==========

Article Created: 4 October 1993

TOPIC ----------

System 7 Pro provides the following software in one package:

- System 7 version 7.1.1
- PowerTalk 1.0
- AppleScript 1.0
- QuickTime 1.6.1

DISCUSSION ----------

System 7 Pro includes everything that's in System 7.1, plus PowerTalk (AOCE collaboration services for individuals), AppleScript (runtime and script editor), and QuickTime 1.6.1. System 7 Pro doesn't replace System 7.1 -— it enhances the functionality of the base system software release.

System 7

System 7 features include:

- Faster access to files and applications with Finder tools such as Find, the Apple Menu, and aliases
- Publish and Subscribe functions for automatic updating of documents
- Support for Apple TrueType technology
- One-button installation

PowerTalk

PowerTalk allows you to correspond and work with others using built-in mail and collaboration services. Use your modem or an AppleTalk network to send messages of any type -- including text, images, video, and sound -- to other System 7 Pro users.

With PowerTalk, you can send items from your desktop by dragging and dropping its icon onto an information-card icon for the recipient. You use this same method whether you're sending the item to other PowerTalk recipients or using access software provided by other vendors to reach fax or other electronic-mail destinations.

Incoming mail items arrive in a single universal desktop mailbox directly on the Macintosh desktop. You can open items, copy them to folders, and otherwise manipulate them as you would any other desktop objects.

PowerTalk also lets you create catalogs of information that facilitate your collaboration with others, from simple address lists to collections of images or sounds.

The PowerTalk "key chain" lets you protect and access your mailbox, AppleShare volumes, and other services using a single access code. Commercial-grade electronic-signature support is provided via PowerTalk's DigiSign software.

PowerTalk features:

- Exchange mail with other PowerTalk users without a server or system administrator.
- Send items with a "drag and drop" of desktop icons.
- Send a single document over multiple delivery mechanisms (fax, electronic mail, and so on) with a single command.
- Use PowerTalk catalogs to organize the information you refer to most often when collaborating with others.
- Implement basic mail services with the AppleMail letter application, which supports text, images, video, and sound.
- Protect your mailbox and other PowerTalk services with a single access code.
- Use DigiSign software to approve documents electronically.
- Use PowerTalk-savvy applications to further automate and extend your messaging capabilities.
- Obtain additional authentication and encryption capabilities with optional PowerShare servers.
- Receive mail from multiple sources in a single desktop mailbox, with an In Tray for viewing and organizing all kinds of correspondence sent to you and an Out Tray for viewing the correspondence you've sent.

AppleScript

AppleScript is a system-level "macro" language that lets you invoke pre-scripted automated tasks.

AppleScript features:

- Automate routine tasks.
- Create custom solutions using off-the-shelf AppleScript-savvy applications.

- Use a consistent scripting language across all AppleScript-savvy applications.

QuickTime

QuickTime is Apple's multimedia technology. It lets you view, copy, and paste video, animations, images, and sound as easily as you manipulate text.

QuickTime features:

- Enables you to edit and play back QuickTime movie files.
- Uses a cross-platform file format that allows playing back Macintosh QuickTime files on Microsoft Windows systems using QuickTime for Windows.
- Offers built-in ability to compress video, animation, and still-image files to a fraction of their original size.
- Supports Kodak's PhotoCD format.
- Lets you import audio files from CDs using an AppleCD 300 or 300i CD-ROM drive and add them to QuickTime movies using the QuickTime standard file-preview dialog box from any QuickTime-compatible application.
- Supports PowerBook systems that have 16-level gray-scale display.

System Requirements

You can install System 7 Pro in any Macintosh computer with 4MB of RAM (5MB of RAM is recommended). System 7 Pro doesn't run on the Macintosh 128, Macintosh 512, Macintosh Plus, or Macintosh XL.

- Apple Macintosh or PowerBook computer with at least 4MB of RAM (5MB recommended)
- Hard disk
- Apple SuperDrive floppy disk drive

Installation

If you already have system software installed on your disk, the System 7 Pro Installer will update it, leaving your existing fonts, desk accessories, extensions, and so on untouched.

Ordering Information

System 7 Pro Personal Upgrade Kit for one user:

- In the U.S., Order Number M0439LL/A
- Outside the U.S., Order Number M0439Z/A

Includes:

- System software version 7.1.1 and utilities
- PowerTalk software version 1.0, including AppleMail and DigiSign software

- AppleScript software version 1.0, including many sample scripts
- QuickTime software version 1.6.1
- What's New in System 7 Pro
- PowerTalk User's Guide
- Getting Started with AppleScript

System 7 Pro MultiPack for up to 10 users:

- In the U.S., Order Number M1271LL/A
- Outside the U.S., Order Number M1271Z/A

Includes:

- System software version 7.1.1 and utilities
- PowerTalk software version 1.0, including AppleMail and DigiSign software
- AppleScript software version 1.0, including many sample scripts
- QuickTime software version 1.6.1
- Macintosh CD Setup software version 4.0.4
- What's New in System 7 Pro
- PowerTalk User's Guide
- Getting Started with AppleScript
- MultiPack Handbook

System 7 Pro: Installation Key Points (9/94)

==========

Article Created: 4 October 1993
Article Reviewed/Updated: 29 September 1994

TOPIC ----------

This article discusses what you need to keep in mind when installing System 7 Pro.

DISCUSSION ----------

Pre-Installation Checklist

- Turn off extensions when you start up by holding the Shift key when you start the Macintosh.

- Turn off all security software and virus- protection software.

- Back up the information on the hard disk.

- Run Disk First Aid.

- Update SCSI drivers if you're updating from System 6 to System 7 Pro.

Compatibility Checker

Run the Compatibility Checker before installing System 7 Pro. If the Compatibility Checker finds incompatible or unknown items in the System Folder of the startup disk, it presents a dialog box that allows you to move those items out of the System Folder. This dialog box lists the items not included in the compatibility database, as well as items that are incompatible.

The dialog box will come up with all items checked for moving. You can click the "Move" or "Don't Move" button. Or you can deselect the items you wish to remain before you click the "Move" button.

If you select "Move," the Compatibility Checker creates a new folder on the hard

disk named, "May Not Work With System 7 Pro," and automatically moves the selected items to this folder. Be sure to follow the instructions in the compatibility report that it generates for you. You can save this report to disk as a text file.

Network Installer

The network install doesn't work the same as previous versions of system software:

- The Installer and Installer Script remain inside the Install Me First folder.

- An alias of both items is outside the Install Me First folder.

800K Installation Disks

If you wish to have 800K installation disks, there's a coupon in the box that you use to send for them.

Common Problems and Resolutions

If the Installer displays a message that your computer doesn't have enough memory, your Macintosh has less than 5MB of RAM. Contact your Apple-authorized dealer for information about how to purchase additional memory.

If the Installer displays the message that it's out of memory, usually it means that the disk cache is set too high. Open the Memory control panel and set your disk cache to the lowest possible setting.

If the Installer displays a message that there isn't enough disk space available, the hard disk has less than the minimum required to use the Installer. Remove some files from the disk to make more space available. Make backup copies of the files, if necessary, then drag them to the Trash. If you're installing from floppy disks, you can also try starting up with the Install disk. This requires less available hard disk space.

AppleCD 300: Connecting to a PC? (10/94)

==========

Article Created: 5 October 1993
Article Reviewed/Updated: 25 October 1994

TOPIC ----------

Is it possible to connect an AppleCD 300 to a MS-DOS PC using a SCSI interface? Are there any drivers available for a MS-DOS PC?

DISCUSSION ----------

While it is technically possible to do this, it is not supported by Apple.

In order to use the AppleCD 300 with a PC, you need:

- The Transtor SCSI card and driver, which are reasonably compatible with the AppleCD 300.
- A utility called MSCDEX that comes with MS DOS 6.0.
- A compatible sound card. Unless you have a sound card, you will not have sound capabilities. Finding a compatible sound card requires testing and some "trial and error" to make it work.

VAX to Mac Special Character Translation On The Fly (9/93)

Revised: 10/4/93
Security: Everyone

VAX to Mac Special Character Translation On The Fly (9/93)

==========

Article Created: 30 September 1993

TOPIC ----------

Is there a way to automatic translate text files created on a VAX with edit/edt, characters like "áéíóúñÑ", to be correctly read on a Macintosh? The configuration is a VAX with PATHWORKS v 1.1, with file transfer being done by copying the text files from a VAXshare volume mounted on the Macintosh desktop.

I know that it can be done via a small program (HyperCard?) looking for the special characters and replacing them for the Macintosh equivalent ones, but this is not as automatic as I want or need. Also I have seen that Mac340 emulation contains a Kermit based file transfer that allows this automatic translation, but this is also not acceptable, because the file transfer should be done via AppleTalk, and using Mac340 (or similar) means extra costs.

DISCUSSION ----------

Digital engineering told us that the only parts of PATHWORKS that currently handle this are NetCopy and FAL in DECnet for Macintosh, and Mail for Macintosh. DECnet allows you to select character translations for the transfer of TEXT files, and Mail does for mail messages. Digital does not have any specific plans to enhance this in the future.

We are also not aware of any other third party software that allows this kind of translation on the fly.

System 7.x: Third-Party Keyboard Startup Difficulties (10/93)

==========

Article Created: 1 October 1993

TOPIC -----

I have a third-party keyboard, and I can't boot with extensions off, nor zap the PRAM.

DISCUSSION -----

First, make sure the Caps Lock key ISN'T depressed.

Second, wait until the Happy Mac appears. The correct key combination has to be held down after the Happy Mac and before the "Welcome to Macintosh" screen. This is usually a one-second window. This is necessary since some third-party keyboards aren't recognized until a few seconds after the Macintosh is turned on.

Quadra 605: Description (10/93) (Discontinued)

==========

Article Created: 21 October 1993
Article Reviewed/Updated: 2 November 1993

TOPIC ----------

This article describes the Macintosh Quadra 605 computer.

DISCUSSION ----------

Overview

The Apple Macintosh Quadra 605 personal computer, Apple's most affordable high-performance desktop system, is an ideal multipurpose personal computer for business and professional users. Like all Macintosh Quadra computers, it puts the highest levels of Macintosh performance and flexibility at your fingertips. Yet the Macintosh Quadra 605 brings the cost of high performance down to almost any budget, and its new, slimline design saves desk space.

The Macintosh Quadra 605 uses the powerful 68LC040 processor, so you can scroll, search, and sort through your applications faster than ever before. You'll also appreciate the speed with which the Macintosh Quadra 605 redraws graphics, recalculates spreadsheets, and reformats large documents. It comes with 4MB of RAM on board, expandable to 36MB, so you can work with multiple applications simultaneously.

Like other Macintosh Quadra computers, the Macintosh Quadra 605 includes many standard features that you pay extra for on other computers -- for instance stereo sound and built-in support for all Apple displays (256 colors) and many third-party displays. With additional video RAM, it can display more than 32,000 colors on 14-inch and 16-inch displays.

The Macintosh Quadra 605 also has built-in networking capability, comes standard with an Apple SuperDrive, and accommodates an 80MB or 160MB internal hard disk. Multiple ports provide direct connection to peripherals such as high-capacity CD-ROM drives, scanners, and modems, so you can

create the system that fits your needs.

As an added advantage, the Quadra 605 is one of the most energy-efficient systems Apple has ever built, and is fully compliant with the Energy Star program of the Environmental Protection Agency.

Power and speed

- 25-MHz 68LC040 microprocessor
- 32-bit data bus

Memory

- 4MB of RAM on board, expandable to 36MB

Displays

- Works with all Apple and many third-party displays
- 256 colors, expandable to 32,768

Expansion

- Slot supports most Macintosh LC II, LC III, and LC 520 expansion cards
- Seven built-in ports for peripherals

Usability

- Runs thousands of Macintosh applications
- Easy to set up, learn, use, and expand

System software

- System software version 7.1 with multitasking, file sharing, QuickTime, Balloon Help, TrueType, and more

Networking

- Built-in AppleTalk networking
- File sharing without a dedicated server

Compatibility

- Reads Macintosh, MS-DOS, OS/2, and ProDOS floppy disk formats

Ordering Information

- M1821LL/A - Macintosh Quadra 605 with 4MB RAM, 512K VRAM, and internal 80MB hard disk drive.

Macintosh Quadra 605: Specifications (8/95)

==========

Article Created: 21 October 1993
Article Reviewed/Updated: 22 August 1995

TOPIC ----------

This article gives technical specifications for the Macintosh Quadra 605 computer.

DISCUSSION ----------

Microprocessor

- MC680LC40, 25 MHz clock speed, logic board clock 25 MHz; 32-bit data bus
- Integrated Paged Memory Management Unit (PMMU)

Memory

- Comes with 4MB of RAM on the logic board
- Expandable to 36MB by adding one SIMM to a single 72-pin slot
- Includes RAM disk software

Disk drives

- One built-in Apple SuperDrive 1.4MB floppy disk drive
- One internal 80MB or 160MB hard disk
- Optional external hard disk drive
- Optional external AppleCD CD-ROM drive

Video display

Supports several displays, including:
- Macintosh 12-inch Monochrome Display
- Macintosh 12-inch RGB Display
- AppleColor High-Resolution RGB Display (13-inch)
- Macintosh Color Display (14-inch)
- Macintosh Portrait Display (15-inch)

- Macintosh 16-inch Color Display
- Third-party monitors
- VGA monitors

Video RAM (VRAM)

- Standard 512K VRAM supports 8-bit color for display of 256 colors on monitors up to 16 inches.
- Additional 512K VRAM provides 16-bit color for display of thousands of colors on monitors up to 16 inches

- 512K standard supports:
  - 32,768 colors on the Macintosh 12-inch RGB Display
  - 256 colors on the AppleColor High-Resolution RGB Display (13-inch), Macintosh Color Display (14"), and Macintosh 16-inch Color Display
  - 256 shades of gray on the Macintosh 12-inch Monochrome Display
  - 16 shades of gray on the Macintosh Portrait Display (15-inch)
  - 16 colors on the Macintosh 21-inch Color Display
  - 16 shades of gray on the Two-Page Monochrome Display

- 1MB option supports:
  - 32,768 colors on the Macintosh 12-inch RGB Display, AppleColor High-Resolution RGB Display (13-inch), Macintosh Color Display (14-inch), and Macintosh 16-inch Color Display
  - 256 shades of gray on the Macintosh 12-inch Monochrome Display and Macintosh Portrait Display (15-inch)
  - 256 colors on the Macintosh 21-inch Color Display
  - 256 shades of gray on the Two-Page Monochrome Display

Interfaces

- One Apple Desktop Bus (ADB) port for a keyboard, mouse, and other devices
- SCSI interface for connecting up to six external peripheral devices
- Two serial (RS-232/RS-422) ports
- One video port for color and monochrome displays of various sizes and resolutions
- Sound-output port (stereo) for external amplifier or headphones
- Slot for most expansion cards that are compatible with Macintosh LC II, LC III, and LC 520 Processor Direct Slots.

Networking

- Built-in AppleTalk port

Sound Input*

- Sound input port for monaural sound input (monaural 8-bit sound, sampled at 22 or 11 kHz)

*NOTE:
The Apple PlainTalk Microphone, which is sold as a standalone product, is compatible with these systems. These products can not use the older style

low-level output microphone used on previous Macintosh models.

Keyboard and Mouse

- Several ADB keyboards with numeric key pads available
- Apple Desktop Bus Mouse II

Clock/Calendar

- Custom integrated circuit with long-life lithium battery

Disability Access

- CloseView, Easy Access, and visible-beep software are built in.
- Third-party options provide alternative input and output devices

Power Requirements

- Line voltage: 90 to 240 VAC, RMS single phase, automatically configured
- Frequency: 50 to 60 Hz
- Power: 30 watts maximum, not including display power
- EPA Energy Star compliant

ADB Power Requirements

- Maximum current draw for all ADB devices: 200 mA (three ADB devices maximum is recommended)
- Mouse draws 80 mA
- Keyboard draws 25 to 80 mA (varies with keyboard model used)

Size and Weight

Main unit:

- Height: 2.9 inches (7.4 cm)
- Width: 12.2 inches (31.0 cm)
- Depth: 15.3 inches (38.8 cm)
- Weight: 8.8 pounds (4.0 kg) (varies based on internal devices installed)

Mouse:

- Height: 1.3 inches (3.3 cm)
- Width: 2.4 inches (6.2 cm)
- Depth: 4.2 inches (10.7 cm)
- Weight: 4.0 ounces (0.10 kg)

Operating Environment

- Operating temperature: 50 to 104 F (10 to 40 C)
- Storage temperature: -40 to 116.6 F (-40 to 47 C)
- Relative humidity: 20% to 80% noncondensing
- Maximum altitude: 10,000 ft. (3,048 m)

System Software Requirements

Requires System 7.1 or later and System Enabler 065.

What's Included

Software included: System Software 7.1, QuickTime 1.6.1, HyperCard Player 2.1, Macintosh Basics 4.2 and MacCheck 1.0.4.

Documentation included:
- Getting Started with your Macintosh Quadra 605
- Macintosh User's Guide
- Technical Specifications for your Macintosh Quadra 605

Article Change History:
22 Aug 1995 - Added compatibility information on PlainTalk microphone.
18 Mar 1994 - Added "Macintosh" to title.
01 Mar 1994 - Added Two-Page Monochrome Monitor to Video RAM Section.

Quadra 840AV: Screen Fax Displays As If Selected (12/94)

Revised: 12/14/94
Security: Everyone

Quadra 840AV: Screen Fax Displays As If Selected (12/94)

==========

Article Created: 4 October 1993
Article Reviewed/Updated: 14 December 1994

TOPIC ----------

I have a Quadra 840AV. When my Quadra 840AV received a Fax it was displayed on the monitor with a black background with white text (just the reverse of the plain paper Fax). Is there a command for switching the background color on the display from black to white?

DISCUSSION ----------

No, there is no command to switch the background color. This is a known problem where the display is affected. If the Fax is printed out, it will print correctly, however, sometimes, it prints in inverse video. This problem also occurs on Power Macintosh computers.

To resolve this problem you should upgrade to Express Modem 1.5.5 software. These articles can help you locate Express Modem 1.5.5 software mentioned here:

- "Where To Find Apple Software Updates"
  Lists online services for "free" Apple software updates.

- "Obtaining Apple Product Support in the USA"
  Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library.

Article Change History:
14 Dec 1994 - Added Express Modem 1.5.5 and where to obtain it.
29 Sep 1994 - Added Power Macintosh and problem with Fax, but not screen.

Apple Modem Tool 1.5: Third-party Modem Compatibility (10/93)

Revised: 10/6/93
Security: Everyone

Apple Modem Tool 1.5: Third-party Modem Compatibility (10/93)

==========

Article Created: 6 October 1993

TOPIC -----

Recently, I installed the version of Apple Modem Tool 1.5 which was included in the Newton Connection Kit 1.0. After installation, I wasn't able to use a third-party modem to connect my Macintosh to another computer. When I try to connect, I get the message "The connection settings are invalid. Please reset your modem..."

Why is this?

DISCUSSION -----

Apple Modem Tool 1.5 that is distributed with the Newton Connection Kit 1.0, is compatible with other modems than Apple and Hayes-compatible modems. This version of Apple Modem Tool 1.5, however, doesn't ship with a list of other modems' command strings; it only offers the choice of Hayes-Compatible, Custom, and a group of different Apple modems.

The workaround is to create a custom configuration for your modem. To do so, follow these steps:

1) Choose Connection from the Settings Menu.

2) In the lower-left corner of the Connection Settings dialog are the Modem Settings options. Scroll doen the list and select Custom.

3) Enter your "Custom Modem Configuration" (Refer to your modem user manual or contact the manufacturer of the modem should you need help in determining the proper command string to use.)

Your modem should now operate properly.

LaserWriter 8.0: Global Village Incompatibility (5/95)

Revised: 5/24/95
Security: Everyone

LaserWriter 8.0: Global Village Incompatibility (5/95)

==========

Article Created: 4 October 1993
Article Reviewed/Updated: 24 May 1995

TOPIC ----------

I have a Global Village fax modem on my PowerBook. I'm constantly getting Type 1 errors. I've done a clean install of system software, and ran Disk First Aid. When I fax using the Global Village software it goes through, but then the document becomes corrupted. This doesn't happen with the LaserWriter driver 7.2, only with the 8.0 driver.

DISCUSSION ----------

This is a known problem and has been fixed in the LaserWriter driver version 8.1.1 and all LaserWriter drivers released after v8.1.1.

Article Change History:
24 May 1995 - Added information on later LaserWriter drivers.

Forwarded Mail: Appears to Lose Enclosures (10/93)

Revised: 10/5/93
Security: Everyone

Forwarded Mail: Appears to Lose Enclosures (10/93)

==========

Article Created: 4 October 1993

TOPIC --------------------

Mail forwarded from within an application, like AppleMail, may appear to lose enclosures when the recipient opens the document. A paper clip may appear in the upper right corner of the standard mail, while the enclosure window displays nothing.

DISCUSSION --------------------

Actually the enclosure is in the mail, though in a different layer. By clicking the turned edge at the bottom left corner of the standard mailer, you can find enclosures in the original addresses mailer.

Also, a popup menu (triangle) appears to the right of the "From" field. This popup menu lists names of all forwarding individuals. A paper clip may appear beside some names in the popup menu indicating an enclosure. Selecting names from the popup menu allows instant access to the standard mailer page addresses.

AppleTalk Internet Redesign (10/93)

==========

Article Created: 5 October 1993

TOPIC -----

I have an internet redesign issue. I'm concerned about my strategy to update the router definitions in my network.

Is it possible for the router/zone updating process to propagate bad zone information after it is changed? If I update a zone list on a router is the old table kept in other routers and forwarded as a part of normal updating therefore maintaining this bad zone information? What exactly prevents this from happening if anything?

What phenomenon on the network would cause ZIP storms between routers?

If I am changing my Internet wide zone lists what strategy should I follow in updating the routers? Do I need to isolate each while I change it and prevent it communication with others until they are all updated? If this isn't possible do I have other choices?

Is it possible for normal RTMP updating between routers to propagate bad network number entries that keep "updating around the network" when they no longer describe a valid network entry? This assumes a router is redefined to have a different network number setup for the ports that it seeds.

There is also a problem with zone names and zones appearing/disappearing in the chooser.

I have a 6000 node network with hundreds of subnets. I want to change my network zone tables from one that reflects a physical layout to a logical one, but I'm concerned about how to implement a ZIP change on a subnet when routers may be propagating bad zip information behind the changes for old entries.

DISCUSSION -----

The Zone Information Protocol (ZIP) does not support dynamic network changes. The prescribed method of updating a zone list is to temporarily isolate the changing network from the internet, shut down all routers directly connected to the changing network, and change the zone list in each of the seed routers. Inside AppleTalk recommends the routers remain down for approximately 10 minutes to allow the old zone list to age out of all the other routers in the internet before being started again. If this procedure is not followed, it is possible for old zone information to be propagated after a change is made (depending on the complexity of the change, this could cause ZIP storms between routers).

Inside AppleTalk alludes to a "future network management protocol" that would provide the capability of changing the zone list of a network while that network is active as a part of the internet. Unfortunately, such a protocol hasn't been developed yet, so the aforementioned procedure is the only way to properly implement a network change.

The Routing Table Maintenance Protocol (RTMP) would only be temporarily impacted by a network change. The old network table entries would time out and get deleted as the routers on the internet no longer heard from the "old network" (Inside AppleTalk indicates this should take approximately 60 seconds).

AppleShare 3.0.3 Patch & Print Server Versions (10/93)

Revised: 10/6/93
Security: Everyone

AppleShare 3.0.3 Patch & Print Server Versions (10/93)

==========

Article Created: 5 October 1993

TOPIC -----

If I'm not mistaken, if you have Print Server 3.0 and you run either the 3.0.2 or 3.0.3 patch, there will not be any code changes made to the print server however installing the patch will update the version number to 3.0.2 or 3.0.3 respectively. You effectively still have Print Server 3.0, meaning the code fixes in 3.0.1 are not present.

DISCUSSION -----

Installing the AppleShare 3.0.3 patch DOES NOT change the version number of the AppleShare Print Server. The version number on the Admin program and the File Server are upgraded but the Print Server is not changed.

System Enablers: Are Performa & Mac Enablers Compatible? (10/93)

Revised: 6/28/94
Security: Everyone

System Enablers: Are Performa & Mac Enablers Compatible? (10/93)

==========

Article Created: 6 October 1993

TOPIC ----------

Are the system enablers for similar Macintosh and Performa computers (such as the Macintosh LC III and the Performa 450) compatible?

DISCUSSION ----------

No, they are not compatible. You should not use Performa enablers with the Macintosh operating system or Macintosh enablers with the Performa operating system, since a particular system enabler may not have system resources that the other operating system needs.

Also, do not put a Performa enabler and a Macintosh enabler for a similar machine in the same System Folder, since this may cause unpredictable results.

PowerBook: Using SCSI Devices (2/97)

Revised: 2/12/97
Security: Everyone

PowerBook: Using SCSI Devices (2/97)

==========

Article Created: 6 October 1993
Article Reviewed/Updated: 12 February 1997

TOPIC

All PowerBook computers that have been released to date, with the exception of the PowerBook 200 Series, have an integral SCSI port. The PowerBook 200 Series computers must be attached to a Dock of some kind to gain that port. This article describes adding peripheral devices to your PowerBook and also using SCSI Disk Mode, which lets some PowerBook computers connect to a desktop Macintosh and appear as an external hard disk.

DISCUSSION

The SCSI Port and Cabling

The SCSI port used in the PowerBook series is called an HDI-30. It is a square socket SCSI connector with 30 pins. There are two different SCSI cables. In addition to one of these cables, you may need a terminator, model number M3503LL/A.

Apple HDI-30 SCSI Disk Adapter

This adapter, model number M2539LL/A is specifically for SCSI Disk Mode. It can be distinguished by its HDI-30 connector having 30 pins (5 rows of 6). The connector on the other end is a standard Centronics 50 socket connector.

Apple HDI-30 SCSI System Cable

This cable is for connecting external SCSI devices, like CD-ROMs and hard drives, to your PowerBook and it is called the Apple HDI-30 SCSI System Cable, model M2538LL/A. Its HDI-30 connector only has 29 pins. The connector on the other end is a standard Centronics male.

SCSI Disk Mode

This mode lets your PowerBook be connected to a desktop Macintosh and appear on that machine as an external hard disk. This mode is supported on all PowerBook models with the exception of the 140, 145, 145B, 150, and 170 and is recommended for high speed transfer of information, but is not necessarily intended for long-term usage. Follow these steps to setup SCSI disk mode:

Step 1

In the PowerBook control panel (Portable control panel for the 100) choose the SCSI ID for the PowerBook. Remember, each SCSI device must have a unique ID number. Verify that the hard drive name for the PowerBook is different from the hard drive name of the target machine.

Step 2

Shut down the PowerBook and any additional SCSI devices in the SCSI chain. Attach the HDI-30 SCSI Disk Adapter cable to the PowerBook and a terminator at the other end (the terminator may not be required). If you find that the main computer does start up properly, turn both computers off, remove the terminator and then restart the systems.

Step 3

Plug the SCSI Disk Adapter cable to either a SCSI cable attached to the desktop Macintosh, or to any existing SCSI device on the SCSI chain.

Step 4

Power on the PowerBook and you should see a diamond shaped symbol moving across the screen with a number corresponding to the SCSI ID you set. Once you see that, power on the desktop machine. After that machine boots up, you should see the PowerBook's hard drive appear on the screen of the desktop Macintosh.

To end the session, shut down the desktop Macintosh, then power off the PowerBook by either pressing and holding the power switch for two seconds then releasing, or, for the PowerBook 100, press both of the buttons on the left side of the unit.

NOTE: The Macintosh Plus and the Macintosh SE without an internal Hard Disk can be used with SCSI disk mode. Also, you can dock to another PowerBook (of any kind). When attaching under these configurations, you do NOT use the terminator between the two SCSI cables.

Adding External Devices

There are many devices that use the SCSI port to connect to your PowerBook. Some examples are Hard Disks, CD-ROM drives, backup devices, video expansion, and Ethernet connections.

The most important thing to keep in mind when adding devices to a SCSI chain is the ID number. The SCSI chain has an ID range from 0 to 7. ID 7 is reserved for the PowerBook itself; ID 0 is reserved for the internal hard drive. The other 6 ID numbers are for external devices. Generally, this ID can be set on the device by some external selector -- consult the manual for the device to see how to set this number. The ID number for each device must be unique on the chain, that is, only one device can use a given number.

A SCSI device chain must be terminated at both the beginning and end. PowerBook computers require additional termination at the end of a SCSI chain.
Because of this you need to add a second terminator to the last device in the chain, unless that device has termination built in. If there is only one external SCSI device, it needs two terminators, one for itself and one for the PowerBook.

If there is more than one external SCSI device connected in a chain to a PowerBook computer, they can be connected together using the Apple SCSI Peripheral Interface Cable. This cable is a Centronics 50 pin to 50 pin cable. Both the first and last device in the chain need one terminator each, unless one or more of the devices in the chain have termination built in.

Some older SCSI devices are internally terminated. If you are not sure, it is very important that you check the manual for each device. When creating a SCSI chain for the PowerBook, you want a terminated device at the beginning of the chain, and another at the end. If any of the devices in the middle are terminated, you will have difficulties seeing all the devices.

Before connecting or disconnecting devices on a SCSI chain, turn the power off for all devices. When you get ready to power up, turn on all external devices first, then turn on the PowerBook. When you wish to end the session, shut down the PowerBook first, then turn off all the devices.

Common Problems Q&A

Question: I am attempting SCSI Disk Mode, and the PowerBook does not display the diamond pattern. What is wrong?

Answer: First, make sure you are using the correct cable. This is the most common problem. Refer to the previous Cabling section to verify that you are using the SCSI Disk Adapter cable. Second, be aware that SCSI Disk Mode is only supported in certain PowerBooks. Review the instructions under SCSI Disk Mode to see which PowerBooks are supported.

Question: I have added an external SCSI device to my PowerBook and when I start up, I get a diamond symbol on my screen. What does this mean?

Answer: You are using the Disk Adapter Cable instead of the System Cable. See the preceding section on Cabling to see the difference.

Question: I have added an external SCSI device to my PowerBook and when I start up, I only get a flashing question mark (?) over a disk icon. Why?

Answer: Something is preventing your Hard Disk from starting up correctly. First try and start your computer from its Disk Tools disk. If it starts up, and your hard drive does not show up on the desktop, you may have a SCSI ID conflict. Make sure that the external device is set to an ID number from 1 to 6, and if more than one device is connected, make sure each has a unique ID number. Try opening the Apple HD SC Setup program on the Disk Tools disk. If that program can see your hard drive, try selecting the update button.

This updates the driver software on the Hard Disk. Check the version of the Apple HD SC Setup application. It is possible that a newer version is available which may address your problem. Make sure you are configuring your SCSI chain correctly, refer to the previous section, paying close attention to termination.

Question: In SCSI Disk Mode, the desktop computer tries to start up from the PowerBook’s drive, rather than its own internal drive. An example is an error message such as the one saying the system software is not correct for this Macintosh. What should I do?

Answer: Power the desktop computer off, and then start up from the Disk Tools disk for that computer. Make sure that both the PowerBook drive and the desktop's internal drive both show up on the screen. Verify that the names of the two drives are different. Open the Startup Disk Control Panel and verify the desktop computer is selected. Restart and let the Disk Tools disk be ejected, it should then start up from the correct drive.

LaserWriter 8 Printer Driver Version 8.1.1 (2/95)

Revised: 2/10/95
Security: Everyone

LaserWriter 8 Printer Driver Version 8.1.1 (2/95)

==========

Article Created: 4 October 1993
Article Reviewed/Updated: 9 February 1995

TOPIC ----------

This document contains important information about the LaserWriter 8 printer driver version 8.1.1. The new printer driver is more compatible with Apple printers and non-Apple software than earlier versions of the LaserWriter 8 printer driver.

DISCUSSION ----------

Before Installing Printer Driver Software

Before you install LaserWriter 8 software, check the information below about which files in your System Folder will be replaced with newer versions when you install, and what steps you might want to take to keep or remove files:

If You Use System 6

If you use System 6, you may want to make backup copies of your original PrintMonitor and Backgrounder to use if you need the option of sometimes using an older version of LaserWriter driver. (The Installer automatically replaces your original PrintMonitor and Backgrounder with newer versions.)

Drivers Older Than Version 8.0

The Installer doesn't replace versions of the LaserWriter driver that are older than version 8.0. You may remove printer driver files that are older than version 8.0 from your System Folder if you no longer need them.

Drivers For Versions 8.0 or Later

The Installer does remove earlier versions of the LaserWriter 8 driver (for example, version 8.0) and all Apple PostScript Printer Description (PPD) files.

The Installer Places These Files

For System 6, in your System Folder: LaserWriter 8 (version 8.1.1), PrintMonitor (version 7.0.1), Backgrounder (version 1.3), LaserPrep (version 7.2). The Installer also places PPD files for Apple LaserWriter printers in the Printer Descriptions folder in your System Folder.

For System 7, in the Extensions folder: LaserWriter 8 (version 8.1.1), PrintMonitor (version 7.1). It also installs the latest PPD files for Apple LaserWriter printers in the Printer Descriptions folder in your Extensions folder.

NOTE: Some files on the LaserWriter 8 disks have been compressed (their filenames end with .cmp). You can only install these files with the LaserWriter 8 Installer.

The Installer does not copy the LaserWriter Utility to your computer. You may install the utility by dragging it to your hard disk.

About PPD Files

The LaserWriter 8 printer driver is shipped with PPD files that contain information about specific features of LaserWriter printer models. These files are in the Printer Descriptions folder. PPD filenames indicate the printer model and its version of PostScript.

To take full advantage of your printer's features, follow these tips:

• Select your printer in the Chooser and click the Setup button.

• Click the Auto Setup button in the Setup dialog box. The correct PPD file for your printer is automatically selected.

• If the driver can't find a PPD file that matches your printer, you will be prompted to select one. You may select the generic PPD file, which will work with all LaserWriter printers.

About Creating EPS Files

You can create an Encapsulated PostScript (EPS) file in many applications programs by clicking File in the Print dialog box, then clicking Save. When you create an EPS file, note the following:

Creating EPS Files

Creating EPS files with the All option selected in the Font Inclusion pop-up menu in the EPS dialog box can result in very large files. If you include all fonts in an EPS file and save the file with the Unlimited Downloadable Fonts

option selected, an extremely large file may be created.

EPS File With No Fonts

If you create an EPS file with no fonts included and open the document, fonts in the document appear on your screen, but Courier may be substituted when you print.

EPS Files With Preview Information

When creating EPS files with preview information included, applications that create their own PostScript code may not display the EPS file accurately on the screen.

Using the LaserWriter 8 Driver

When using the LaserWriter 8 driver, you should be aware of the following situations. Some happen with all LaserWriter printers and others happen only with specific models.

All LaserWriters

The LaserWriter 8 driver allows some printers to print using a larger imageable print area on the page. If your printer does so, you may find that text in some documents reflows or is clipped to fit the new imageable area.

If you print using A4 size paper, have chosen Manual Feed as the Paper Source, and have a B5 size paper tray installed in your printer, the page will be clipped to match the B5 paper size.

Printing multiple documents with the Finder may not work if the documents have been created by different application programs.

LaserWriter IIg and IIf

When selecting paper sources from the First From and Remaining From pop-up menus in the Print dialog box, selecting Manual Feed for either source sets the driver to print the first page from the manual feed tray.

Some form-printing applications can't print forms using the Layout settings in the Page Setup dialog box.

LaserWriter IINT and IINTX

If you select both the Smooth Graphics and the Invert Image options in the Page Setup Options dialog box, a PostScript error results.

Don't use the B5 tray to print envelopes on a IINT. Use the Letter tray instead.

LaserWriter Pro 600 and 630

You can't use Auto Select as the Paper Source in the Print dialog box to print envelopes from the optional envelope feeder.

When you are printing at 600 dots per inch (dpi), bitmapped images may appear with lines across the image.

Personal LaserWriter NTR

When you are printing in the background, no message appears when the printer runs out of paper.

LaserWriter Pro 810

With some graphics applications, bitmap graphics will be reduced by 25% in size when Precision Bitmap Alignment is specified.

Using the LaserWriter 8 Driver with the Kanji System

To print Japanese characters using KanjiTalk or the Japanese Language Kit, your system must have WorldScript II 7.1.1.

Using the LaserWriter 8 Driver with Application Programs

Some application programs don't yet take advantage of the new features of the LaserWriter 8 driver, or have small incompatibilities that result in printing problems. If you experience problems with a program, contact the publisher of the program. In some cases a newer version of the program may be available.

The following list describes some special cases that you should be aware of when working with some application programs. (There may be other problems with these programs, or with other programs, not mentioned in this document.)

Aldus Freehand 3.11

You can't print using Layout options in the Print dialog box. If you choose a layout from the Layout pop-up menu, the document doesn't print and no error message appears.

EPS files created from within Freehand can't be used in other programs.

Selecting the Unlimited Downloadable Fonts option in the Page Setup Options dialog box results in a PostScript error.

Aldus PageMaker 4.2a

You can't scale EPS images in documents printed using the Layout option in the Page Setup dialog box.

Aldus Personal Press 2.0

Using several font style combinations in text can result in spacing problems.

When working with large EPS files in a document, you may need to increase the amount of memory allocated to the application.

Aldus Persuasion 2.1.2

When you print a document that contains gradient fill patterns, the document is printed with solid patterns instead of gradients.

Documents that contain EPS graphics may not print correctly if you select 2-Up or 4-Up printing.

Aldus SuperPaint 3.0

Rotated or filled polygons print as solid gray objects.

Canvas 3.0.6

Printing with substituted fonts may result in incorrect line layout.

CricketDraw III 1.0

You can't import an EPS file created with the LaserWriter 8 driver that has been saved without preview information.

Be sure that enough space is available on your hard disk when printing large documents; otherwise the application may malfunction.

CricketPresents 2.1

You can't import an EPS file created with the LaserWriter 8 driver that has been saved without preview information.

Informed Manager 1.3.5

Shaded headings in a document may not print correctly.

Some documents will print with extra pages.

MacDraft 2.1

When you print using the Cut Marks option, a PostScript error results.

Microsoft PowerPoint

In PowerPoint version 2.01f, you can't import an EPS file created with the LaserWriter 8 driver that has been saved without preview information.

When importing EPS files, you may want to increase the memory allocated to the application.

Microsoft Works 3.0

Printing documents that have rotated objects with rounded corners results in a PostScript error.

More 3.1

When creating EPS files with the LaserWriter 8 driver, be sure you have enough disk space to hold the file. No Disk Full error message appears when your hard disk becomes full and can't hold the entire file.

Publish It! Easy 2.1.9

Use an earlier version of the driver, or contact the publisher of the application program.

QuarkXPress 3.11

You can't print EPS files created by the LaserWriter 8 driver that contain certain TrueType fonts.

Using Calibrated Color results in a PostScript error.

ReadySetGo! 4.5 and 5.0 (DesignStudio)

Use an earlier version of the driver, or contact the publisher of the application program.

Studio/8 and Studio/32

When creating an EPS file with these programs and the LaserWriter 8.0 driver, you must select the QuickDraw Printer option.

Other Troubleshooting Tips

Printer Status Dialog Boxes

When you are printing with some application programs, the Printer Status dialog boxes may appear overlapping or misaligned on the screen, preventing you from canceling printing by clicking the Cancel button. Press Command-Period to cancel printing.

Unexpected Format Results

If you see unexpected format results when you print a document, choose Page Setup and check whether the paper size is shown as Other. If so, select the correct paper size.

Utility Programs That Change Your Printer Without The Chooser
---

Utility programs that attempt to change your current printer without using the Chooser may produce unexpected results.

Cover Page May Not Print

With some graphics applications, the Cover Page may not be printed at the end of a multi-page document. Use Cover Page: Before Document.

AppleScript: How to Use on AV Computers (10/93)

==========

Article Created: 4 October 1993

TOPIC -----

Is there any information about using speech to control common, non-menu based Finder commands (jumping from one icon to another, and so on)?

What resources are available for customers to use AppleScript?

DISCUSSION -----

Regarding scripting non-menu based Finder commands, there are two options currently available:

- The AppleScript Developer's Toolkit provides instructions on using "finderLib", a script library providing routines which script the System 7.0 and System 7.1 Finder.

- Use the QuicKeys Test Drive which ships with AV Macintosh computers, which would allow you to use speech to control QuicKeys of Finder commands (that is, assign QuicKeys to arrow keys to "jump from one icon to another").

Of course the best solution will be when Apple releases a fully scriptable Finder (without having to use "finderLib").

In the meantime, one of the best sources of AppleScript information is the AppleScript Developer's Toolkit, available from APDA, product number R0175LL/A.

Software Utilities Update 1.0.1: How It's Different from 1.0

Revised: 10/25/93
Security: Everyone

Software Utilities Update 1.0.1: How It's Different from 1.0

==========

Article Created: 8 October 1993
Article Reviewed/Updated: 25 October 1993

TOPIC ----------

This article tells you what's been changed in version 1.0.1 of the Software Utilities Update.

DISCUSSION ----------

The Software Utilities Update version 1.0.1 includes:

- HD SC Setup version 7.2.2
  This version of HD SC Setup gives you more flexibility to format large Apple hard disks between 1 and 2 gigabytes.
- A revised ReadMe file for Software Utilities Update
- Revised ReadMe file for MacCheck

Here's a list of files found on Software Utility Update:

File Name	Version #
Apple HD SC Setup	7.2.2
Disk First Aid 7.2	7.2
MacCheck dataFile	1.0.4
MacCheck Read Me	
MacCheck User Guide.msWrd	
MacCheck User Guide.mwII	
MacCheck	1.0.4
Software Utility Update Read Me	
TeachText 7.1	7.1

NOTE: You should update your hard drive drivers and also update the version of this utility that is on your System 7.1 "Disk Tools" disk. If you've already updated using Apple HD SC Setup version 7.2 (from either the Macintosh Software Utility Update 1.0 or Hardware System

Update 2.0), you should still update to version 7.2.2. You can obtain the update from Apple resellers, AppleLink or other on-line services.

Article Change History:
25 October 1993 - Added list of files on the Software Utilities Update, and a note to update the drivers.

MacCheck 1.0.4 Read Me (2/94)

==========

Article Created: 8 October 1993
Article Reviewed/Updated: 22 February 1994

TOPIC ----------

The ReadMe file for MacCheck is in the Discussion section of this article.

DISCUSSION ----------

This ReadMe document contains information about the MacCheck program. The Microsoft Word and MacWrite II documents, "MacCheck User Guide.msWrd" and "MacCheck User Guide.mwII" are a superset of this document and provide easier to read (better formatted and highlighted) text, along with more technical details about the inner workings of MacCheck.

I. INTRODUCTION TO MACCHECK

MacCheck is an Apple support utility tool with which you can learn more about your Macintosh computer, as well as diagnose software problems that result from corrupted directories and files. By using MacCheck in conjunction with Disk First Aid, you can resolve common disk corruption problems.

MacCheck creates a profile of your Macintosh computer, including:

- The processor, memory, expansion cards, SCSI drives, keyboard, monitor, and so on
- The installed applications and system software on your startup drive

MacCheck also provides:

- A general logic board test
- A checker for the file system and System files
- A checker for duplicate System Folders

The MacCheck product consists of the application file "MacCheck," and the data file "MacCheck dataFile." For MacCheck to work correctly, both the application file and the data file must be located in the same folder. MacCheck is compatible with System 7.0 or later.

Under most circumstances, MacCheck can be run with extensions on. However, if you are having trouble running MacCheck, you should turn extensions off (by restarting your computer while holding down the Shift key). MacCheck does conflict with some non-Apple extensions:

- Thunder 7
  Don't run MacCheck while Thunder 7 is active. MacCheck and Thunder 7 have serious conflicts.
- Virus protection programs
  You'll need to "teach" some virus protection programs about MacCheck.
- Electronic mail programs
  Sometimes when electronic mail programs, such as Microsoft Mail or QuickMail, are active, they disrupt the file system checking by making your startup volume "busy".

II. MACCHECK OVERVIEW

Launching MacCheck

When you launch MacCheck, you'll see a splash screen detailing the initialization processes that MacCheck performs while it starts up. During most of this time, MacCheck gathers profile information and checks for multiple System Folders. On a new Macintosh LC III, MacCheck takes about 1 minute to launch; on a 400MB, 8,000-plus-file Macintosh Quadra 950, it takes about 4-5 minutes to launch.

Note: If you want to speed up the launch process by about 20 seconds, press the Space bar when the splash screen first appears. This tells MacCheck not to profile modems or check SCSI devices that are typically slow, such as DAT tape drives. MacCheck will display a "•QuickBoot•" message. If you wish to quit the launch process at any time, press command-period.

Accessing Profile Information

MacCheck stores the collected profile information in three log files, the "System Info," "Additional System Info," and "Application and Font Info" logs. To view the profile information placed into these logs, select the log you want from the Windows menu.

Starting Logic Board and File System Tests

To start the logic board and file system tests, click the Test button or select the Test option (command-G) in the Diagnostics menu. When these tests are completed, MacCheck stores the results in a results file. The default name of this file is "Test Results-1". You may rename this file by selecting the Save Results As option in the File

menu.

System 7 Pro 7.1.1: Macintosh AV Systems Alert (3/94)

Revised: 3/25/94
Security: Everyone

System 7 Pro 7.1.1: Macintosh AV Systems Alert (3/94)

==========

Article Created: 7 October 1993
Article Reviewed/Updated: 24 March 1994

TOPIC ----------

An incompatibility has been discovered when running PowerTalk 1.0 on a Macintosh Centris 660AV or Macintosh Quadra 840AV system. The incompatibility can result in performance degradation and/or possible B*Tree corruption.

DISCUSSION ----------

One problem occurs when users exchange a Business Card (or Personal Catalog) between a non AV Macintosh and an AV system. The Business Card (Personal Catalog) will be damaged when opened on the AV system. PowerTalk has a built-in repair function, but a user confirmation dialog will be brought up every time such repair takes place.

Before installing System 7 Pro on Quadra 840AV or Centris/Quadra 660AV, make sure you have System Enabler 088 1.0.1 or later installed.

Version 1.0.1 (or later) of System Enabler 088 is currently available in Apple SW Updates, on AppleLink.

Article Change History:
24 Mar 1994 - Made visible to public, and updated enabler version information.

CopyDoubler: System 7 Pro Incompatibility (10/93)

==========

Article Created: 4 October 1993
Article Revised/Updated: 23 November 1993

TOPIC --

The System 7 Pro 7.1.1 Compatibility Checker reports that CopyDoubler 2.0.1 is compatible, but it should be listed as just "mostly compatible."

CopyDoubler 2.0.2 is compatible with System 7 Pro 7.1.1.

DISCUSSION --

If you have CopyDoubler's "Fast Empty Trash" enabled, it won't let you empty the trash if Apple Mail items have been thrown away. This also causes a crash about half the time.

We've reported this problem to Fifth Generation Systems.

Article Change History:
23 November 1993 - added that 2.0.2 is compatible

GeoPort and Extensions Manager (10/93)

Revised: 10/14/93
Security: Everyone

GeoPort and Extensions Manager (10/93)

==========

Article Created: 8 October 1993

TOPIC ----------

If I install Extensions Manager 2.0, turn all of my extensions or the Express Modem control panel off, and then restart, the Express Modem control panel will be corrupted. It will come up black when extensions are loading if it is turned back on with Extension Manager. The only way to get it back is to reinstall the GeoPort software.

DISCUSSION ----------

We did some testing with this and believe we have discovered the problem. This is not really a software conflict but rather a customer-usage issue.

We did a lot of testing with the GeoPort and the Extensions Manager and the only way I could get the problem, where the "phone turned black" and the Express Modem was unusable, was:

- To have turned off the Extension Manager's own extension, EM Extension, when the other extensions were turned off.

- NOT to turn it back on when the other extensions were turned on.

If the Express Modem was turned off, with and without turning off its own extensions, we could always get it turned on successfully -- as long as the EM Extension was not turned off and left off.

The key to knowing whether the EM Extension is off, is to check where the Extensions Manager icon loads at boot. If it shows before the other extensions, then it is on; if instead it shows after the extensions and before the Express Modem icon, then it is off, and the phone will go black. Then yes, the only way to get the Express Modem back and functional is to reinstall the GeoPort software.

So, in summary, the key is to NOT turn off the EM Extension (equals don't

turn off all extensions unless you really have to). If you do have to turn it off, BE SURE to turn it on in the Extensions Manager Control Panel BEFORE rebooting! Having the Extensions Manager half on/off is the actual problem.

Freehand 3.1, Sys 7.1, Quadra 700 & 950: Use System Update 3.0

Revised: 9/13/95
Security: Everyone

Freehand 3.1, Sys 7.1, Quadra 700 & 950: Use System Update 3.0

==========

Article Created: 15 October 1993
Article Reviewed/Updated: 13 September 1995

TOPIC ----------

I am having problems working with Aldus Freehand 3.1. The first time I create a document, it works fine. If I edit the document, clicking on anything (editing and magnifying) freezes the application. Aldus tells me this is a problem with my Quadra 700.

DISCUSSION ----------

The Problem

The problem was with the way Aldus handled their screen buffers. With System 7.0 or 7.0.1, there was no problem. When customers upgraded to System 7.1, then Quadra 950s and Quadra 700s could exhibit the problem.

The Solution

The remedy is to install the latest System Update for System 7.1, currently System Update 3.0.

These articles can help you locate the software update mentioned here:

• "Where To Find Apple Software Updates" - Lists online services for free Apple software updates.

• "Obtaining Apple Product Support in the USA" - Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech Info Library.

Apple HD SC Setup, 3rd-Party Drives, & SCSI Manager 4.3 (1/95)

Revised: 1/13/95
Security: Everyone

Apple HD SC Setup, 3rd-Party Drives, & SCSI Manager 4.3 (1/95)

==========

Article Created: 12 October 1993
Article Reviewed/Updated: 13 January 1995

TOPIC -----

Does Apple HD SC Setup format third party drives to take advantage of SCSI Manager 4.3?

DISCUSSION -----

Apple does not distribute a SCSI formatter that supports both SCSI Manager 4.3 and third party drives. Apple HD SC Setup 7.2.2 that ships with System Update 2.0.1 does not support third party drives, and although Apple HD SC Setup 3.0.1 shipped with A/UX supports third party drives, it doesn't support the SCSI Manager 4.3.

As of October, 1993 there are two third party SCSI drive formatters that support SCSI Manager 4.3. To locate a vendor's address and phone number, use the vendor name as a search string.

- MicroNet Technology's SCSI utility software v6.0 which is compatible with their drives.

- CharisMac Engineering's Anubis, v 2.5 which is a universal formatter.

Other vendors should have "SCSI Manager 4.3-savvy" drivers soon.

Article Change History:
13 Jan 1995 - Made corrections to application name appearing in article.
21 Oct 1994 - Retitled to better describe the article.

Token Ring 4/16 NB Card RAM Expansion (11/93)

Revised: 11/17/93
Security: Everyone

Token Ring 4/16 NB Card RAM Expansion (11/93)

==========

Article Created: 7 October 1993
Article Reviewed/Updated: 17 November 1993

TOPIC ----------

I'm having difficulty obtaining a specified correct part for a DRAM upgrade to the Apple Token Ring 4/16 NB Card. Is the OKI part number M514400A-70Z, an acceptable substitute?

I would like Apple Computer's opinion on the acceptability of OKI part M514400A-70Z.

DISCUSSION ----------

We cannot bless an OKI part number as an acceptable replacement for a Toshiba or TI chip. We do not have access to the parts in question or the specifications of the OKI parts. Based on the part number it sounds like you want to upgrade the card with 2.0 MB of RAM to a total of 2.5 MB of RAM.

The best answer is for you to contact Marshall's Electronics telemarketing department at 800-800-2968 and ask to purchase, via credit card, the proper parts. There is a $50.00 minimum purchase requirement.

These are two parts they have in stock:

1) For 0.5 MB upgrade: Use TI part number TMS44C256-10SD @ $8.20 each (need 4 per card)

2) For 2.0 MB upgrade: Use TI part number TMS44000-12SD @ 27.50 each (need 4 per card). You may also used Toshiba part number TC514400AZ-80.

The Marshall's telemarketing staff is quite helpful on equivalent ZIP chip modules which have the bit density (256K x 4 or 1024K x 4) and the proper speed (120ns minimum). The parts are rare but a large semiconductor distributor has them.

Article Change History:
17 Nov 1993 - Updated to the proper chip speed.

Disk First Aid: Disk Error & Cannot Repair Messages (6/96)

Revised: 6/27/96
Security: Everyone

Disk First Aid: Disk Error & Cannot Repair Messages (6/96)

==========

Article Created: 13 October 1993
Article Reviewed/Updated: 27 June 1996

TOPIC ----------

1) When I checked my hard drive using Disk First Aid v7.2, I got the following messages:

Checking catalog file.
Problem: Missing thread record, 3499, 160
Rechecking catalog file.
Test done. Problems were found, but Disk First Aid cannot repair them.

2) On another note, my Trash also will not empty with only one item in it. This also applies if there are multiple files in only one folder.

DISCUSSION ----------

General Background Information
==========

A directory, consisting of the Catalog B*-tree and the Extents B*-tree, among other things, keeps track of file locations. The Catalog B*-tree contains a unique entry for every file, specifying its name, attributes, location, and other information. It functions as an index or a table of contents for the disk. The Extents B*-tree contains information about file fragments (files may be broken up and stored in different locations on a disk).

The bottom level of a B*-tree structure is occupied exclusively by Leaf Nodes. A Catalog file leaf node can contain four different types of records, one of which is the File Thread Record. A file thread record provides a link between a file and its parent directory. It enables the File Manager to find the name and directory ID of the parent of a given file.

Answer to Question 1

==========

When Disk First Aid reports the thread for a file is missing and it cannot repair it, this means that it is unable to reconcile the entry for the file in the directory (Catalog B*-tree) with the location of the file on the volume. Usually Disk First Aid is unable to repair the missing thread record due to on of the following three situations:

Situation A

Disk First Aid is not being used properly. You cannot repair the boot volume (the startup disk) with Disk First Aid. If you are started from your hard drive, Disk First Aid cannot repair it until you start your Macintosh from another startup disk. Make sure you are starting up from your Power Macintosh CD, the System 7.5 Disk Tools floppy diskette, or other bootable disk (floppy or hard). Disk First Aid also cannot repair a disk on which it is located (basically, it cannot repair itself), or any disk where File Sharing is turned on).

Situation B

The file has been overwritten or characteristics changed (briefly: the file has become damaged).

Situation C

The Catalog B*-tree is damaged.

Apple recommends whenever you encounter directory problems that cannot be fixed by programs such as Disk First Aid, Norton Disk Doctor, and Central Point MacTools' DiskFix, backup your files and reformat the hard drive. Continuing to use a volume that has a damaged directory places your data in jeopardy!

Answer to Question 2
==========

Folders that cannot be thrown away may suggest a directory problem or a Finder flag problem. If it is the latter, programs such as UnlockFolder or Rename Rescue may help. The former, in the context of the problem you are reporting, provides further evidence of directory damage.

This article was published in the Information Alley on 10 May 1996.

Hard Drive: 230MB Drive Thermal Recalibration (10/93)

Revised: 10/13/93
Security: Everyone

Hard Drive: 230MB Drive Thermal Recalibration (10/93)

==========

Article Created: 13 October 1993

TOPIC ----------

Why does my 230MB drive access itself periodically when I'm not doing anything?

DISCUSSION ----------

The head positioning servo in the 230 MB drive maintains the heads over the desired track during the read/write operations. Fine tuning the position of the heads to compensate for changes in the thermal environment of the drive is a "designed in feature" of the 230 MB disk assembly, and is called "thermal recalibration"

When thermal conditions in the drive change, the servo system compensates for thermally induced dimensional changes, and keeps the heads properly positioned. At power on and at other predetermined times, and whenever an internal thermistor senses temperature changes greater than a specified amount, servo position information pre-written on the inner (ID) and outer (OD) tracks of the drive is sampled and used to provide correction to the location of the read/write heads relative to the optical encoder; this ensures that they are properly positioned over the magnetic recording surface during data transfer operations. This capability enhances the drives ability to accurately read and write data over it's specified operating environment.

This information pertains to the Apple 230MB drive as well as the 3rd Party drives using the Quantum ProDrive LPS 230 mechanism.

Alternating Cursor: Macintosh Can't Boot (11/94)

Revised: 11/2/94
Security: Everyone

Alternating Cursor: Macintosh Can't Boot (11/94)

==========

Article Created: 13 October 1993
Article Reviewed/Updated: 02 November 1994

TOPIC ----------

After starting the Macintosh, it draws a menu bar with no text, freezes, and then the cursor changes between the watch and arrow continuously. The Macintosh never completes the startup sequence. The Macintosh can't boot from a System 7.x floppy disk, but can boot from a System 6.x floppy disk. Booting with extensions off or zapping parameter RAM doesn't help either.

DISCUSSION ----------

The cause of this is incorrect window coordinates in the Finder. The Finder stores the top-left and bottom-right coordinate of each window. Should, for some reason, the bottom-right coordinate of a window be to the left or top of the top-left coordinate, the Finder will get very confused. You'll then see the alternating wristwatch and arrow cursor.

The solution to this problem is to restart with the Option key held down. This forces the Finder to close all the windows, and zero out their coordinates. This may not work if a third party keyboard is in use, for best results, use an Apple keyboard to zero out the coordinates.

Article Change History:
02 Nov 1994 - Added possible problems with third party keyboards.
30 Sep 1994 - Edited to include the words "watch" and "pointer".

LaserWriter Driver Differences: Version 8.0 and 8.1.1 (10/93)

Revised: 10/15/93
Security: Everyone

LaserWriter Driver Differences: Version 8.0 and 8.1.1 (10/93)

==========

Article Created: 15 October 1993

TOPIC ----------

What are the differences between LaserWriter driver v8.0 and v8.1.1?

DISCUSSION ----------

Here's a summary of the differences between versions 8.0 and 8.1.1 of the LaserWriter driver:

NEW FEATURES:

Improved Tray Handling

When installed, the user may select the optional 500-sheet paper cassette as the "default" paper source. This was a much-requested feature from users. This feature is found in the "Configure" dialog during printer Setup from the Chooser.

Precision Bitmap Alignment

The driver now scales bitmaps in accordance with the resolution of the output device: 4% reduction as usual for 300 dpi printers, 10% for 400 dpi, and so on.

Consolidated PPDs

Multiple PPD files for different memory configurations are replaced by a single PPD file containing specifications for different page sizes. For example, we used to have 3 PPD files for the LaserWriter IIg v2010.113 (4MB, 5MB and 8MB) - with v8.1.1, we have one.

Improved Color Matching

The driver will use the ColorSync System Profile, if installed on the host,

instead of the Apple 13" colorspace profile built into the driver.

BUG FIXES

There are various bug fixes in LaserWriter 8.1.1 that address both driver and 3rd party application issues. Apple is suggesting that users of LaserWriter driver 8.0 upgrade to LaserWriter driver 8.1.1 mainly because of these bug fixes, and also for the additional features.

SNA•ps 5250 Can't Connect, Config Problem (10/93)

Revised: 10/14/93
Security: Everyone

SNA•ps 5250 Can't Connect, Config Problem (10/93)

==========

Article Created: 13 October 1993

TOPIC -----

I'm having trouble connecting SNA•ps 5250 1.0 to a SNA•ps Gateway 2.0. I have verified the gateway configuration and it is working. I'm starting 32 sessions and all sessions are contention winners. QAUTOVRT is set to 500.

When I start SNA•ps 5250 I get a zone list. I can see the gateway in the gateway list. I can see both pool and session names in the pool/sessions column.

SNA•ps 5250 control panel Local LU is set for PASSTHRU and Auto Configuration. Local LU name on gateway is PASSTHRU.

When I select a session (or pool - I've tried it both ways) and click the Connect button I get the error, "Couldn't connect to session because there is an error communicating with the SNA•ps gateway."

I have tried to get a trace on the SNA•ps gateway and it showed nothing. I also run an SNA trace on the AS/400 and there is no traffic related to starting display station PASSTHRU or connecting a terminal session. No errors are generated on the AS/400.

This leads me to believe that this is a problem with SNA•ps 5250 itself. Gateway and terminal emulator are being run on the same Mac right now, but I've also tried connecting 5250 sessions from other Macintoshs on network, and get the same error message.

The gateway is a Macintosh IIci, 20 MB RAM, System 7.1, AppleTalk 58.0, EtherTalk 2.5, Asante Ethernet card, 32-bit addressing on, file sharing off.

I am certain this is not an SNA communications problem. This has something to do with the connection between the gateway and the emulator.

DISCUSSION ----------

Since the gateway bound all contention winner sessions correctly, we all passed judgement on the correctness of the SNA•ps Gateway configuration too quickly. The TP configuration of the SNA•ps Gateway was incorrect in the Characteristics area on the dialog box. The SNA•ps 5250 emulator requires the Basic/Mapped Verb radio button be selected and the PIP information check box selected. You have the Basic radio button and no check box for PIP information. The SNA•ps 5250 attach Verb call was rejected since it requires Mapped verb support so you get the dialog box " Couldn't connect to session because there is an error communication with the SNA•ps gateway." This is a generalized failure to connect dialog box which is displayed for the less often encountered attach errors.

You ended up with this TP configuration by using the Apple supplied sample configs which come with the 2.0 gateway. You used that config file as a base for other configuration entries and never checked on the Characteristics required in the SNA•ps 5250 documentation. If you had done the config from scratch, the normal TP defaults are Basic/Mapped and PIP checked.

DAL VM Server on VM/ESA and SUM Function Problems (10/93)

Revised: 10/15/93
Security: Everyone

DAL VM Server on VM/ESA and SUM Function Problems (10/93)

==========

Article Created: 7 October 1993

TOPIC ----------

This article describes a reported problem with the DAL VM Server, release 1.3.5 and queries which include the aggregate function, SUM.

DISCUSSION ----------

A few VM/ESA sites have reported problems of intermittent hangs, and server abends, with the DAL VM Server, release 1.3.5 and queries which include the aggregate function, SUM.

The symptom can be seen in a VM console log of the DAL session as an '80A' (Virtual Storage Capacity exceeded) abend, or an 'A0A' (Decimal Overflow Exception) abend of the server.

It has been determined that there needs to be a ZAP applied to the source code to solve this problem.

In both the DALVM and IDALVM modules the instruction at 034D4 needs to be NOP'd:

```
034CE  D700F000F000
034D4  4410C060
```

Needs to be changed to:

```
034CE  D700F000F000
034D4  07000700
```

Always be sure to do a verify before doing the Zap.

An additional factor to remember is that the user's virtual machine needs to be at least 6MB, and 8MB when DAL will be used with TCP/IP connections.

PhotoFlash: Description (10/93)

Revised: 5/7/96
Security: Everyone

PhotoFlash: Description (10/93)

==========

Article Created: 18 October 1993

TOPIC ----------

This article describes the PhotoFlash software.

DISCUSSION ----------

PhotoFlash is a photo-publishing product that focuses on the process of working with photos in documents. It provides tools for:

- Image management (a browser)
- Acquisition (support for many file formats and acquire plug-ins)
- Adjustment (basic image prep and tone control), and
- Placement into documents (automatic scripts).

As it is a companion to document creation, PhotoFlash is also very compact and fast, occupying around 3MB of RAM and providing responsive editing and adjustment tools. This allows a modest computer (8 to 12MB RAM) to run page layout software and PhotoFlash at the same time to speed the process of photo-publishing.

PhotoFlash is delivered on 2 floppy disks, along with a disk full of sample images. The PhotoFlash package also includes AppleScript 1.0 and QuickTime 1.6.1, which are part of the one-button installation process. PhotoFlash is fully scriptable and recordable and can be linked with many AppleScript applications for enhanced productivity.

Features

- High-performance
  Very quick response and processing speed
  Acceleration via SuperMac Thunder/DayStar Charger cards
- Memory-efficient
  Virtual memory minimizes memory requirements
  Accelerated JPEG provides for smaller files

- Fast Photo CD
  Industry's fastest reading of Photo CDs
- Image compression
  Accelerated JPEG saves time, space, transmission time
- Easy Picture Access
  Integrated browser for visual image location
- Simple User Interface
  Simple human interface and terminology
  Direct placement into Quark, PageMaker documents
- Automatic Tools
  Automatic brightness and contrast adjustment
  Automatic scratch and dust removal; Quick sharpen, blur, resize, crop
- Picture Previews
  Real-time previews of different effects
- Scripting
  Full AppleScript support; record and playback any actions
  10 useful scripts included along with more advanced scripting tools
  Automates repeated work across applications
- Tight Integration
  Direct linkage between PhotoFlash and XPress or PageMaker
  allows direct placement into Quark and PageMaker documents.
- Compatibility
  Supports PICT, TIFF, JPEG, Photoshop, Photo CD, EPS, DCS files
  Other file support can be added via plug-ins.
- Expandability
  Accepts third-party Photoshop compatible plug-ins and filters
  Direct access to peripherals through plug-in support
- Scriptable
  Fully scriptable/configurable to work with other applications
  Can be customized for specific tasks
- File conversion
  File formats can be converted in single or batch modes.

Newton Messaging Card: How to Setup (10/93)

==========

Article Created: 18 October 1993
Article Reviewd/Updated: 15 November 1993

TOPIC ----------

How do I setup my Newton Messaging Card?

DISCUSSION ----------

With the Newton Messaging Card and the Apple Wireless Messaging Service, you can receive, read and store messages on your Newton. Anyone who knows your personal identification number (PIN) can send you number messages (such as a telephone number) or text messages that you can read on your Newton. If you've signed up for voice messaging, the Messaging Card can let you know when you've received a voice message.

Setup

To use your Messaging Card, you must activate the Apple Wireless Messaging Service, install the battery and turn on the card.

To activate the Apple Wireless Messaging Service, call the toll-free number listed in the information brochure that came with your Messaging Card. Be sure to have your Messaging Card available if you need to read the Card's ID number to the operator. You'll also be able to choose among the service options available in your area.

When you activate the service, you will receive a seven-digit PIN which is your address on the messaging service. Others must know your PIN to send you a message.

You will also receive a four digit PassCode which is a security code. You'll need it to review, hold or release messages, change your personal greeting, listen to voice messages or use other voice message features. Be sure to change your PassCode when you receive it and keep it to yourself.

To install the battery, follow these steps:

1) Slide off the battery compartment cover.
2) Insert one AAA-size battery. Be sure to properly orient the positive (+) and negative (-) terminals.
3) Replace the battery compartment cover.

Replace the battery when the indicator light flashes red or if a low-battery alert appears while you're reading messages.

To turn on the Messaging Card, slide the power switch to the left. The messaging card must be on to receive a message, but it does not have to be inserted into your Newton.

If someone sends you a message while the card is off, you will not receive the message. If you've left the card off for a while or believe that you've missed some messages, you can review those messages by calling a toll-free number listed in the messaging server quick reference guide.

To insert your Messaging Card, flip the latch on the top left corner of the Newton and press down on the switch to eject the current card. Then, insert the Messaging Card into the slot. It will not go all the way into the slot. When you insert the card, a dialog box with the message "Newton Messaging Card" will be displayed on the screen.

NOTE: On some airlines, passengers are asked to turn off their pagers to prevent possible interference with navigation systems. If you're on such a flight, turn off the Messaging Card.

TOPIC ----------

How do I use the Apple Wireless Messaging Service?

DISCUSSION ----------

The Apple Wireless Messaging Service, with the Newton Messaging Card, allows you to:

- Send and receive text and number messages
- Send and receive voice messages by telephone
- Hold, release or review your messages

Messages are distributed by wireless communication and can be received in major metropolitan areas and cities in the United States and Canada. You can select different coverage options depending upon your needs.

You can subscribe to the Apple Messaging Service by calling 1-800-474-6374. You should have your Newton Messaging Card available when you call.

When you subscribe to the Apple Wireless Messaging Service, you will receive a seven-digit personal identification number (PIN) which is your address on the messaging service. Others must know your PIN to send you a message.

You will also receive a four digit PassCode which is a security code. You'll need it to review, hold or release messages, change your personal greeting, listen to voice messages or use other voice message features. Be sure to change your PassCode when you receive it and keep it to yourself.

Sending Messages

To send a text message, follow these steps:

1) Call 1-800-577-9757.
2) Enter the recipient's PIN. Do not press the pound key (#).
3) An operator will take your message, then repeat the message to verify it. You can send a message of up to 55 characters.
4) You can now send another message. When you have finished sending messages, hang up.

To send a number message, follow these steps:

1) Call 1-800-639-9757.
2) Enter the recipient's PIN. Do not press the pound key (#).
3) Enter a number message, either a phone number or numeric code. The message will be repeated back to you.
4) To send another message to another PIN, enter the second PIN. When you have finished sending messages, hang up.

To send a voice message, follow these steps:

1) Call 1-800-639-9757.
2) Enter the recipient's PIN. Do not press the pound key (#).
3) Leave a voice message of up to 60 seconds.
4) To send another voice message to another PIN, enter the second PIN. When you have finished sending messages, hang up.

Receiving Messages

To receive messages with your Newton Messaging Card, you must switch on the card and be within range of the messaging service transmitters. Your messaging service quick reference guide will give you information about your local coverage area.

To view text and number messages on your Newton, follow these steps:

1) Insert the Messaging Card into your Newton.
2) Tap the Extras button to open the Extras Drawer.
   - To view unread messages only, tap In Box, then tap Receive. Tap Pager in the list of choices that appear. After a few seconds, any new messages will appear in the list.
   - To view all messages, Tap Pager, then tap the dot at the bottom of the screen to list all of your messages. Tap the message that you want to view.

When you are sent a voice message, your Newton Messaging Card receives an alert. To receive your voice messages (by telephone), follow these steps:

1) Call 1-800-639-9757.
2) Enter your PIN, then press the star key (#) to interrupt the greeting.
3) Enter your PassCode. Any voice messages you haven't heard are played back in the order they were received.
   - Press the 3 key to delete a message.

- Press the 5 key to save a message.

Reviewing Messages

If someone sends you a message while the Messaging Card is off, you won't receive the message, but the message will be stored with the messaging service for 72 hours. You can review these messages by telephone.

You can also have a message re-sent to your Messaging Card.

To review these messages by telephone, follow these steps:

1) Call 1-800-639-9757 and enter your Personal Identification Number (PIN).
2) Press the star key (*) to interrupt the greeting, then enter your PassCode.
3) Press the pound key (#) for options, then press the 3 key for Message Management.
4) Press the 1 key to review your messages. You will hear the most recent message first.
   - Press the 3 key to delete a message
   - Press the 5 key to hear a message again
   - Press the 6 key to skip a message
   - Press the 8 key to start again from the beginning
5) To have a message re-sent to your messaging card, press the 7 key.
6) Press the 9 key to exit to Options, then press the star key (*) to exit Options and hang up.

Holding Messages

You can also have the messaging service hold your number and text messages for up to two weeks until you are ready to receive them. You can then release these messages at any time before the holding period ends.

To hold your messages, follow these steps:

1) Call 1-800-639-9757 and enter your Personal Identification Number (PIN).
2) Press the star key (*) to interrupt the greeting, then enter your Passcode.
3) Press the pound key (#) for options, then press the 3 key for Message Management
4) Press the 2 key again for Page Hold.
5) Enter the number of hours you want your messages held (from 1 to 99 hours; enter 99 if you want messages held for 14 days).
6) Press the star key (*) to exit, and hang up.

To release your messages, follow these steps:

1) Call 1-800-639-9757 and enter your Personal Identification Number (PIN).
2) Press the star key (*) to interrupt the greeting, then enter your Passcode.
3) Press the pound key (#) for options, then press the 3 key for Message Management
4) Press the 3 key again for Page Release.

5) Press the 7 key (for "Release") to release your messages.
6) Press the star key (*) to exit, and hang up.

Performa 550: Specifications (11/95)

Revised: 11/1/95
Security: Everyone

Performa 550: Specifications (11/95)

==========

Article Created: 18 October 1993
Article Reviewed/Updated: 1 November 1995

TOPIC ----------

This article gives technical specifications for the Macintosh Performa 550 computer.

DISCUSSION ----------

Microprocessor

- MC68030, 33 MHz clock speed; 32-bit data bus
- Built-in memory-management unit
- Socket for optional MC68882 floating-point unit (FPU)

Memory

- 5MB RAM standard (4MB on logic board, 1MB in SIMM)
- Expandable (by authorized Apple dealer) to as much as 36MB by adding 1MB, 2MB, 4MB, 8MB, 16MB, or 32MB SIMM to a single 72-pin slot. Requirement: 72-pin fast-paged, 80ns or faster.
- 1MB ROM

Disk Drives

- One built-in Apple SuperDrive 1.4MB floppy disk drive
- One internal 160MB hard disk
- Internal AppleCD 300i double-speed CD-ROM drive

Video Display

- Integrated Macintosh Color Display with 14-inch Trinitron CRT
- Resolution: 640 x 480 pixels, 69 dpi
- 768K (512K on main board and 256K SIMM) VRAM supports 32,768 colors (16-bit color)

Software

- System Software version 7.1P5
- Educational and productivity software installed on hard drive

Interfaces

- Internal expansion slot for one Macintosh LC processor-direct expansion card. Compatible with Apple IIe Card.
- SCSI interface for connecting up to five external peripheral devices
- Two serial (RS-232/RS-422) ports
- One stereo sound-output port for external audio amplifier or headphones
- Two Apple Desktop Bus (ADB) ports for keyboard, mouse, and other devices
- Front headphone jack
- Built-in electret microphone above display
- One sound-input port for four sources: internal or external* microphone, internal CD-ROM, or external audio

*NOTE:
The Apple PlainTalk Microphone, which is sold as a standalone product, is compatible with these systems. These products cannot use the older style low-level output microphone used on previous Macintosh models.

Sound Generator

- Stereo 8-bit digital-analog conversion using 22-kHz sample rate - capable of driving stereo headphones or other stereo equipment through the sound jack and headphone jack
- Built-in stereo speakers

Keyboard and Mouse

- ADB Mouse II
- Apple Keyboard II

Clock/Calendar

- Custom integrated circuit with long-life lithium battery

Disability Access

- CloseView, Easy Access, and visible-beep software are built in.
- Third-party options provide alternative input and output devices

Power Requirements

- Line voltage: 90 to 264 V AC, RMS single phase, automatically configured
- Frequency: 47 to 63 Hz
- Power: 40 W maximum, not including display
  60 W maximum, including display

- Energy-saving feature reduces power consumption by 50%
- One AC outlet powers computer, display, drives, and speakers

ADB Power Requirements

- Maximum current draw for all ADB devices: 500 mA (three ADB devices maximum is recommended)
- Mouse draws 10 mA
- Keyboard draws 25 to 80 mA, depending model used

Size and Weight

Main unit:
- Height: 17.9 in. (45.5 cm)
- Width: 13.5 in. (34.4 cm)
- Depth: 16.5 in. (42.0 cm)
- Weight: 40.5 lbs (18.4 kg)

Mouse:
- Height: 1.3 in. (3.3 cm)
- Width: 2.4 in. (6.2 cm)
- Depth: 4.2 in. (10.7 cm)
- Weight: 4.0 oz. (0.10 kg)

Keyboard:
- Weight: 2.2 lb. (1 kg)
- Height: 1.8 inches (44 mm)
- Width: 16.5 inches (418 mm)
- Depth: 5.6 inches (142 mm)

Operating Environment

- Operating temperature: 50 to 104° F (10 to 40° C)
- Storage temperature: –40 to 116.6° F (–40 to 47° C)
- Relative humidity: 20% to 85% noncondensing
- Maximum altitude: 15,000 ft. (4,722 m)

Article Change History:
01 Nov 1995 - Corrected VRAM size.
15 Aug 1995 - Included information about PlainTalk microphone.

DAL TSO Connection/Logoff Problem (10/93)

Revised: 10/18/93
Security: Everyone

DAL TSO Connection/Logoff Problem (10/93)

==========

Article Created: 15 October 1993

TOPIC ----------

I'm having a problem logging out of a DAL TSO session when connected with SNA•ps 3270 network connection. Logout works only when a certain time has elapsed where the IBM mainframe drops the session by itself.

DISCUSSION ----------

This is a problem of the network connection completely before the logoff from TSO has completed. You are experiencing the mainframe system's automatic timeout feature, when it will actually log you out of TSO after a certain pre-determined number of minutes of inactivity.

When we originally discovered this problem (that the DAL and SNA•ps 3270 network adapter does not log a user completely out of TSO after the DAL Server session is terminated by the DAL CLient), the only workaround seemed to be to log on to TSO and reconnect, which would then actually complete the "logoff".

However, now we have a better solution. The problem seems to be that the DAL Client is getting out of the SNA•ps network connection a bit too quickly.

Fortunately, the solution is simple. At the end of the logout sequence of the DAL connection script, add a match for something unique on the VTAM Splash Screen. This will cause the network connection to remain open until the exit from TSO has been completed all the way through to the VTAM Splash Screen.

This results in a clean logoff from TSO which will allow subsequent DAL TSO connections without failures, such as the "user is already connected" TSO error message.

A sample logout sequence would look like:

```
   :\mREADY\w1\slogoff\r\mLogon:
```

rather than:

```
   :\mREADY\w1\slogoff\r:
```

MS Word: Embedding PostScript Code (10/93)

Revised: 10/18/93
Security: Everyone

MS Word: Embedding PostScript Code (10/93)

==========

Article Created: 18 October 1993

TOPIC ----------

I'm doing a mail merge in MS Word. I would like to print the first page of the merge on letterhead and the second page on regular paper. The "First from" and "Remaining from" selections in my LaserWriter 8 driver don't seem to be recognized by Word, so what I've been trying to do is embed PostScript commands in the header for the first and second page of the document. These commands would tell the printer to use a specified paper tray for each page. In the LaserWriter Pro Developer's notes I found the 'setpapertray' command, and, judging by the description for that operator, it looks to be what I need.

How would I embed that operator into the Word document?

DISCUSSION ----------

Unfortunately, what you're trying to do is NOT possible. You were on the right track by trying to embed PostScript into the MS Word document, HOWEVER, the driver controls paper trays and thus overrides any tray selection when a print job is sent.

Basically, the print driver is treating the mail merge document as one single print job and is sending down PostScript code to manage the trays according to what is selected in the Print Dialog for that "one" job.

Apple engineering said that it would be very difficult to create PostScript code to work around this. Our only suggestion would be to see if other applications also handle mail merges as one large print job, or as individual ones.

LaserWriter NTR: Recommended Parallel Cable Length (10/93)

Revised: 10/18/93
Security: Everyone

LaserWriter NTR: Recommended Parallel Cable Length (10/93)

==========

Article Created: 18 October 1993

TOPIC -----

Using a parallel connection, to any PC, what would be the maximum length of cable allowed?

DISCUSSION -----

The maximum recommended length for a parallel cable is 20 feet. Mixed results will occur for distances greater than this depending on the type of cable (shielded vs. ribbon) used and the quality of the connectors. There are other solutions available.

In the United States there is a company called Black Box that sells a product called PC Parallel Hypercable which allows parallel cables to be extended up to a maximum length of 150 feet. Each cable incorporates an integrated amplifier circuit that boosts signal strength and filters noise. The circuit is powered off of the 5 volt signal that is available on pins 13, 14, 15, or 16 of standard parallel interfaces.

For more information look in the Technical Information Library, using "Black Box" as your search string. Similar information may be available from European companies.

Personal LaserWriter NT: Downloading Fonts(10/93)

Revised: 10/18/93
Security: Everyone

Personal LaserWriter NT: Downloading Fonts(10/93)

==========

Article Created: 18 October 1993

TOPIC----------

Can TrueType fonts be downloaded to the Personal LaserWriter NT, specifically Delphian and Lucida Bright?

Also, is there a way to download the TrueType rasterizer?

DISCUSSION ----------

Yes, Delphian and Lucida Bright TrueType fonts can be downloaded successfully to a Personal LaserWriter NT. We (Apple) used LaserWriter driver 8.0 and LaserWriter Utility 7.4.1. The font download seemed to take longer than usual, but was completed. We printed some documents including Delphian and Lucida Bright and as expected, the print job seemed to take less time since the fonts were already resident in RAM.

Something to consider is the limited amount of RAM on a 2MB Personal LaserWriter NT. There is approximately 430K bytes available for fonts and program memory after a fresh restart. Depending on the size of the fonts to be downloaded, there may theoretically be a point where printer performance will degrade with less RAM available. We did not try to print any complex documents (many fonts/graphics) after downloading the TrueType fonts, so we are not sure if lessening the amount of available RAM had an effect.

It is not possible to download the TrueType rasterizer. The rasterizer is downloaded automatically with the print job when TrueType fonts are used and the printer is a Class B (TrueType Scalar is not present in the printer, though can be downloaded) device.

Macintosh Color Display: Design Changes (10/93)

Revised: 10/21/93
Security: Everyone

Macintosh Color Display: Design Changes (10/93)

==========

Article Created: 18 October 1993
Article Reviewed/Updated: 21 October 1993

TOPIC ----------

Were there changes made to the Macintosh Color Display (14-inch)?

DISCUSSION----------

Yes, there have been changes made to the design of the original Macintosh Color Display.

The differences between the Macintosh Color Display, M1198LL /A and /B monitors are that the /B monitor contains additional circuitry so that the monitor is Energy Star compliant, which is a voluntary international agreement that was signed in June 1993. This agreement focuses on making electronic equipment more energy efficient.

Despite the circuitry difference, the monitor specifications and performance is identical to the /A version. They use the exact same ciruitry that produces the video signal and they use the same CRT.

These design changes are not unusual. It is Apple's policy to not only manufacture monitors with the latest technology, but to also make design improvements throughout the life of the product.

Article Change History:
21 October 1993 - added M1198LL /A and /B notations

AudioVision Display: Changing S-video Output Default 10/93

Revised: 10/20/93
Security: Everyone

AudioVision Display: Changing S-video Output Default 10/93

==========

Article Created: 20 October 1993

TOPIC ----------

I connected the S-video output of a Macintosh 840AV to a Sharp projector unit. The menu bar was cut off at the top. I tried every adjustment on the Sharp, and could not get the menu bar back. I switched over to Composite out, and to the Sharp's composite in, and everything worked fine.

The Sharp unit checked out just fine with S-video coming from an S-video tape deck and nothing was missing at the top.

DISCUSSION ----------

When the S-Video output is selected from the 840AV computer, the screen default setting is 640 x 480. This causes the display to overscan and that is why the menu bar is off the screen.

To remedy this situation, go into the control panel and double click on the monitor icon. Select the "option" button and a new window will appear. Select the 512 x 380 resolution and reboot the computer. The computer will now drive the display in the underscan mode and the entire screen will be visible.

LC 475, 476, 520, Performa 550, Quadra 605 Ext. Mic (8/95)

Revised: 8/30/95
Security: Everyone

LC 475, 476, 520, Performa 550, Quadra 605 Ext. Mic (8/95)

==========

Article Created: 19 October 1993
Article Reviewed/Updated: 30 August 1995

TOPIC ----------

No microphone is bundled with the Macintosh LC 475, Performa 475 and 476, and Quadra 605 computers. This article describes the microphone, sold separately, that you need in order to record sounds using the built-in microphone port.

DISCUSSION ----------

The Macintosh LC 475, Performa 475 and 476, and Quadra 605 computers require the new PlainTalk microphone. Microphones bundled with earlier Macintosh models do not work with these computers.

The Macintosh LC 520 and Performa 550 computers use the PlainTalk microphone. Both of these computers have built-in microphones, but also have external microphone jacks. To use the external microphone jack, you need a PlainTalk microphone.

The PlainTalk microphone and the older microphone share a 3.5mm phono plug, but the PlainTalk microphone has a longer plug (.75 inch vs. .5 inch). Consequently, the old microphone does not seat fully in the microphone socket of the PlainTalk microphone.

Ordering Information

M9060Z/A Apple PlainTalk Microphone

Article Change History:
30 Aug 1995 - Changed diameter of microphone plug.
17 Jan 1994 - Added LC 520 and Performa 550 info.

LaserWriter Pro 810: Changing the Default Settings (11/93)

Revised: 11/15/93
Security: Everyone

LaserWriter Pro 810: Changing the Default Settings (11/93)

==========

Article Created: 1 October 1993
Articel Reviewed/Updated: 15 November 1993

TOPIC ----------

The printer has a set of default settings that are applied at the factory. You can change these default settings by using the control panel menu. For example, if you want to change the default paper tray, you'd have to take the printer offline and press the menu key to select the paper source menu. See detailed information below.

DISCUSSION ----------

Use the keys on the control panel to display menu options and to change printer settings.

Keys on control panel:

ONLINE	FORM FEED	MENU	UP ARROW
RESET	PRINT STATUS	ENTER	DOWN ARROW

The printer's control panel settings are grouped into several menus.

- The Input Port menu allows you to select the way your printer communicates with the host.
- The Paper Source menu is used to select how your printer will use it's paper cassettes, manual feed tray and optional multimedia power feeder.
- The PostScript Resolution menu lets you set your printer's resolution to 300, 400, 600, or 800 dots per inch.
- The Miscellaneous menu contains a variety of printer settings.

FOLLOW THE STEPS BELOW TO CHANGE THE PRINTER SETTINGS:

1. If the printer is on line, take it off line by pressing the ONLINE key.

2. Press the MENU key to display the printer's main menu.

3. Press one of the arrow keys until you see the menu you want, then press ENTER. (The first option for that menu appears in the display window.)

4. Press one of the arrow keys to select the option you want to change.

5. Press ENTER.

6. Press the arrow keys to select the new value, then press ENTER.

7. If you want to change another setting, press ENTER until the main menu appears again, then repeat steps 3-6.

8. When you have finished selecting options, press ENTER until the menu appears then press the ONLINE button.

Revised: 10/19/93
Security: Everyone

LaserWriter Pro 810: Using the Printer's Control Panel (10/93)

==========

Article Created: 1 October 1993

TOPIC ----------

This article describes the operator control panel key switches and their functions.

The printer's control panel lets you take the printer off line (to change settings) or on line (to print) and access menus for changing the printer's connection port, paper source, or resolution.

DISCUSSION ----------

Use the keys on the control panel to display menu options and to change printer settings. An asterisk (*) appears in the display window next to any menu item currently selected.

KEY	FUNCTION
ONLINE	Places the printer online or offline. Note, the printer must be offline for the other switches to be functional.
FORM FEED	Ejects the current page from the printer.
MENU	Displays the printer setup menu.
Up and Down arrows	Scrolls up or down through the setup menu.
RESET	Returns the selected menu item to the default value.
PRINT STATUS	Produces a report that supplements the information on the startup page; includes the total copy count, amount of memory on the printer, and the downloaded fonts.

ENTER Selects a menu item to display or select an option.

LW Pro 810: Control Panel Menu & Options Description (8/94)

==========

Article Created: 1 October 1993
Article Reviewed/Updated: 23 August 1994

TOPIC ----------

The printer's control panel settings are grouped into several menus. This article describes the menus & options in more detail.

DISCUSSION ----------

- The Input Port menu: allows you to select the way your printer communicates with the host.
- The Paper Source menu: this menu is used to select how your printer will use its paper cassettes, manual feed tray, and optional multimedia power feeder.
- The PostScript Resolution menu: this lets you set your printer's resolution to 300, 400, 600, or 800 dpi.
- The Miscellaneous menu: contains a variety of printer settings.

The following table shows the menus, the options on each menu, and the values you can select. Default values are marked with an asterisk (*).

MENU	Sub-menu	Option	Values
Input Port	RS-232	RS-232 Enable	Yes, No
		RS-232 Printer Type	PostScript* LJETIIP
		Baud Rate	300, 600, 1200 2400, 4800,

			9600*, 19200, 38400
		Parity	None*, Even, Odd, Mark, Space
		Flow Control	XON-XOFF*, DTR
		Stop Bits	1* or 2
		Data Bits	8* or 7
	LocalTalk	LocalTalk Enable	Yes, No
		Printer Type	PostScript or LJETIIP
Paper Source			Tray 1, Tray 2, Tray 3 Manual Feed, Auto Cascade MM Power Feeder
Miscellaneous		Restore Factory Setup	
		Exit Jam Reprint	Enable*, Disable
		Startup Page	Enable*, Disable
		SCSI Delay	Off*, 20, 40, 60
PostScript Resolution			300, 400, 600, 800 (dots per inch)

NOTE: When the Auto Cascade option is selected, the printer uses any of the selected paper trays when the first one runs out of paper. Auto Cascade works only if all paper trays in the set you select contain the same size paper. If one of the selected paper trays contains a different size paper, the LaserWriter Pro skips it.

NOTE: If HPLJIIP is selected as the printer type, the printer always prints at 300 dpi and this menu selection has no effect.

NOTE: Some settings can be selected using either the printer control panel or the printer software - for example the LaserWriter Utility program. The printer uses the most recent setting. For example, if you select 800 dpi resolution in the LaserWriter Pro utility software and then you select 600 dpi resolution on the control panel, the printer prints at 600 dpi.

LaserWriter Pro 810: Control Panel Status Messages (10/93)

Revised: 10/19/93
Security: Everyone

LaserWriter Pro 810: Control Panel Status Messages (10/93)

==========

Article Created: 1 October 1993

TOPIC ----------

This article describes the operator control panel status messages.

DISCUSSION ----------

MESSAGE	MEANING
INTERNAL SELF TEST	Places the printer online or offline. Note, the printer must be offline for the other switches to be functional.
READY TO PRINT	Eject the current page from the printer.
PROCESSING	Displays the printer setup menu.
WAITING FOR DATA	Printer is waiting for data from the host system.
OFFLINE	Printer is offline.
MANUAL FEED	The manual feed option is selected and printer is waiting for paper to be inserted.
INSTALL TRAY	The selected cassette is out of paper or not installed.
REMOVE PAPER FROM MANUAL TRAY	Another paper source has been selected and paper was left in the manual feed.
PAPER JAM: PAPER ENTRY	Paper is jammed in the cassette area.

PAPER JAM: PAPER EXIT	Paper is jammed in the fuser or paper exit area.
PAPER JAM: OPEN TOP COVER	Paper is jammed inside the top of the printer.
TONER LOW	Toner in the EP Cartridge is low.
REPLACE EP KIT	Toner in the EP Cartridge is expelled, replace the EP Cartridge, Transfer Charger, and Roller Cleaner.
EP CARTRIDGE NOT IN POSITION	The EP Cartridge is not installed correctly.

LaserWriter Pro 810: Fonts Shipping with the 810 (10/93)

Revised: 10/19/93
Security: Everyone

LaserWriter Pro 810: Fonts Shipping with the 810 (10/93)

==========

Article Created: 1 October 1993

TOPIC ----------

What fonts are included with the LaserWriter Pro 810?

DISCUSSION ----------

The LaserWriter Pro 810 printer will ship with 35 PostScript Type 1 fonts in ROM and a disk version of the Apple Font Library with 64 TrueType fonts.

The Type 1 fonts will benefit the mixed-Macintosh environment customers when working in Windows and DOS. In the PCL mode 33 of the 35 Type 1 fonts are utilized and rasterized as the expected font. Only ZapfDingbats and Symbol fonts cannot be utilized in PCL.

35 ROM fonts

Avant Garde (4 typefaces)
Bookman (4 typefaces)
Chicago
Courier (4 typefaces)
Helvetica (4 typefaces)
Helvetica Narrow (4 typefaces)
New Century Schoolbook (4 typefaces)
Palatino (4typefaces)
Symbol
Times (4 typefaces)
Zapf Chancery
Zapf Dingbats

64 Disk Fonts

Avant Garde (4 typefaces)

Bookman (4 typefaces)
Chicago
Courier (4 typefaces)
Delphian
Garamond Narrow (4 type faces)
Geneva
Helvetica (4 typefaces)
Helvetica Black (2 typefaces)
Helvetica Compressed (2 typefaces)
Helvetica Narrow (4 typefaces)
Lubalin Graph (4 type faces)
Lucida Bright (4 type faces)
Machine
Monaco
Nadianne (2 typefaces)
New Century Schoolbook (4 typefaces)
New York
Old English Text
Onyx
Oxford
Palatino (4 typefaces)
Swing
Symbol
Times (4 typefaces)
Zapf Chancery
Zapf Dingbats
Zeal

LaserWriter Pro 810: Memory Upgrades (11/93)

Revised: 11/9/93
Security: Everyone

LaserWriter Pro 810: Memory Upgrades (11/93)

==========

Article Created: 1 October 1993
Article Reviewed/Updated: 9 November 1993

TOPIC ----------

Printer memory is upgradable with 4 MB or 8 MB modules, up to 32 MB total printer memory (see chart below). Upgrade kits should be installed by your authorized Apple dealer.

DISCUSSION ----------

The LaserWriter Pro 810 printer comes standard with 8 MB RAM and 3 MB ROM. The 8 MB RAM allows for rasterizing and printing resolutions up to 800 dpi in letter and A4, and 600 dpi rasterizing and printing in paper sizes up to legal. Memory upgrades are available for printing high resolutions on to large paper sizes, for example, to rasterize pages for printing at 600 dpi on ledger or A3 requires 12 MB RAM and to effectively rasterize and print at 800 dpi on ledger or A3 sized pages requires 16 MB RAM. To achieve the maximum memory capacity requires three 8 MB RAM upgrades.

RAM upgrades provide the following benefits

- faster performance on complex documents (the RAM provides more space to store the calculations needed for large or complex images)
- faster performance when downloading fonts
- faster performance when printing documents that have been scaled down from larger originals (complex organization charts, maps, flow charts)
- the ability to increase the imageable area of a document (you can use more of a sheet of ledger paper, for example)
- the ability to print at higher resolutions

Memory Upgrade Consideration

- The LaserWriter Pro 810 requires a memory upgrade to print at 600 or 800 dpi on certain sizes of paper.

The LaserWriter Pro 810 uses custom memory modules developed specifically for this printer. Each memory module interfaces to the controller board via two connectors which are 40 and 50 pins each. The controller board has room for three memory modules allowing for a total of 32 megabytes of on board DRAM. The following chart describes the supported configurations:

The following memory configurations are supported by the LaserWriter Pro 810:

Total Memory	On-Board Memory	Bank 1 Memory	Bank 2 Memory	Bank 3 Memory
8 MB	8 MB	n/a	n/a	n/a
12 MB	8 MB	4 MB	n/a	n/a
16 MB	8 MB	4 MB	4 MB	n/a
	8 MB	8 MB	n/a	n/a
20 MB	8 MB	4 MB	4 MB	4 MB
	8 MB	8 MB	4 MB	n/a
24 MB	8 MB	8 MB	4 MB	4 MB
	8 MB	8 MB	8 MB	n/a
28 MB	8 MB	8 MB	8 MB	4 MB
32 MB	8 MB	8 MB	8 MB	8 MB

NOTE:

- Always fill the lowest numbered banks first. It doesn't matter what order the 4 MB or 8 MB memory modules go in as long as the lower banks are filled first.

- Do not use RAM from another laser printer with a LaserWriter Pro 810.

- Once you have upgraded your printer's memory, you need to reconfigure the printer driver to take advantage of the additional memory. Open the the Chooser's Setup box. Click More Choices in the Setup box. Click Configure, Choose the options installed on your printer and click OK.

Ordering Information

- LaserWriter Pro 4MB Memory Upgrade (Part No. M1442G/A)
- LaserWriter Pro 8MB Memory Upgrade (Part No. M1443G/A)

Article Change History:

9 November 1993 - corrected memory upgrade information
28 October 1993 - Updated memory upgrade chart

Revised: 7/18/94
Security: Everyone

LaserWriter Pro 810: Pinouts (7/94)

==========

Article Created: 1 October 1993
Article Reviewed/Updated: 18 July 1994

TOPIC ----------

This article gives the printer port pinouts for the following connectors: Mini DIN-8 Serial, DB9 Serial, and the SCSI interface.

DISCUSSION ----------

Mini DIN-8 Serial Connector Signal Descriptions

Pin	Signal	Description
1	CLK	Rxd and Txd clock (output)
2	NC	No Connection
3	TxD	Transmitted Data (output)
4	SG	Signal Ground
5	RxD	Received Data (input)
6	TxD+	Balanced transmit (output)
7	Vcc	+5 VDC regulated, 300 mA max (output power)
8	RxD+	Balanced receive (input)
Shield	PG	Protective Ground

9 Pin RS-232 Serial Connector Signal Descriptions

Pin	Signal	Description
1	DCD	Data Carrier Detect
2	RXD	Received data
3	TXD	Transmitted Data
4	DTR	Data Terminal Ready
5	GND	Frame Ground
6	DSR	Data Set Ready
7	RTS	Request To Send

8	CTS	Clear To Send
9	RING	Ring Indicator–Not Used

SCSI Interface Signal Descriptions

Pin	Signal	Description
1	REQ	Request data transfer
2	MSG	Message signal from target device
3	I/O	Controls direction of valid data
4	RST	SCSI bus RESET condition
5	ACK	Acknowledgment for data transfer handshake
6	BSY	Indicates the SCSI bus is in use
7.9,14,16,18,24	GND	Logic Ground
8	DB0	Data bit 0
10	DB3	Data bit 3
11	DB5	Data bit 5
12	DB6	Data bit 6
13	DB7	Data bit 7
15	C/D	Indicates Control or Data is on the SCSI bus
17	ATN	An Attention condition exist
19	SEL	Select a target or reselects the initiator
20	PARITY	A data bit generated to maintain an odd number of bits
21	DB1	Data bit 1
22	DB2	Data bit 2
23	DB4	Data bit 4
25	NC	No Connection

LaserWriter Pro 810: Questions and Answers (11/95)

Revised: 11/21/95
Security: Everyone

LaserWriter Pro 810: Questions and Answers (11/95)

==========

Article Created: 1 October 1993
Article Revised/Updated: 23 March 1995

TOPIC ----------

This article addresses questions on the LaserWriter Pro 810.

DISCUSSION ----------

Question: Who is the target customer for the LaserWriter Pro 810?

Answer: The LaserWriter Pro 810 is tailored to the networked professionals who work continually in mixed environments of Unix, DOS, Windows and Macintosh, and need fast, crisp text printing.

Question: How much faster is the LaserWriter Pro 810 than the LaserWriter Pro 600 and 630?

Answer: The answer to that depends on the complexity of the print job, and the size of the file from which you print. On average, a LaserWriter Pro 810 will image 20% faster than a LaserWriter 600 or 630, and prints at speeds up to 20 pages per minute.

Question: What are the differences between the LaserWriter Pro 600 Series and the LaserWriter Pro 810?

Answer: LaserWriter Pro 600 Series is intended for desktop use by workgroups in graphics intensive Ethertalk environments. LaserWriter Pro 810 is intended for tabletop use in departments with massive printing requirements, and for those requiring seamless integration into many operating systems and network environments.

Question: Can a LaserWriter Pro 600 or 630 be upgraded to a LaserWriter 810?

Answer: No. These printers are based on a completely different design, with different capabilities and benefits to customers.

Question: What network operating systems are supported?

Answer: Mac OS, Apple A/UX, Novell, HPUX, Sun Solaris, SCO Unix, DEC Ultrix, IBM AIX, Interactive Unix, Windows, and DEC VMS are currently supported.

Question: What networking protocols are supported?

Answer: Over Twisted Pair and Thin Wire Ethernet, Ethertalk, TCP/IP, Netware IPX, and DEC LAT are supported. All of our protocols are enabled at once, simultaneously active and accessible over the network.

Question: Why is it important to have multiple, simultaneously active protocols implemented in a network printer?

Answer: The printer needs to have the same protocols as the users' systems or they won't be able to communicate directly and efficiently. If the protocol isn't supported by the printer, additional network software and capabilities are required, adding cost and processing overhead to the network. Clearly, all the needed protocols must be available all the time, or the benefit of offering them at all diminishes greatly.

Question: How fast is a LaserWriter Pro 810 over the network?

Answer: The I/O bandwidth is not a factor in the printers' speed, that is the interface won't slow down the printing. Depending on what the resource allocation of the network by the system administrator is to the printer, LaserWriter Pro 810's have demonstrated capability to accept data at 350K bytes a second.

Question: What print quality capabilities are available?

Answer: Users can software select 300, 400, 600 or 800 dpi print resolutions.

Question: Is TrueType installed in the printer?

Answer: No, the printer has only Type 1 PostScript fonts installed. However, the LaserWriter Pro 810 ships with 64 TrueType fonts on disk.

Question: Does it support PhotoGrade or FinePrint?

Answer: No, this printer uses other proprietary third-party resolution enhancement techniques to improve the image resolution beyond the 400 DPI

capabilities of the print engine.

Question: What fonts are in the printer?

Answer: 35 ROM fonts: Avant Garde (4 typefaces), Palatino (4typefaces), Bookman (4 typefaces), Symbol, Courier (4 typefaces), Times (4 typefaces) Helvetica (4 typefaces), Zapf Chancery, Helvetica Narrow (4 typefaces), Zapf Dingbats, New Century Schoolbook (4 typefaces), and Chicago.

64 Disk Fonts: Avant Garde (4 typefaces) Geneva, Bookman (4 typefaces), Helvetica Black (2 typefaces), Courier (4 typefaces), New York, Helvetica (4 typefaces), Lubalin Graph (4 type faces), Helvetica Narrow (4 typefaces), Lucida Bright (4 type faces), New Century Schoolbook (4 typefaces), Machine, Palatino (4 typefaces), Monaco, Symbol, Nadianne (2 typefaces), Times (4 typefaces), Helvetica Compressed (2 typefaces), Zapf Chancery, Old English Text, Zapf Dingbats, Onyx, Chicago, Oxford, Delphian, Swing, Garamond Narrow (4 type faces), and Zeal.

Question: Does the LaserWriter Pro 810 support automatic emulation switching?

Answer: Yes. The LaserWriter Pro 810 utilizes a brilliant exciting new technology called Virtual Printer, which, among other things, provides a fool-proof means of recognizing PCL from PostScript, by determining the network's IP address of the queue or the PC sending the print command, and printing jobs accordingly as a DOS printer or a PostScript printer.

Question: Does the LaserWriter Pro 810 support PCL Level 5?

Answer: No, it supports PCL with Level 4+.

Question: What processor does this printer use?

Answer: The processor is a RISC based Weitek 8200 chip.

Question: What kind of RAM does it use?

Answer: The printer uses 4MB and 8MB RAM Modules, not to be mistaken for SIMM modules.

Question: What RAM configurations are possible?

Answer: All printers are equipped with 8MB standard, and can be upgraded with 4MB or 8MB RAM up to a maximum of 32 MB RAM achieved by 4x8MB RAM.

Question: How much ROM and RAM are standard?

Answer: 3 MB ROM and 8MB RAM.

Question: Is software for Windows users included?

Answer: Yes. There are drivers included to support Windows 3.0 and Windows 3.1.

Question: What network management tools does the LaserWriter 810 offer?

Answer: The LaserWriter Pro 810 offers SNMP, the only viable non-proprietary network management facility used. The printer also has a Remote Console Facility, useful for tasks performed by the network manager.

Question: What is SNMP?

Answer: The acronym stands for Simple Network Management Protocol. By being SNMP capable the LaserWriter Pro 810 will be a recognized agent to a network management program like HP Open View, DEC MccDirector and PolyCenter, console programs of Sun, and others.

Question: What is the Remote Console Facility and what does it do?

Answer: The network manager can log in to the facility and obtain status information, can configure and manage the network printer for the enterprise much like this administrator would expect to manage other devices on the network. The manager can log in from IPX, LAT, LAT, or Ethertalk.

Question: What engine is the LaserWriter Pro 810 based on?

Answer: The engine is a Fuji Xerox XP 20.

Question: Is this a duplex printer?

Answer: No duplexing capabilities or options are available at this time.

LaserWriter Pro 810: Specifications (4/94)

==========

Article Created: 1 October 1993
Article Reviewed/Updated: 11 April 1994

Topic ----------

This article gives the technical specifications for the Laserwriter Pro 810.

Discussion ----------

Print engine

- Fuji Xerox XP 20 laser xerographic

Print quality

- 400 dot-per-inch native engine resolution with controller technology allowing 600 and 800 dot-per-inch resolutions
- 300-dot-per-inch available in PCL mode
- 64 scalable fonts for printing a wide range of styles and sizes

Speed

- 20 page-per-minute maximum print speed. Actual speed depends on the image complexity

Controller

- Weitek 7.25 MHz 8200 RISC processor

Printer Memory

- 8 MB of RAM standard, expandable to 32 via 4 MB and 8 MB expansion kits
- 8MB required for 800-dpi letter size
- 12MB required for 800-dpi legal size
- 16MB required for 800-dpi tabloid size

Fonts

• 64 TrueType fonts on disks from the following font families:
  Avant Garde, Bookman, Chicago, Courier, Geneva, Helvetica,
  Helvetica Narrow, Monaco, New Century Schoolbook, New York,
  Palatino, Symbol, Times, Zapf Chancery, and Zapf Dingbats
• 35 PostScript Type 1 fonts in ROM
• 33 scalable fonts for PCL mode

Imageable Area

• Minimum top and bottom margin: .2 inches (5 mm)
• Minimum left and right margin: .2 inches (5 mm)

Interfaces

• LocalTalk: standard
• RS 232 serial: standard
• Ethernet: thin wire or twisted pair
• External SCSI port

Dimensions

• Height: 19.2 inches (48.7 cm)
• Width: 20.4 inches (51.9 cm)
• Depth: 16.1 inches (41 cm)

Weight

• 81 pounds (37 kg)

Recommended duty cycle

• 600,000 pages minimum
• Toner cartridge: 11,000 pages at 5% density

Operating environment

• Temperature: 50° to 93°F (10° to 35°C)
• Humidity: 15% to 85%, noncondensing

Storage environment
---
engine:
• Temperature: -4° to 131°F (-20° to 55°C)
• Humidity: 15% to 85%, noncondensing

EP cartridge
• Temperature: 32° to 95° F (0° to 35°C)
• Humidity: 35% to 85%, noncondensing

Power requirements

• U.S./Japan: 100 -115 VAC (± 10%), 50-60 Hz (± 2 Hz)
• Europe/Australia: 220-240 V (± 10%), 50 Hz (± 2 Hz)

Power consumption

• 850 W maximum at 115 or 220 VAC

Paper handling capacity

• Three Universal cassettes standard
  - Capacity: 250 sheets
  - Type: Plain, transparency, label
  - Weight: 16 - 28 pound
  - Supports: Letter (8.5"x 11"), Legal (8.5"x 14"), Ledger (11"x17"), A3 (297mm x 420mm), A4 (210mm x 297mm), B4 (257mm x 364mm), B5 (257mm x 182mm)

• Manual Feed
  - Tray Capacity: 1 sheet
  - Type: Plain, transparency, label, envelope
  - Weight: Paper, 16 - 50.7 pound
  - Envelope: 28 pound maximum
  - Supports: Letter (8.5"x 11"), Legal (8.5"x 14"), Executive (7.25"x 10.5"), Invoice (5.5" x 8.5"), A4 (210mm x 297mm), A5 (210mm x 148mm), Monarch (3.875" x 7.5"), Comm 10 (4.125"x 9.5"), Folio (210mm x 330mm), B4 (257mm x 364mm), B5 (257mm x 182mm)

• Automated Media Feeder (optional)
  - Capacity: 100 sheets, 15 envelopes
  - Type: plain, transparency, label, envelope, post card
  - Weight: paper, 16 - 36 pound
  - Envelope: 28 pound maximum

• Optional cassettes: Executive and folio

Envelope sizes supported

• Monarch (3.875" x 7.5")
• Comm 10 (4.125"x 9.5")
• International DL (110mm x 220mm)
• International C5 (162mm x 229mm)

Media output

• Standard face down output tray – 250 sheet capacity
• Optional face up output tray – 50 sheet capacity

Network management

• Supports SNMP, allowing the printer to be recognized as a network element and managed by system administrators

- Features Remote Console Facility (RCF), allowing network managers in TCP/IP, NetWare, and LAT environments to recognize, diagnose, and manage the printer

Internal Adobe PostScript fax cartridge option

- Send and receive capabilities
- Adobe PostScript fax compatible
- Group 3 fax compatible
- Prints up to 800 dpi PostScript faxes on plain paper

LaserWriter Pro 810: Description (10/93)

Revised: 10/19/93
Security: Everyone

LaserWriter Pro 810: Description (10/93)

==========

Article Created: 1 October 1993

TOPIC ----------

This article describes the LaserWriter Pro 810 printer.

DISCUSSION ----------

The LaserWriter Pro 810 is based on the Fuji Xerox 20 page per minute xerographic engine. Designed for enterprise-wide connectivity, it delivers high quality output, expanded paper handling, and flexibility in mixed environments. The LaserWriter Pro 810 uses 400-dot-per-inch engine technology combined with controller technology that supports up to 800-dot-per-inch print resolution, providing the highest quality available from a LaserWriter.

It can print on a wide variety of paper sizes with three, 250-sheet universal cassettes standard. Optional cassettes and an automated feeder are available for additional sizes and paper thicknesses.

This printer provides advanced connectivity required in high end laser printers. With its built-in Ethernet, LocalTalk, and Serial ports it can print documents generated by many different types of computers, including those running Macintosh, MS-DOS, Windows, or UNIX operating systems. The built-in network card allows the printer to communicate with many network operating systems concurrently via multiple protocols, including TCP/IP, EtherTalk, NetWare IPX, and Digital LAT, further increasing your connectivity options.

FEATURES

Print quality

- 400-dot-per-inch resolution default
- Up to 800-dot-per-inch resolution for high-quality text and graphics

Power and Speed

- Weitek 8200 RISC processor
- 20-page-per-minute maximum print speed

Connectivity

- RS-232 serial, LocalTalk, and Ethernet ports for compatibility in mixed environments
- Built-in network card for transparent, simultaneous printing over Ethernet from multiple operating systems using four concurrent protocols: IPX, TCP/IP, Ethertalk, and Digital LAT
- Virtual Printer Technology provides switching between PostScript Level 2 and PCL emulations
- Twisted-pair (10BaseT) or thin-wire Ethernet (10Base2) transceiver configurations available to meet your requirements
- A SCSI interface that can be used to attach an external hard drive for additional font storage
- Necessary software drivers and utilities to support DOS and Windows are included

Fonts

- 64 TrueType fonts on disks from the following font families: Avant Garde, Bookman, Chicago, Courier, Geneva, Helvetica, Helvetica Narrow, Monaco, New Century Schoolbook, New York, Palatino, Symbol, Times, Zapf Chancery, and Zapf Dingbats
- 35 PostScript Type 1 fonts in ROM
- 33 scalable fonts for PCL mode

Memory

- Standard 8 MB of RAM and 3 MB of ROM
- Printer memory is upgradable with 4 MB or 8 MB modules, up to 32 MB total printer memory

Paper Handling

- Three 250-sheet universal cassettes support multiple paper sizes, including tabloid, A3, A4, A5, B4, B5, letter and legal
- Single sheet manual feed tray
- Optional cassettes support executive and folio paper sizes
- Allows printing on envelopes, labels, transparencies, and letterhead or plain paper

Versatility

- Uses Virtual Printer technology, the controller automatically switches to the appropriate emulation, in accordance with the network source address of the incoming data stream
- NetWare IPX, AppleTalk, TCP/IP, and Digital LAT protocol support over Ethernet
- Supports PostScript Level 2 and PCL 4+, offers seamless transfer between

page description languages
- 400-dot-per-inch native engine resolution with controller technology allowing 600 and 800-dot-per-inch resolutions
- Optional Internal PostScript fax cartridge is available to take advantage of printer's fax send/recieve capability and allow up to 800-dot-per-inch crisp, plain paper printing of PostScript faxes as well as standard faxes

LW Pro 810: Internal PostScript Fax Modem Option (8/94)

Revised: 8/23/94
Security: Everyone

LW Pro 810: Internal PostScript Fax Modem Option (8/94)

==========

Article Created: 28 September 1993
Article Reviewed/Updated: 23 August 1994

TOPIC ----------

This article describes the (optional) internal fax modem for the LaserWriter Pro 810.

DISCUSSION ----------

The LaserWriter Pro 810 Internal PostScript Fax Modem gives you the ability to send and receive facsimiles (faxes) with fax machines and other printers equipped with PostScript fax cards. When the fax modem is installed (user installable), your printer is called a LaserWriter Pro 810f.

The LaserWriter Pro 810f:

- Sends documents to and from other Adobe PostScript printers, and to all CCITT (International Telephone and Telegraph Consultative Committee) Group III fax devices from an Apple Macintosh or IBM PC or compatible computer

- Sends and receives faxes 9600 baud

- Receives and prints fax transmissions at 600 dots per inch (dpi) from other printers equipped with PostScript fax cards

- Receives and prints fax transmissions at 200 dpi - the Group III standard - from Group III - compatible fax machines

- Sends PostScript language files to other printers equipped with PostScript fax cards at the resolution of the receiving printer

- Broadcasts a fax to multiple destinations with one command

- Delays fax transmission up to 24 hours

- Enables all users on a network connected to the printer to send and receive faxes

System requirements

- An Apple Macintosh computer running system software version 6.0.7 or later
  or
  an IBM PC or compatible computer with at least 640 K or memory running DOS 3.1
  or
  an IBM PC or compatible computer with at least 1 MB of memory (2 MB recommended) running Microsoft Windows 3.0

- A LaserWriter Pro 810 printer

- A phone receptacle that accepts an ordinary RJ-11 or CA-11 telephone cable

NOTE: The fax modem will not work if you connect it to a digital phone line, which is intended to carry computer data exclusively, and it may not work if connected to a digital private exchange (PBX) system.

Ordering Information

- Internal Adobe PostScript Fax Modem (Part Number M1772LL/A)

Quadra 610: Description (5/96) (Discontinued)

==========

Article Created: 21 October 1993
Article Reviewed/Updated: 28 May 1996

TOPIC ----------

This article describes the Macintosh Quadra 610 computer.

DISCUSSION ----------

Overview

Based on the fast 25-mHz Motorola 68040 processor, the Macintosh Quadra 610 provides affordable high performance. It comes with 8MB of RAM and an integral math coprocessor (no FPU in the USA's 8/160 configuration). You can expand memory to up to 68MB for sophisticated graphics and multimedia applications as well as mainstream business programs.

The Quadra 610 provides high-speed Ethernet support on-board.

For convenience, the Quadra 610 supports all Apple displays and almost any commonly available third-party display, including monochrome or color, portrait or landscape, RGB or VGA, and any screen size. You can display up to 256 colors on all Apple color monitors and, with additional video RAM, more than 32,000 colors on most Apple monitors. Which means you get more colors than ever from your display without having to purchase an additional video card.

The Quadra 610 is easy to expand. It comes with eight built-in ports and an expansion slot, so you can set up a system that meets your exact needs, as well as increase your computing power as your needs grow.

The Quadra 610 includes an internal hard drive. Its high-speed SCSI interface lets you add high-volume storage devices, such as the AppleCD 300i internal CD-ROM drive, so you can run hundreds of CD-ROM titles.

Features

- 25-MHz 68040 processor with integral math coprocessor
- 8MB of RAM, expandable to 68MB
- 512K of VRAM, expandable to 1MB
- Works with all Apple monitors as well as many third-party NTSC, PAL, VGA, and SuperVGA displays

Expansion

- With 512K VRAM upgrade, supports 16-bit color, allowing for display of thousands of colors
- Eight built-in ports to support a wide range of peripherals
- Slot for processor-direct or NuBus expansion card (requires adapter)
- Optional internal CD-ROM drive
- On-board Ethernet (AAUI)

Compatibility & Networking

- Runs thousands of Macintosh applications
- Reads Macintosh, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats
- Built-in AppleTalk networking
- File sharing without a dedicated server
- On-board Ethernet (AAUI)

Ordering Information

Order No. M2319LL/A

Quadra 650: Description (10/93) (Discontinued)

==========

Article Created: 21 October 1993

TOPIC ----------

This article describes the Macintosh Quadra 650 computer.

DISCUSSION ----------

Overview

Based on the fast 33-megahertz Motorola 68040 processor, the Quadra 650 provides affordable high performance. It comes with 8MB RAM and an integral math coprocessor. For increased performance, you can expand memory to up to 136MB.

For performance and convenience, the Macintosh Quadra 650 works with all Apple displays. The standard Macintosh Quadra 650 can display 256 crisp colors on the Macintosh 16-inch Color Display. When you want to work with photographic-quality images, a simple video upgrade lets you show 32,768 colors.

You can use the Quadra 650's expandability to set up a system that meets your exact needs, as well as to increase your computing power as your needs grow. Customize your system by adding NuBus expansion cards in the three expansion slots provided. It even provides high-speed Ethernet support on-board.

The Quadra 650 comes standard with an internal hard drive. Its high-speed SCSI interface lets you add high-volume storage devices, such as the AppleCD 300i internal CD-ROM drive, so you can run hundreds of CD-ROM titles.

Features

- 33-MHz 68040 processor with integral math coprocessor
- 8MB RAM, expandable to 136MB
- 512K VRAM, expandable to 1MB
- Works with all Apple and many third-party displays
- With 512K VRAM upgrade, supports 16-bit color, allowing for display of

thousands of colors

Expansion

- Eight built-in ports to support a wide range of peripherals
- Three NuBus slots for expansion cards
- Optional internal CD-ROM drive
- One inline 68040 processor-direct slot
- On-board Ethernet (AAUI)

Compatibility & Networking

- Runs thousands of Macintosh applications
- Reads Macintosh, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats
- Built-in AppleTalk networking
- File sharing without a dedicated server

Quadra 610: Specifications 3/94 (Discontinued)

==========

Article Created: 21 October 1993
Article Reviewed/Updated: 18 March 1994

TOPIC ----------

This article provides technical specifications for the Macintosh Quadra 610 computer.

DISCUSSION ----------

Microprocessor

- MC68040, 25-MHz clock speed, 32-bit data bus
- Integral FPU (floating-point unit), except in the USA's 8/160 configuration
- Integral PMMU (Paged Memory Management Unit) and 8K-cache architecture

Memory

- Comes with 8MB of RAM on the logic board
- Expandable to 68MB of RAM by adding Single Inline Memory Modules (SIMMs) to two 72-pin slots. (Doesn't support 1MB, 2MB, or 64MB 72-pin SIMMs.) RAM must be 80 ns or faster.
- Includes RAM disk software
- 1MB ROM

Disk Drives

- One built-in Apple SuperDrive 1.4MB floppy disk drive
- One internal 160MB or 230MB
- Accommodates one 5.25-inch half-height device, such as the AppleCD 300i internal CD-ROM drive

Video Display

- Supports all Apple displays
- Works with a wide range of third-party displays, including some 19-in.,

VGA, SVGA, NTSC, and PAL monitors

Video RAM (VRAM)

VRAM must be 80 ns or faster.
512K Standard Supports:
- 32,768 colors on the Macintosh 12-inch RGB Display
- 256 colors on the AppleColor High-Resolution RGB Display (13"), Macintosh Color Display (14"), and Macintosh 16-inch Color Display
- 256 shades of gray on the Macintosh 12-inch Monochrome Display
- 16 shades of gray on the Macintosh Portrait Display (15")
- 16 colors on the Macintosh 21-inch Color Display

1MB Option Supports:
- 32,768 colors on the Macintosh 12-inch RGB Display, AppleColor High-Resolution RGB Display (13"), Macintosh Color Display (14"), and Macintosh 16-inch Color Display
- 256 shades of gray on the Macintosh 12-inch Monochrome Display and Macintosh Portrait Display (15")
- 256 colors on the Macintosh 21-inch Color Display

System Software

Macintosh System software version 7.1 with System Enabler 040 ver. 1.1

Interfaces

- Internal expansion slot for one processor-direct or 7-inch NuBus expansion card (requires adaptor)
- SCSI interface for connecting up to six external peripheral devices
- AAUI-15 Ethernet connector (optional)
- Two serial (RS-232/RS-422) ports
- One video port for color and monochrome displays of various sizes and resolutions
- One sound-output port (stereo) for external amplifier or headphones, and CD playthrough
- One sound-input port for monaural sound input
- Two Apple Desktop Bus (ADB) ports for a keyboard, mouse, and other devices

Sound Generator

- Custom integrated circuit that drives a stereo miniature headphone jack (22 kHz sample rate)

Keyboard and Mouse

- Several ADB keyboards with numeric keypads available
- Apple Desktop Bus Mouse II

Clock/Calendar

• Custom integrated circuit with long-life lithium battery

Disability Access

CloseView, Easy Access, and visible-beep software are built in. These and third-party options provide alternative input and output devices

Power Requirements

• Line voltage: 100 to 240 V AC, RMS single phase, automatically configured
• Frequency: 47 to 63 Hz
• Power: 210 W maximum, not including display power

ADB power Requirements

• Maximum current draw for all ADB devices: 500 mA
  (three ADB devices maximum recommended)
• Mouse draws 10 mA
• Keyboard draws 25 to 80 mA (depending on the model used)

Size and Weight

Main Unit:
• Height: 3.4 in. (8.5 cm)
• Width: 16.3 in. (41.5 cm)
• Depth: 15.6 in. (39.7 cm)
• Weight: 14.0 lbs (6.4 kg) Weight varies depending internal devices installed.

Mouse:
• Height: 1.3 in. (3.3 cm)
• Width: 2.4 in. (6.2 cm)
• Depth: 4.2 in. (10.7 cm)
• Weight: 4.0 oz. (0.10 kg)

Operating Environment

• Operating temperature: 50 to 104° F (10 to 40° C)
• Storage temperature: –40 to 116.6° F (–40 to 47 °C)
• Relative humidity: 5% to 95% noncondensing
• Maximum altitude: 10,000 ft. (3,048 m)

Article Change History:
26 October 1993 - added reference to lack of FPU in 8/160 configuration.

TOPIC ----------

This article provides technical specifications for the Macintosh Quadra 650 computer.

DISCUSSION ----------

Microprocessor

- MC68040, running at 33 MHz
- Integrated 33-MHz math coprocessor (FPU)
- Integral Paged Memory Management Unit (PMMU), and 8K-cache architecture

Memory

- Comes with 8MB of RAM on the logic board
- Expandable to 136MB of RAM by adding SIMMs to four 72-pin slots. (Doesn't support 1MB, 2MB, or 64MB 72-pin SIMMs.)
- Includes RAM disk software
- 1MB ROM
- DRAM must be 80 ns or faster.

Disk Drives

- One built-in Apple SuperDrive 1.4MB floppy disk drive
- One internal 230MB or 500MB hard disk drive
- Accommodates one 5.25-in., half-height device, such as the AppleCD 300i internal CD-ROM drive

Video Display

- Supports all Apple displays

- Works with a wide range of third-party displays including some 19-in., VGA, SVGA, NTSC, and PAL monitors

Video RAM (VRAM)

VRAM must be 80 ns or faster.
512K standard supports:

- 32,768 colors on the Macintosh 12-inch RGB Display
- 256 colors on the AppleColor High-Resolution RGB Display (13"), Macintosh Color Display (14"), and Macintosh 16-inch Color Display
- 256 shades of gray on the Macintosh 12-inch Monochrome Display
- 16 shades of gray on the Macintosh Portrait Display (15")
- 16 colors on the Macintosh 21-inch Color Display

1MB option supports:

- 32,768 colors on the Macintosh 12-inch RGB Display, AppleColor High-Resolution RGB Display (13"), Macintosh Color Display (14"), and Macintosh 16-inch Color Display
- 256 shades of gray on the Macintosh 12-inch Monochrome Display and Macintosh Portrait Display (15")
- 256 colors on the Macintosh 21-inch Color Display

System Software

Macintosh System software 7.1 with System Enabler 040 ver. 1.1

Interfaces

- Three internal NuBus expansion slots
- One 68040 processor-direct slot
- SCSI interface for connecting up to six external devices
- AAUI-15 Ethernet connector (Ethernet itself is built in)
- Two serial (RS-232/RS-422) ports
- One video port for color and monochrome displays of various sizes and resolutions
- One sound-output port for stereo playback from CDs and stereo playback of Macintosh sound
- One monaural sound-input port
- Two Apple Desktop Bus (ADB) ports for a keyboard, mouse, and other devices

Sound generator

- Custom integrated circuit that drives a stereo miniature headphone jack (22 kHz sample rate)

Keyboard and mouse

- Works with several ADB keyboards
- Apple Desktop Bus Mouse II

Clock/Calendar

• Custom integrated circuit with long-life lithium battery

Disability Access

• CloseView, Easy Access, and visible-beep soft-ware are built in. These and third-party options provide alternative input and output devices.

Power Requirements

• Line voltage: 100 to 240 V AC, RMS, automatically configured
• Frequency: 50 to 60 Hz
• Power: 112 W maximum, not including display power

ADB power requirements

• Maximum current draw for all ADB devices: 500 mA (three ADB devices maximum recommended)
• Mouse draws 10 mA
• Keyboard draws 25 to 80 mA, depending on the model used

Size and weight

Main unit:
• Height: 6.0 in. (15.2 cm)
• Width: 13.0 in. (33.0 cm)
• Depth: 16.5 in. (41.9 cm)
• Weight: 25 lb. (11.3 kg) Varies depending on internal devices installed.

Mouse:
• Height: 1.3 in. (3.3 cm)
• Width: 2.4 in. (6.2 cm)
• Depth: 4.2 in. (10.7 cm)
• Weight: 4.0 oz. (0.10 kg)

Operating environment

• Operating temperature: 50 to 104° F (10 to 40° C)
• Storage temperature: –40 to 116.6° F (–40 to 47° C)
• Relative humidity: 5% to 95% noncondensing
• Maximum altitude: 10,000 ft. (3,048 m)

Article Change History:
18 March 1994 - Added "Macintosh" to title.
2 November 1993 - Corrected speed of FPU (33 MHz, not 25 MHz).
24 December 1993 - Corrected power requirement (112 W, not 325 W).

LW Pro 810: Media Kits For Hosts (11/93)

Revised: 11/29/93
Security: Everyone

LW Pro 810: Media Kits For Hosts (11/93)

==========

Article Created: 21 October 1993
Article Reviewed/Updated: 29 November 1993

TOPIC ----------

This article describes the media kits for non-Macintosh host on the LaserWriter Pro 810.

DISCUSSION ----------

Customers purchasing a LaserWriter Pro 810 will require Media Kits for each type of non-Macintosh host system. The software to be installed will supplement application drivers already on the host system for direct printing to the LaserWriter Pro 810 over the network. These kits contain the binary images, the actual software to be downloaded to the network. Included in the kit is a guide and the actual media. The media itself varies according to the host requirements shown below.

The table below shows the media kits:

System Type	Ships with LW Pro 810	Optional Media Kit
Macintosh	All necessary software	NA
UNIX host	Unix TAR format on 3.5" diskettes	QIC kit
DEC host	DOS format of VMS install on 3.5" diskettes	TK50 kit

Article Change History:
29 November 1993: Added Optional Media Kit information

LW Pro 810: Remote Console Facility (10/93)

Revised: 10/19/93
Security: Everyone

LW Pro 810: Remote Console Facility (10/93)

==========

Article Created: 21 October 1993

TOPIC ----------

This article describes the Remote Console Facility or the Apple LaserWriter Pro 810.

DISCUSSION ----------

The Remote Console Facility (RCF) is a tool used by network managers and system administrators to support mixed environments, principally DEC's LAT, UNIX's TCP/IP, and Novell's IPX environments. In these environments the network manager can log-in to the print server via the Remote Console Facility to retrieve and modify printer information. When logged-on the network manager can retrieve status, configure, and manage the network printer for the enterprise much like an administrator in those environments would expect to manage other devices on the network. The network manager can log in over IPX, LAT, TCP/IP.

Remote Console Facility is not required in a pure Macintosh environment because necessary Network management functions can be achieved from the Macintosh using the LaserWriter Utility, Vanguard, and Print Monitor utilities. The LaserWriter Utility will be used for printer name changes, Vanguard to support all bin selection and printer resolution options, and Print Monitor to get the status of a LaserWriter on the network.

LW Pro 810: Virtual Printer Tech Key Points (7/94)

Revised: 7/18/94
Security: Everyone

LW Pro 810: Virtual Printer Tech Key Points (7/94)

==========

Article Created: 21 October 1993
Article Reviewed/Updated: 18 July 1994

TOPIC ----------

This article describes the key points about Virtual Printer Technology (VPT) on the LaserWriter Pro 810.

DISCUSSION ----------

The key points about Virtual Printer Technology (VPT) are increased reliability and flexibility, multiple protocol management, printer resource accounting and management, and implementation by supplemental device drivers and no host software modification.

Personal printer flexibility

The printer will automatically configure itself to the configuration requirements of individual users or work groups sharing the printer. It will also save and restore any down loaded fonts, forms, macros, etc. for individual users or work groups.

Multiple concurrent protocols

VPT will concurrently support multiple network protocols allowing seamless communications with major network operating systems in a heterogeneous enterprise network environment.

Host software

VPT does not require replacement of any network operating system software. This means no custom code is required for Novell or VMS operating systems. You are not locked into proprietary software from your printer vendor.

Device driver assistance

VPT provides a means of supplementing device drivers by automatically enabling selected printer capabilities without modifying the device driver. This is particularly important to operating systems with applications specific device drivers such as MS-DOS, UNIX and VMS.

Increased reliability

VPT can reduce the likelihood of printer hangs by having the imaging controller automatically determine if it has reached an abnormal state and instructing the network interface to discard the current print job and go on to the next.

Resource accounting

Many installations require printer resource accounting for charge back purposes or to measure printer utilization. VPT can count the total of bytes, page images, and physical pages for each virtual printer.

Remote Console Facility (RCF)

VPT equipped printers can be managed and configured over the network. Network Administrators can check the status of and configure individual virtual printers and all network configuration parameters for the printer. Printer resource accounting information is also available through the RCF.

Simple Network Management Protocol (SNMP) compliance

VPT is SNMP compliant, initially with Management Information Block(MIB) II, Character MIB, and RS-232 MIB. Future plans call for proprietary MIBs for full printer management through SNMP management stations.

Security: Everyone

LaserWriter Pro 810: Windows, DOS Software Drivers (3/95)

==========

Article Created: 21 October 1993
Article Reviewed/Updated: 3 March 1995

TOPIC ----------

This article describes the software drivers for Windows or DOS.

DISCUSSION ----------

Windows Software Drivers

Windows 3.0 and 3.1 drivers have been developed to support the LaserWriter Pro 810 printer. These LaserWriter Pro 810 specific drivers include a great deal of the functionality found in Macintosh utilities, and will allow the user to access all standard and optional paper trays as well as select the desired print quality.

DOS Software Drivers

In DOS, individual applications ship with their own drivers, providing optimal support for the actual software application. However, some select customized applications' drivers have been developed for LaserWriter Pro 810 printers, maximizing the benefits of the printers for users of these applications: AutoCAD, Word 5.0 (DOS), Word Perfect 5.1 (DOS), and PC Send (used to download to the serial port).

Locating Printer Drivers

The LaserWriter Pro 810 printer drivers can be found on the "LaserWriter Pro, Software for DOS" disk that came with the printer.

Article Change History:
03 Mar 1995 - Added where to to locate printer drivers.
18 Jul 1994 - Removed reference to a parallel port.

LaserWriter Select 360: Specifications (7/95)

Revised: 7/25/95
Security: Everyone

LaserWriter Select 360: Specifications (7/95)

==========

Article Created: 1 October 1993
Article Reviewed/Updated: 25 July 1995

Topic ----------

This article provides the technical specifications for the LaserWriter Select 360.

Discussion ----------

Marking Engine

Fuji Xerox laser-xerographic

Print Quality

- PostScript: 300 or 600 dots per inch, selectable
- LaserJet III Emulation: 300 or 600 dots per inch

Printer Memory
---
7 MB of RAM Standard, upgradable to 16 MB

Printer Fonts
---
64 Fonts Are Provided, Including Such Fonts As ITC Avant Garde, ITC Bookman, Chicago, Courier, Delphian, Garamond Condensed, Geneva, Helvetica, Helvetica Black, Helvetica Narrow, Lubalin Graph, Lucinda Bright, Machine, Monaco, Nadianne, New Century Schoolbook, New York, Old English Text, Onyx, Oxford, Palatino, Swing, Symbol, Times, ITC Zapf Chancery, ITC Zapf Dingbats, And Zeal.

Laser

- Type: semiconductor laser
- Wavelength: 780 nanometers
- Output Power: 5 milliwatts maximum

Speed

Ten pages per minute maximum. Actual speed depends on the images printed and the computer used.

Interfaces

- One LocalTalk port
- One Parallel (36-pin Centronics) port
- One RS-232 serial port

Recommended Duty Cycle

Minimum life expectancy is 300,000 pages, with no monthly page limit.

Paper Feed

Automatic feed from paper cassettes and multipurpose tray; manual feed for single sheets

Energy Star

The LaserWriter Select 360 is EPA Energy Star-compliant

Printing Materials

Apple recommends 20-lb.photocopy or typewriter bond. You can use 16-lb. to 28-lb. paper in the cassette trays, and 16-lb. to 36-lb. paper via manual feed. The printer accepts most letterhead and colored stock, and medium-weight photocopier transparencies. Print labels or transparencies using manual feed or the multipurpose tray. Use envelopes recommended for Laser printers. Print envelopes using manual feed or automatically if you have the optional envelope cassette installed. Paper made with talc is not recommended for use with this printer.

Paper Capacity

- Standard Cassette: Holds up to 250 sheets of U.S. Letter, A4, or B5 paper Sizes.

- Optional Cassettes are available for 250 sheets of U.S. legal paper and 500 sheets of U.S. Letter or A4 paper.

- Multipurpose Tray: Holds up to 50 sheets of U.S.legal, A4, U.S. letter B5, or executive paper, or 5 envelopes.

- Envelope Cassette: Holds up to 30 Com-10, Monarch, Dl, or C5 envelopes.

Imageable Area

- Maximum printable line: 8.1 inches (207.7 mm)
- Minimum top, left and right margins: .194 inches (4.9 mm)

- Minimum bottom margin: .167 inches (4.2 mm)

Actual imageable area may vary depending on the application program. The printer senses cassette size and adjusts to maintain these margins.

Paper Sizes

Width: Minimum - 97mm (3.82 in) Maximum - 216mm (8.5 in)
Length: Minimum - 148mm (5.83 in) Maximum - 356mm (14.0 in)

Dimensions

Height: 8.0 inches (25.8 Cm)
Width: 15 inches (38 Cm)
Depth: 18.3 inches (45.8 Cm)

Weight
---
29 pounds (13.2 Kg)

Acoustic noise levels (bystander position)

Standby: 36dBA
Printing: 47 dBA

Operating Environment
==========

Humidity
---
20 To 80 percent, noncondensing

Toner cartridge transit environment

-4 to 104 deg. F (-20 to +40 deg. C)

Input Electrical Requirements

U.S./Japan: 100-115 V (+/- 10%), 50-60 Hz (+/-2 Hz)
Europe/Australia: 220-240 V (+/-10%), 50 Hz (+/-2 Hz)

Power Consumption

Operating: 450 W maximum at 115 V or 220 V

Ozone Emission

0.05 parts per million maximum, measured in accordance with ECMA 129 of UL114 standards for ozone measurement

System Requirements

Macintosh:
System software 7 or later
- Minimum 2 MB of memory (4 MB recommended)

System software 6.0.7 or 6.0.8
- Minimum 2 MB of memory

MS-DOS/Windows:
Windows 3.0 or later
- Minimum 2 MB of memory (4 MB recommended)

Ordering Information

LaserWriter 360 & accessory kit: M2049LL/A

LaserWriter 360 Bundle (printer, accessory kit & toner cartridge): B1333LL/B

LaserWriter Select Toner cartridge: M1960G/A

LaserWriter 360 PostScript Fax Card: M2345LL/A

LaserWriter Select 250-Sheet Feeder/Cassette: M2041G/A
. (supports A4, U.S. letter, A5, and executive paper sizes)

LaserWriter Select 500-Sheet Feeder/Cassette: M2042G/A
. (supports A4 and U.S. letter paper sizes)

LaserWriter Select 250-Sheet Letter Cassette: M2034G/A

LaserWriter Select Envelope Cassette (holds 30 envelopes): M2031G/A

LaserWriter Select Legal Cassette (holds 250 sheets): M2032G/A

Article Change History:
25 Jul 1995 - Revised maximum paper weights
20 Mar 1995 - Added paper sizes
13 Mar 1995 - Added System software requirements.

LaserWriter Select 360: Adding PostScript Fax (12/93)

Revised: 12/3/93
Security: Everyone

LaserWriter Select 360: Adding PostScript Fax (12/93)

==========

Article Created: 5 October 1993
Article Reviewed/Updated: 3 December 1993

TOPIC ----------

Can you tell me more information about the fax capability on my LaserWriter 360?

DISCUSSION ----------

The optional PostScript Fax card offered with the LaserWriter Select 360 can send and receive faxes with traditional fax machines, computers with fax cards, and other PostScript Fax capable printers. A networked LaserWriter Select 360 printer is available to anyone on the network and therefore is a multi-user fax solution.

When communicating with other fax machines, PostScript Fax printers will produce 200 dpi and deliver the best results possible, given the limitations of a fax machine. However, when communicating with another PostScript Fax capable printer, the LaserWriter Select 360 can deliver and receive faxes that are of the same quality of the original. If the original is sent as a 600 dpi PostScript Fax, that is what is received and printed. This is accomplished by actually sending the other printer a PostScript file instead of a fax image. PostScript Fax to PostScript Fax interaction guarantees top quality images at both ends of the connection.

The LaserWriter Select 360's PostScript Level 2 driver provides for fax communication via the print dialog. This allows any user connected to the LaserWriter Select 360 directly or over the network to fax a document from an application by simply invoking the print command from the file menu. The driver also facilitates the use of an address book feature for frequently used fax destinations.

It is important to understand that by adding the optional fax board when purchasing a LaserWriter Select 360, a business will acquire not

only a fast, networkable, high-quality laser printer, but also a plain paper fax machine that is capable of matching the quality of the original document.

NOTE:
• The PostScript Fax option must be installed by an Apple-authorized service provider.

• The Fax software shipping with the LaserWriter Select 360 Fax option card will not work with 68000-based Macintosh systems. Customers must use the LaserWriter FAX software version 1.0.1 to FAX documents via the 360 and 810 from a 68000 based Macintosh. This new version is not required if the customer is printing from a Macintosh with a 68020 or above.

Ordering Information

LaserWriter Select 360 PostScript Fax Card
Order No. M2345LL/A

Article Change History:
3 December 1993 - Added information on Fax software compatibility with 68000-based Macintosh computers

LaserWriter Select 360: Automatic Language Sensing (10/93)

Revised: 10/19/93
Security: Everyone

LaserWriter Select 360: Automatic Language Sensing (10/93)

==========

Article Created: 5 October 1993

TOPIC ----------

This article discusses Automatic Language Sensing on the LaserWriter Select 360.

DISCUSSION ----------

The LaserWriter Select 360 can use two-page description languages: PostScript and PCL5. If you use a Macintosh computer, your documents are printed using the PostScript language. If you use an IBM PC or compatible computer, your documents may be printed using either PostScript or PCL5. When you send a document to the LaserWriter, a feature called Adobe IntelliSelect (AIS) automatically determines which language is used for the document.

Your printer has three interface ports (LocalTalk, parallel, and serial). Each port can be set up to use AIS or not, as you choose. For example, if you use the printer's LocalTalk port to connect a Macintosh computer, and the parallel port to connect an IBM PC or compatible computer, you can turn AIS off for the LocalTalk port and turn it on for the parallel port. This is because all Macintosh programs print using PostScript, and programs on PCs may use PostScript or PCL5.

Each port has three possible AIS settings:
1. AutoSelect (AIS is turned on)
2. PostScript (AIS is turned off and the port is set to PostScript only)
3. PCL5 (AIS is turned off and the port is set to PCL5 only).

When a port is set to PostScript only, you cannot use it to print PCL5 documents. When a port is set to PCL5 only, you cannot use it to print PostScript documents.

You use the rotary switch on the back of the printer to change the settings of the interface ports. AIS is one of the settings you can change. The switch is set at the factory to position 0, which is what most users will need. To find out what the settings are and how to change them, reference an article titled "Interface Configuration Settings."

LaserWriter Select 360: Automatic Tray Switching (10/93)

Revised: 10/19/93
Security: Everyone

LaserWriter Select 360: Automatic Tray Switching (10/93)

==========

Article Created: 5 October 1993

TOPIC ----------

This article discusses automatic tray switching which is incorporated into the LaserWriter Select 360.

DISCUSSION ----------

When the LaserWriter Select 360 runs out of paper in one tray it can automatically switch between the paper cassette and the multipurpose tray. Using automatic tray switching between the 250-sheet paper cassette and the 50-sheet multipurpose tray, you can print 300 sheets without reloading paper.

You can use automatic tray switching with the optional cassettes, as well.

Tray Switching Default:
A tray switch can occur if and only if the following two criteria are met:
1. The tray it's switching to has the same media (same size paper, transparency, and so on.).
2. The tray it's switching to is not empty.

The possible default switching procedures that can be executed depend on whether the optional 250 or 500 sheet feeder is installed.

If an optional feeder is not installed, the printer, upon running out of paper in either tray, checks the other available tray to see if the tray switching criteria is met. If so, it automatically switches to that tray.

If the optional feeder is installed, the printer, upon running out of paper, checks the other two trays using the following priority: the standard cassette, the multipurpose tray, the optional cassette, and

then the envelope tray. If the first tray checked matches the above criteria, the printer automatically switches to that tray. If it does not, the printer checks the other available tray for a criteria match and switches to it if the criteria is met.

Note: The Multipurpose tray can not be sensed for media type (only for the availability of media) so it is assumed that it contains only the default paper size. The user should not enable automatic tray switching if it is not known whether the multipurpose tray contains paper that matches the default paper size.

LaserWriter Select 360: Automatic Emulation Switching (8/94)

Revised: 8/23/94
Security: Everyone

LaserWriter Select 360: Automatic Emulation Switching (8/94)

==========

Article Created: 1 October 1993
Article Reviewed/Updated: 23 August 1994

TOPIC ----------

This article discusses the automatic emulation switching technology incorporated into the LaserWriter Select 360.

DISCUSSION ----------

The LaserWriter Select 360 has the ability to sense an interface port data stream to determine the start and end of PostScript print jobs, PCL 5 print jobs, PC DOS PrtScn dumps, Hewlett Packard TBCP (Tagged Binary) and raw text dumps. This function is the key to providing simultaneously active ports and seamless switching between PCL 5, PostScript, and raw text printing.

Each interface port has the ability to process either a single emulation or multiple emulations. If an interface port is assigned multiple emulation responsibilities, all data sent to it is processed by the data sensing function. Ports configured for single emulation responsibility have the data sent directly to the assigned emulation processor.

Fonts that are downloaded for specific jobs remain in memory for the PostScript environment and the PCL 5 environment. If the active environment (either PostScript or PCL 5) runs out of virtual memory, inactive downloaded fonts are released as needed to regain enough memory to perform the current job.

The success of automatic emulation switching is tied to the correct usage of the Hewlett-Packard Printer Job Language, the use of PCL 5 print job delimiters, and proper implementations of the Adobe Document Structuring Conventions. Job streams that do not abide by the protocols produce print data that can't be properly sensed and processed.

LaserWriter Select 360: Installing/Loading Multipurpose Tray

Revised: 10/19/93
Security: Everyone

LaserWriter Select 360: Installing/Loading Multipurpose Tray

==========

Article Created: 4 October 1993

TOPIC ----------

Do I need to install the multipurpose tray on my LaserWriter 360?

DISCUSSION ----------

You can use the multipurpose tray to automatically feed envelopes and various sizes of paper into the printer. You don't have to install the tray if you don't want to use it. If you don't want to install it, you can feed individual sheets of paper with the manual feed tray.

The tray fits into the manual feed opening and feeds up to 50 sheets or 5 envelopes.

INSTALLING THE MULTIPURPOSE TRAY

1. Open the flap door (front) of printer as if you're going to do a manual feed.

2. As you're facing the opened flap door, hold the multipurpose tray (folded up), and insert the left side first (see User's Guide for more details).

3. Push the black latch (located on the right side of the manual feed opening) to the left, position the tray, and release the latch.
   Note: You can remove the multipurpose tray by pushing the latch to the left and gently pulling it out.

LOADING THE MULTIPURPOSE TRAY

1. Pull out the extension on the multipurpose tray.

2. Stack the paper on the multipurpose tray and adjust the paper guides so they just touch the paper, but still allow it to lie flat. Again, the multipurpose tray holds and feeds up to 50 sheets

or 5 envelopes. The tray can accept U.S. Legal, A4, U.S. Letter, B5 (JIS), and Executive paper.
Note: Do not stack the paper above the tab (left side) on the multipurpose tray.

LaserWriter Select 360: Interface Configuration Settings 10/93

Revised: 10/19/93
Security: Everyone

LaserWriter Select 360: Interface Configuration Settings 10/93

==========

Article Created: 5 October 1993

TOPIC ----------

Each of the LaserWriter Select 360's interface ports (LocalTalk, serial, and parallel) has some associated configuration parameters that you can set. This article discusses the switch settings.

DISCUSSION ----------

The rotary switch on the back of the printer allows you to easily select one of nine commonly-used interface configurations. If one of these switch positions doesn't meet your needs, you can customize the configuration of switch position 8 using the LaserWriter Utility program for Macintosh or IBM PC and compatible computers.

To change the setting, press the rotary switch. Each time you press, the switch rotates forward or backward one setting. You can change the switch position when the printer is on. The new configuration takes effect within a few seconds. Changing the switch position while a job is being printed may produce unpredictable results.

NOTE: This is NOT a SCSI switch, and the number displayed is not a SCSI ID.

The table that follows summarizes the fixed interface configurations for switch positions 0 through 7, and the factory-default configuration for customizable switch position 8. Switch 9 is reserved. When the printer is turned on with the switch in position 4, an interface configuration page is printed instead of the usual startup page.

Position	Interface	Serial Parameters	Protocol	AIS
0	Serial	9600,N 8,1,DTR	Raw	AutoSelect
	LocalTalk			PostScript
	Parallel		Raw	AutoSelect

1	Serial	9600,N 8,1,DTR	Normal	PostScript
	LocalTalk			PostScript
	Parallel		Normal	PostScript
2	Serial	9600,N 8,1,DTR	Raw	PCL5
	LocalTalk			PostScript
	Parallel		Raw	PCL5
3	Serial	9600,N 8,1,	Normal	PostScript
	LocalTalk	XON/XOFF		PostScript
	Parallel		Raw	AutoSelect
4	Serial	19200,N 8,1,DTR	Normal	PCL5
	LocalTalk			PostScript
	Parallel		Raw	PCL5
5	Serial	19200,N 8,1,DTR	Raw	AutoSelect
	LocalTalk			PostScript
	Parallel		Raw	AutoSelect
6	Serial	19200,N 8,1,DTR	Normal	PostScript
	LocalTalk			PostScript
	Parallel		Normal	PostScript
7	Serial	19200,N 8,1,	Normal	PostScript
	LocalTalk	XON/XOFF		PostScript
	Parallel		Raw	AutoSelect
8	Serial	38400,N 8,1,	Raw	AutoSelect
	LocalTalk	DTR		PostScript
	Parallel		Raw	AutoSelect

Note: In the AIS column in the table above:

- PostScript mean that the port is configured to accept only PostScript jobs.
- PCL5 means that the port is configured to accept only PCL5 jobs.
- AutoSelect means that the port can accept either PostScript or PCL5 and can automatically switch back and forth between them.

LaserWriter Select 360: Q & A (6/96)

Revised: 6/20/96
Security: Everyone

LaserWriter Select 360: Q & A (6/96)

==========

Article Created: 4 October 1993
Article Reviewed/Updated: 20 June 1996

TOPIC -----

This article answers questions on the LaserWriter Select 360 printer.

DISCUSSION -----

Q: Does the LaserWriter Select 360 replace the Personal LaserWriter NTR?
A: Yes, the LaserWriter Select 360 is a feature enhanced replacement for the Personal LaserWriter NTR. It offers advanced print quality (FinePrint and true 600 x 600 dots per inch printing) an optional PostScript Fax card for full fax send and receive capability (at up to 600 dpi if communicating with a similarly capable PostScript Fax printer), and a RISC-processor controlled 10 page-per-minute engine.

Q: Is the LaserWriter Select 360 a PostScript printer?
A: Yes. The LaserWriter Select 360 uses Adobe PostScript Level 2. It also offers PCL 5 (Hewlett-Packard LaserJet III emulation) for non-PostScript PC users. PC-DOS PrtScn and HP's Tagged Binary (TBCP) are also available.

Q: What is the print speed of LaserWriter Select 360?
A: Depending on the application and the complexity of the document being printed, the printer is designed to print up to 10 ppm.

Q: What are the paper handling capabilities?
A: Paper input capacity is 250 sheets and can be expanded to support an additional 50, 250, or 500 sheets of paper. When all the paper handling options are installed the printer can have up to 800 sheet input capacity.

Q: Is the LaserWriter Select 360 compatible with the LaserWriter Select 300/310 toner cartridge and accessories?
A: No. The LaserWriter Select 360 is based on a new 600 dpi print

engine. It is not compatible with the LaserWriter Select 300/310 toner cartridge.

Q: Is there a LaserWriter Select 360 upgrade for the LaserWriter Select 300 and 310?
A: No. Due to severe schedule restrictions and low customer demand for past upgrade options, there is no planned upgrade path from the LaserWriter Select 300 or 310.

Q: Can the LaserWriter Select 360 be upgraded to a LaserWriter Pro 630?
A: No, the LaserWriter Pro 630 is based on an entirely different engine.

Q: Won't the LaserWriter Select 360 impact LaserWriter Pro 600 sales?
A: Yes, because of the faster engine and equivalent resolutions, automatic emulation switching and the optional PostScript Fax capability. The LaserWriter Pro 600 will still be available because of the upgrade path it provides to the LaserWriter Pro 630.

Q: Is the LaserWriter Select 360 memory upgradeable?
A: Yes, a user can upgrade the memory by replacing the 72-pin 4 MB SIMM with a 72-pin 16 MB SIMM. This upgrade boosts the usable RAM from 7 MB to 16 MB. The 3 MB of RAM on the logic board is not used when a 16 MB SIMM is installed.

Q: Why isn't PhotoGrade supported in the LaserWriter Select 360?
A: Due to severe schedule restrictions and some engineering difficulties with 300 dpi PhotoGrade quality, the option was not included.

Q: What expansion options are available for the printer?
A: The expansion options include the PostScript Fax card for plain paper fax capability and various paper handling accessories which provide an input capacity of up to 800 sheets.

Q: Does the LaserWriter Select 360 support LocalTalk?
A: Yes. The LaserWriter Select 360 was designed to be an upgraded version of the Personal LaserWriter NTR and as such, supports LocalTalk, serial and parallel interfaces.

Q: Does the LaserWriter Select 360 printer support TrueType?
A: Yes, the ROM includes the TrueType scaler and the disk set includes 64 TrueType font faces.

Q: Is the LaserWriter Select 360 compatible with ATM (Adobe Type Manager)?
A: Yes, ATM and TrueType can both be used.

Q: When QuickDraw GX is available will the LaserWriter Select 360 support it?
A: As soon as QuickDraw GX is available Apple will add the appropriate driver to the in-box materials and modify the Installer script to install the appropriate driver depending on the system software present on the user's Macintosh.

Q. Who is the target customer?

A. The LaserWriter Select 360 is targeted for small to medium workgroups, small to mainstream businesses and power users who need high-quality, high-performance and network capability. The PostScript Fax option is ideal for each of the target customer segments.

Q. How much faster is the LaserWriter Select 360 than the Personal LaserWriter NTR?
A. The answer to that depends on the complexity of the print job, and the size of the file form which you print. On average, a LaserWriter Select 360 will image 60% faster than a Personal LaserWriter NTR.

Q. What print quality capabilities are available?
A. Users can select 300x300 dpi or 600x600 dpi. FinePrint can be employed in 300x300dpi.

Q. What fonts are in the printer?
A. All standard 35 Type 1 fonts for PostScript applications in UNIX, Windows, and Macintosh applications are ROM resident.

Q. Does the printer support automatic emulation switching?
A. Yes, it supports automatic emulation switching. If the data stream being sent to a port follows standards for each emulation, it can detect emulation switching needs and correctly route the data to the proper emulation logic.

Q. Does it support PCL Level 5 (HP LaserJet III emulation)?
A. Yes.

Q. What processor does the LaserWriter Select 360 use?
A. The processor is a RISC based AMD 29200 15 MHz chip.

Q. What kind of RAM does it use?
A. The LaserWriter Select 360 uses 72-pin, 80 ns, fast page mode DRAM. Three 1 MB banks of memory are soldered to the logic board. One 72-pin SIMM holds a 4 MB SIMM which may be replaced with a 16 MB SIMM.

Q. What RAM configurations are possible?
A. The LaserWriter Select 360 is equipped with 7 MB standard, and can be upgraded with one 16 MB SIMM (which replaces the 4 MB SIMM) to provide a maximum of 16 MB RAM. In the 16 MB configuration, the 3 MB of on-board DRAM are unused.

Q. How much ROM and RAM are standard?
A. 4 MB ROM and 7MB RAM.

Q. Does Apple include software for Windows users?
A. Yes. We have drivers to support Windows 3.0 and Windows 3.1.

Q. Does the LaserWriter Select 360 have duplex printing capability?
A. No.

Q. How does the LaserWriter Select 360 compare with the HP LaserJet 4M or 4P?

A. At this time, it is the only mainstream laser printer that offers the PostScript Fax option. Otherwise, the LaserWriter Select 360 and the Hewlett-Packard LaserJet 4M have similar features and abilities. The LaserWriter Select 360 has a faster engine than the HP LaserJet 4P (10 ppm to 4 ppm). All three printers have all ports active interfaces with automatic emulation switching capability.

LaserWriter Select: Toner Cartridge Compatiblilty (11/95)

==========

Article Created: 4 October 1993
Article Reviewed/Updated: 7 November 1995

TOPIC ----------

Is the LaserWriter Select 300/310 toner cartridge compatible with the LaserWriter Select 360 printer?

DISCUSSION ----------

The LaserWriter Select 360 is based on a new 600 dpi print engine, and it is not compatible with the original LaserWriter Select 300/310 toner cartridge (M2029G/A). However, a universal LaserWriter Select toner cartridge (M1960G/A) is compatible with the LaserWriter Select 360, LaserWriter Select 310, and LaserWriter Select 300 printers. The universal LaserWriter Select toner cartridge is also compatible with the LaserWriter Select 610, which is only available outside the United States.

LaserWriter Select 360: Upgrading Printer Memory (2/95)

Revised: 2/22/95
Security: Everyone

LaserWriter Select 360: Upgrading Printer Memory (2/95)

==========

Article Created: 4 October 1993
Article Reviewed/Updated: 22 February 1995

TOPIC ----------

Can I upgrade my LaserWriter Select 360 with more memory?

DISCUSSION ----------

Yes, the LaserWriter Select 360 can be upgraded with more RAM (memory), which lets you print more complex documents and improves performance on documents that contain many fonts.

The printer's standard memory size is 7 MB (megabytes), 4 MB of which are contained on a removable SIMM (Single Inline Memory Module). The printer may be upgraded to 16 MB total (the largest size supported by the printer) by removing the 4 MB SIMM and replacing it with a 16 MB SIMM. The remaining 3 MB of memory is disabled by the controller whenever a 16 MB SIMM is installed.

The 16 MB SIMM may be purchased from your Apple-authorized Service Provider. SIMMs must meet the following specifications:

- Size: 16 MB (4 Mbit x 32 bit)
- Access Time: 80 ns or less
- SIMM Type: 72-pin
- Refresh: 2K Row (11 bit x 11 bit)

There are a wide range of 16MB SIMMs available. Just because a 16MB SIMM is being used does not mean that it is the correct one for use in the LaserWriter Select 360. Contact the SIMM vendor to confirm that the proper SIMM is being used.

Article Change History:
22 Feb 1995 - Added keyword; made minor technical updates.

Article Reviewed/Updated: 22 February 1994

TOPIC ----------

This article describes the LaserWriter 360.

DISCUSSION ----------

The LaserWriter Select 360 printer is a low-cost, high performance printer that features a 10 page-per-minute (ppm) engine. The first thing you'll notice about the LaserWriter Select 360 is its outstanding print quality. Offering 600-dot-per-inch (dpi) resolution, the LaserWriter Select 360 produces consistently superior output with crisp text, rich graphics and perfect curves.

The LaserWriter Select 360, which is based on an AMD 29200 RISC microprocessor, is significantly faster than the Personal LaserWriter NTR, and approximately 16% faster than the LaserWriter Pro 630. It has LocalTalk, RS-232, and parallel (Centronics) ports, but no SCSI port for attaching an external hard drive.

Whether you use Macintosh, Windows, or MS-DOS computers, the LaserWriter Select 360 provides the plug-and-play simplicity you need. All ports stay active simultaneously, so the printer can accept jobs from all types of computers without you having to change a single setting. The LaserWriter Select 360 also automatically switches between PostScript Level 2 and PCL 5 languages.

When you add the PostScript Fax Card, the LaserWriter Select 360 offers another big advantage, you can use it to receive and send faxes as easily as you can print from both Macintosh and Windows computers. What's more, you can print them on plain paper at up to 600-dpi resolution. Everyone on the network can use the LaserWriter Select 360 to send faxes to any PostScript or standard Group 3 fax machine and know they'll arrive looking their best.

With two versatile paper trays built-in, plus an optional third tray, the LaserWriter Select 360 supports a total paper capacity of 800 sheets.

FEATURES:

Print quality

- 600-dot-per-inch (dpi) resolution for high quality text and graphics -- even with the standard RAM configuration.
- 64 scalable fonts

Performance

- Up to 10 page-per-minute print speed
- AMD Am29200 RISC processor
- EPA Energy Star compliant; automatic sleep mode when the printer is idle

Target Customer

- Small to medium workgroups in Macintosh and mixed Macintosh/Windows environments

Optional PostScript fax capability

- Optional PostScript Fax Card for adding plain-paper fax capability to the printer
- Allows all Macintosh and PC users on a network to send and receive faxes at up to 600 dpi

Compatibility

- Simple plug-in connection to Macintosh, MS-DOS, and Windows computers
- Simultaneous connection to parallel, LocalTalk, and serial ports
- Automatic emulation switching between PostScript Level 2 and PCL 5

Paper handling

- Two paper trays included (50 and 250 sheet capacity)
- Optional 250 or 500 sheet tray
- Maximum capacity with options: 800 sheets
- Paper sizes: Supports U.S. letter, U.S. legal, A4, B5, Labels, envelopes, most textured stock and transparencies

Interfaces

- Simultaneous connection to parallel, LocalTalk, and RS-232 serial interfaces
- Connector for optional PostScript Fax Card

Fonts

• Apple Font Library (64 fonts total)
—35 fonts in ROM from the following font families:
Avant Garde, Bookman, Courier, Helvetica, Helvetica Narrow, New Century Schoolbook, Palatino, Symbol, Times, Zapf Chancery, and Zapf Dingbats
—29 fonts on Macintosh disk from the following font families: Chicago, Delphian, Garamond Narrow, Geneva, Helvetica Black, Helvetica Compressed, Lubalin Graph, Lucida Bright, Machine, Monaco, Nadianne, New York, Old English Text, Onyx, Oxford, Swing, and Zeal

• Compatible with any TrueType or PostScript font

Centris Series: Replaced by Similar Quadra Models (10/93)

==========

Article Created: 21 October 1993

TOPIC ----------

What became of the Centris 610, Centris 650, and Centris 660AV?

DISCUSSION ----------

On 21 October 1993, the Centris name was discontinued, and the three Centris models were replaced by three Macintosh Quadra models.

The Quadra 610 and 650 offer improved performance compared to the Centris models they replace. Separate Tech Info Library articles list the differences between the Centris 610 and the Quadra 610, and between the Centris 650 and the Quadra 650. The Centris 660AV and the Quadra 660AV are identical.

Apple External Hard Drive: Description (9/94) (Discontinued)

==========

Article Created: 27 September 1993
Article Reviewed/Updated: 23 May 1995

TOPIC ----------

This article describes the Apple External Hard Drive.

NOTE:
This drive was never released or supported by Apple Computer, Inc. LaCie sold this drive in multiple hard drive sizes, and provided all support for it.

The Tech Info Library article titled "Locating Vendor Information" can help you search for a particular vendor's address and phone number.

DISCUSSION ----------

The Apple External Hard Drive provides Macintosh owners with a convenient, easy storage upgrade option that comes in capacities of up to 1 gigabyte. It incorporates design and support features that make it the clear choice for additional storage capacity for your computer—or additional font storage for your laser printer.

Featuring a flexible, aesthetic design, the Apple External Hard Drive can be set up either vertically or horizontally. Its front-panel controls make it convenient to use no matter how it’s positioned.

To help you get started quickly, the Apple External Hard Drive includes everything you need to set it up. It’s packaged with a power cable, a SCSI cable, and even a terminator. In addition, the drive comes with a variety of utility software, so operation is also a snap. Programs include an easy-to-use setup function, powerful disk-repair utilities, file-compression software, and even a comprehensive backup utility to ensure the continued safety and security of your files.

FEATURES

Front-panel controls

- Provides unique front-panel SCSI ID display, which makes it easy to check or change SCSI ID as needed
- Offers front-panel power-on switch for easy operation

Bundled utility software

- Comes with easy setup program
- Includes powerful disk-repair utilities
- Enables data compression for storage efficiency
- Provides comprehensive backup capacity

Rapid, reliable service options

- Lets you call a toll-free number for support as needed
- Provides for repairs by Apple-authorized service professionals

Convenience

- Comes with everything required to get it running right away; includes power cable, SCSI cable, and terminator

Compatibility

- Supports Macintosh SE 30 and later models — no potential problems or need for complicated retrofits

System software

- Bundled software requires system software version 6.0.5 or later

System requirements

- Any Apple Macintosh computer with a SCSI connector

Ethernet and Twisted-Pair NB Card: Description (10/93)

==========

Article Created: 21 October 1993

TOPIC ----------

This article describes the Apple Ethernet NB Card and Apple Ethernet NB Twisted-Pair Card and it's features.

DISCUSSION ----------

The Apple Ethernet NB Cards (Apple Ethernet NB Card and Apple Ethernet NB Twisted-Pair Card) provide Macintosh II and Macintosh Quadra computers with the ideal Ethernet connectivity solution for all of your networking needs.

The Apple Ethernet NB Card is a NuBus master network interface card that has its own 68000 microprocessor and includes an Apple Ethernet port. With the appropriate Apple Ethernet cable system media adapter, which plugs into the port, you can connect to any standard Ethernet cabling environment: thin coax Ethernet networks, using the Apple Thin Coax Transceiver; and thick coax or other media (such as fiber-optic cable) Ethernet networks, using the Apple Ethernet AUI Adapter.

The Apple Ethernet NB Twisted-Pair Card is a bus master network interface card that includes a built-in, industry-standard, 10Base-T network port. When used in conjunction with an unshielded twisted-pair cable and an IEEE-compatible hub, it allows you to connect to IEEE 802.3 10Base-T networks.

These convenient, easy-to-install cards feature uncompromised network performance and afford the flexibility of connection to any standard Ethernet media. They support a variety of net-working protocols, including AppleTalk, TCP/IP, Mac IPX, and DECnet, and offer seamless interoperability in multivendor environments.

Features

Ease of use

- Takes only minutes to install
- Includes all the necessary software

Compatibility
- Works with all Macintosh II and Macintosh Quadra models
- Complies with IEEE 802.3 standards
- Supports a variety of popular networking protocols, including AppleTalk, TCP/IP, Mac IPX and DECnet
- Easily integrates into multivendor environments
- Adapts to any standard Ethernet cable environment using the appropriate Apple Ethernet cable system media adapter (Ethernet NB Card)

High performance
- Allows concurrent execution of multiple networking protocols to optimize network performance
- Offers the highest available network buffer memory
- Features a robust, multiprocessor, bus master architecture (Ethernet NB Card)

Convenience
- Makes it easy to administer and troubleshoot the network
- Lets you take advantage of existing unshielded twisted-pair cabling (Ethernet NB Twisted-Pair Card)

Reliability
- Offers high network reliability because of the point-to-point nature of 10Base-T networks (Ethernet NB Twisted-Pair Card)

This article provides the specifications and order information of the Apple Ethernet NB Card and Apple Ethernet NB Twisted-Pair Card.

DISCUSSION ----------

Apple Ethernet NB Card Technical Specifications

Connector
• Apple Ethernet

Transmit/receive data rate
• 10-megabit-per-second maximum data rate

Processor
• 10-MHz Motorola 68000

RAM
• 512K standard

Environmental requirements
• Operating temperature: 50° to 104° F (10° to 40° C)
• Humidity: 20% to 95% noncondensing, at a temperature range of 77° to 104° F (25° to 40° C)

Power dissipation
• 7.5 W or less (average is 4 W)

Ethernet controller
• National Semiconductor DP83932

System requirements
• One available NuBus slot; NuBus adapters required for the Macintosh IIsi

and Macintosh Quadra 610
• Appropriate Apple Ethernet cable system media adapter

Apple Ethernet NB Twisted-Pair Card Technical Specifications

Connector
• Ethernet 10Base-T compliant RJ-45 port

Transmit/receive data rate
• 10-megabit-per-second maximum data rate

RAM
• 128K standard

Environmental requirements
• Operating temperature: 50° to 104° F (10° to 40° C)
• Humidity: 20% to 95% noncondensing at a temperature range of 77° to 104° F (25° to 40° C)

Power dissipation
• 3.75 W or less (average is 2 W)

Ethernet controller
• National Semiconductor DP83934-SONIC-T

System requirements
• One available NuBus slot; NuBus adapters required for the Macintosh IIsi and Macintosh Quadra 610
• Unshielded twisted-pair cable
• IEEE 802.3-compatible 10Base-T hub

External Hard Drive Update: Positioning Horizontally (2/95)

Revised: 2/2/95
Security: Everyone

External Hard Drive Update: Positioning Horizontally (2/95)

==========

Article Created: 27 September 1993
Article Reviewed/Updated: 02 February 1995

TOPIC ----------

This article gives updated information about positioning the hard disk horizontally and attaching the feet on the Hard drive.

DISCUSSION ----------

The Apple External Hard Drive can be positioned vertically or horizontally. However, pages 3 and 4 of the Apple External Hard Drive User's Guide contain some outdated information about positioning the hard disk horizontally.

To position the hard disk horizontally, DO NOT attach the feet. Apple DOES NOT recommend stacking one hard disk on top of another.

The information about positioning the hard disk vertically is still correct.

PowerBook Duo 250: Description (Discontinued)

==========

Article Created: 21 October 1993
Article Reviewed/Updated: 14 March 1995

TOPIC ----------

This article describes the Apple PowerBook Duo 250 computer.

DISCUSSION ----------

The PowerBook Duo 250 offers a high-speed processor, an active matrix screen, large RAM expansion, and desktop expansion in a package that weighs 4.2 pounds. It features a 68030 microprocessor that runs at 33 megahertz, and supports up to 24 megabytes of RAM. The PowerBook Duo 250 also includes a 9-inch (229-millimeter) backlit, active-matrix display.

The PowerBook Duo 250 can be transformed into a desktop Macintosh by attaching it to an optional PowerBook Duo Dock or MiniDock. You can then work with a large color display, expanded keyboard, printers, and network servers.

Features

Power and speed

• 33-MHz 68030 microprocessor

Memory

• 4MB of RAM, expandable to 24MB

Display

• Bright, backlit, active-matrix display (640 by 400 pixels)
• Full-page-width, 9-in. diagonal; 16-level gray scale
• Adjustable brightness and contrast controls

Battery life

• 2.5 to 6 hours on a single charge

Expansion

• Built-in high-speed serial port for peri-pheral devices, including LocalTalk network and printers
• Slots for internal modem and RAM
• Docking connector
• Optional PowerBook Express Modem

Usability

• Runs thousands of Macintosh applications
• Easy to set up, learn, use, and expand

System software

• System software version 7, with multitasking, file sharing, Balloon Help, TrueType fonts, and more

Networking

• Built-in LocalTalk networking
• File sharing without a dedicated server

Compatibility

• Reads and writes Macintosh, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats with appropriate software

Ordering Information

PowerBook Duo 250: Technical Specifications (10/93)

==========

Article Created: 21 October 1993

TOPIC ----------

This article provides the technical specifications for the Apple PowerBook Duo 250.

DISCUSSION ----------

Microprocessor

- Motorola 68030, running at 33 MHz

Memory

- Comes with 4MB of RAM
- Can be expanded to up to 24MB of RAM with PowerBook Duo 4MB or 8MB Memory Expansion Kits, or third-party memory expansion cards

Disk Drive

- One internal 200MB hard disk

Display

- 9-in. (229-mm) diagonal
- Backlit, active-matrix display, 640 by 400 pixels
- 16 shades of gray

Battery

- Nickel-metal-hydride High Capacity Type II battery provides 2.5 to 6 hours of computer use before recharging is necessary
- EverWatch Battery Saver technology

Keyboard

- Built-in, 2.5-mm travel, 18-mm pitch
- Two-level tilt adjustment
- LED light when caps lock is engaged

Trackball

- 19-mm diameter, dual-button trackball

Clock/Calendar

- CMOS custom-integrated circuit with long-life lithium battery

Microphone

- Built-in omnidirectional electret; output voltage of 4 mV, peak-to-peak, at normal volume

Interfaces

- Power adapter port
- 152-pin PDS connector for connecting PowerBook Duo Dock, PowerBook Duo MiniDock, PowerBook Floppy Adapter, or other expansion devices
- RS-422 serial port for LocalTalk networking, printers, modems, and other devices
- Port for optional internal modem

File-Transfer Options

- LocalTalk cables and System 7 file sharing
- Serial cable and System 7 file sharing
- Fax/data modem and AppleTalk Remote Access software
- Duo MiniDock with external Apple SuperDrive, SCSI Disk Adapter, and HDI-30 SCSI system cable
- Duo Dock internal Apple SuperDrive, optional internal hard drive, and HDI-30 SCSI system cable

Docking Options

- PowerBook Duo Dock
- PowerBook Duo MiniDock
- PowerBook Duo Floppy Adapter
- Docking solutions from third-party vendors

Modem

- Optional internal PowerBook Express Modem; sends and receives data at 14,400 bps and sends and receives faxes at 9,600 bps. Includes Express Fax software.

Subframe

- Magnesium subframe structural rigidity and heat sink

Sound Generator

- Built-in speaker
- Apple Sound Chip provides monophonic 8-bit sound and is capable of driving stereo headphones or other stereo equipment with the same signal supplied to both channels through optional PowerBook Duo Dock or PowerBook Duo MiniDock

Sound Input

- 4-voice sound with 8-bit analog-to-digital conversion recording at 11 or 22 kHz sampling rate

Disability Access

- CloseView, Easy Access, and visible-beep included with system software. These built-in solutions and third-party options provide alternative input and output devices for people with disabilities.

Electrical Requirements

- Line voltage: 85 to 270 VAC, RMS single phase, automatically configured
- Frequency: 47 to 63 Hz, single phase
- Power: 25 W maximum

ADB Power Requirements

- Maximum current draw for all ADB devices is 200 mA (a maximum of three ADB devices is recommended)

Size and Weight

- Thickness: 1.4 in. (3.6 cm)
- Width: 10.9 in. (27.7 cm)
- Depth: 8.5 in. (21.6 cm)
- Weight: 4.2 lb. (1.9 kg)

Operating Environment

- Operating temperature: 50° to 104° F (10° C to 40° C)
- Storage temperature: –40° to 116° F (–40° C to 47° C)
- Relative humidity: 20% to 80% noncondensing
- Operating altitude: 0 to 10,000 ft. (0 to 3,048 m)
- Maximum storage altitude: 15,000 ft. (4,722 m)

PowerBook Duo 270c: Description (Discontinued)

==========

Article Created: 21 October 1993
Article Reviewed/Updated: 14 March 1995

TOPIC ----------

This article describes the Apple PowerBook Duo 270c computer.

DISCUSSION ----------

The PowerBook Duo 270c is Apple’s top-of-the-line color PowerBook Duo computer and is the industry’s first 16-bit color notebook. It has a 8.4-inch, backlit, active-matrix color display which can display thousands of colors. Yet the PowerBook Duo 270c weighs just 4.8 pounds and fits easily into a briefcase.

The PowerBook Duo 270c combines the power of a 33-megahertz 68030 microprocessor with an additional math coprocessor, and supports up to 32 megabytes of RAM.

The PowerBook Duo 270c can be transformed into a desktop Macintosh by attaching it to an optional PowerBook Duo Dock or MiniDock. You can then work with a large color display, expanded keyboard, printers, and network servers.

Features

Power and speed

• 33-MHz 68030 microprocessor
• 33-MHz 68882 math coprocessor

Memory

• 4MB of RAM, expandable to 32MB

Display

• Bright, backlit, active-matrix display

- 8.4-in. diagonal
- Two display modes: 640 by 400 with thousands of colors; 640 by 480 with 256 colors

Battery life

- 2 to 4 hours on a single charge

Expansion

- Built-in high-speed serial port for peripheral devices, including LocalTalk network and printers
- Slots for internal modem and RAM
- Docking connector
- Optional PowerBook Express Modem

Usability

- Runs thousands of Macintosh applications
- Easy to set up, learn, use, and expand

System software

- System software version 7, with multitasking, file sharing, Balloon Help, TrueType fonts, and more

Networking

- Built-in LocalTalk networking
- File sharing without a dedicated server

Compatibility

- Reads and writes Macintosh, Windows, MS-DOS, OS/2, and ProDOS floppy disk formats with appropriate software

PowerBook Duo 270c: Technical Specifications (Discontinued)

==========

Article Created: 21 October 1993

TOPIC ----------

This article provides the technical specifications for the Apple PowerBook Duo 270c.

DISCUSSION ----------

Microprocessor

- Motorola 68030, running at 33 MHz
- 68882 math coprocessor, running at 33 MHz

Memory

- Comes with 4MB of RAM
- Expands to up to 32MB of RAM with the addition of PowerBook Duo 4MB or 8MB Memory Expansion Kits, or third-party memory expansion cards

Disk Storage

- One internal 240MB hard disk

Display

- 8.4-in. diagonal
- Backlit, active-matrix, color liquid crystal display, 640 by 480 pixels
- Two display modes: 640 by 400 with thousands of colors; 640 by 480 with 256 colors
- LED indicator when computer is in sleep mode

Battery

- Nickel-metal-hydride High Capacity Type II battery provides 2 to 4 hours of computer use before recharging is necessary

- EverWatch Battery Saver technology

Keyboard

- Built-in, 2.4-mm travel, 18-mm pitch
- Two-level tilt adjustment
- LED light when caps lock is engaged

Trackball

- 19-mm diameter, dual-button trackball

Clock/Calendar

- CMOS custom-integrated circuit with long-life lithium battery

Microphone

- Built-in omnidirectional electret; output voltage of 4 mV, peak-to-peak, at normal volume

Interfaces

- Power adapter port
- 152-pin PDS connector for connecting PowerBook Duo Dock, PowerBook Duo MiniDock, PowerBook Floppy Adapter, or other expansion devices
- RS-422 serial port for LocalTalk networking, printers, modems, and other devices
- Port for optional internal modem

File-Transfer Options

- LocalTalk cables and System 7 file sharing
- Serial cable and System 7 file sharing
- Fax/data modem and AppleTalk Remote Access software
- Duo MiniDock with external Apple SuperDrive, SCSI disk adapter, and HDI-30 SCSI system cables
- Duo Dock internal Apple SuperDrive, optional internal hard drive, and HDI-30 SCSI system cable

Docking Options

- PowerBook Duo Dock
- PowerBook Duo MiniDock
- PowerBook Floppy Adapter
- Docking systems from third-party vendors

Modem

- Optional internal PowerBook Express Modem; sends and receives data at 14,400 bps and sends and receives faxes at 9,600 bps. Includes Express Fax software.

Magnesium Subframe

• Provides structural rigidity and heat sink

Sound Generator

• Built-in speaker
• Apple Sound Chip provides monophonic 8-bit sound and is capable of driving stereo headphones or other stereo equipment with the same signal supplied to both channels through any optional PowerBook Duo Dock or PowerBook Duo MiniDock

Sound Input

• 4-voice sound with 8-bit analog-to-digital conversion recording, sampled at 11 or 22 kHz

Disability Access

• CloseView, Easy Access, and visible-beep included with system software. These built-in solutions and third-party options provide alternative input and output devices for people with disabilities.

Electrical Requirements

• Line voltage: 85 to 270 VAC, RMS single phase, automatically configured
• Frequency: 47 to 63 Hz, single phase
• Power: 25 W maximum

ADB Power Requirements

• Maximum current draw for all ADB devices is 100 mA with Powerbook Duo MiniDock or PowerBook Floppy Adapter or 500 mA with PowerBook Duo Dock (a maximum of three ADB devices is recommended)

Environmental Requirements

• Operating temperature: 50° to 104° F (10° to 40° C)
• Storage temperature: –13° to 140° F (–25° to 60° C)
• Relative humidity: 20% to 80% noncondensing
• Operating altitude: 0 to 10,000 ft. (0 to 3,048 m)
• Maximum storage altitude: 15,000 ft. (4,722 m)

Size and Weight

• Thickness: 1.5 in. (3.8 cm)
• Width: 10.9 in. (27.7 cm)
• Depth: 8.5 in. (21.6 cm)
• Weight: 4.8 lb. (2.2 kg)

PowerBook Duo 250 and 270c: Upgrades (6/94)

Revised: 6/22/94
Security: Everyone

PowerBook Duo 250 and 270c: Upgrades (6/94)

==========

Article Created: 21 October 1993
Article Reviewed/Updated: 11 May 1994

TOPIC ----------

This article discusses upgrades options for Macintosh PowerBook Duo 250 and 270c computers.

DISCUSSION ----------

The PowerBook Duo 250 can be upgraded to the Duo 280 and the PowerBook Duo 270c can be upgraded to the Duo 280c through a logic board upgrade. The Duo 280 upgrade replaces the Duo 250's logic board with Duo 280 logic board. Upgrade from a black and white display to an active-matrix color display is not available.

The Duo 280 logic board upgrade does not include a replacement display bezel and as a result, the unit will show the older model name after the upgrade. It is possible to identify an upgraded system by a newer FCC identification label affixed to the bottom of the unit.

To upgrade your PowerBook Duo in the United States, contact the Apple Assistance Center at 1-800-SOS-APPL, service providers cannot perform either upgrade. In other countries, contact your local Apple authorized service provider.

Article Change History:
22 Jun 1994 - Clarified wording, noted that upgrade must be performed at Apple.
11 May 1994 - Updated to include info for Duo 280 and Duo 280c upgrades and remove Duo 250 logic board upgrade which was discontinued.
04 May 1994 - Updated to remove information regarding Duo 270c upgrade which was discontinued

PowerBook Duo: Battery Reconditioning (12/94)

Revised: 12/6/94
Security: Everyone

PowerBook Duo: Battery Reconditioning (12/94)

==========

Article Created: 21 October 1993
Article Reviewed/Updated: 06 December 1994

TOPIC ----------

This article discusses battery reconditioning for the PowerBook Duo 270c, Duo 280, and Duo 280c.

DISCUSSION ----------

Battery reconditioning is a deep discharge of a battery to avoid “memory effect” which, over time, can reduce the battery's power capacity.

The PowerBook Duo 270c, Duo 280, and Duo 280c have a modified power system which can recondition its battery. This allows it to draw power exclusively from either the AC source or the main batteries. When you recondition the battery, the Duo disconnects external power to avoid recharging, draws power from the internal battery only, and ignores all low power level alerts, including hardware shutdown. The Duo then senses when the battery is completely exhausted and fully recharges it. The entire process should take a few hours.

During battery reconditioning, you cannot use the Duo for any other purpose. While the Duo is reconditioning its battery, it goes into a screen saver mode where a black and white battery icon moves around the screen. Note that the power adapter must be plugged in for reconditioning to work.

You should recondition your battery no more than once a month. The battery reconditioning software (located on the Disk Tools diskette) keeps track of the last reconditioning performed by checking the battery's serial number. PowerBook systems prior to the Duo 270c, Duo 280, or Duo 280c cannot use the battery reconditioning software.

Please note that the Battery Reconditioning software is not on the system diskettes that come with the PowerBook Duo. You should make a backup of your software or download the software from one of the online services.

These articles can help you locate software updates mentioned here:

- Where To Find Apple Software Updates
  Lists online services for "free" Apple software updates

- Obtaining Apple Product Support in the USA
  Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library

Article Change History:
06 Dec 1994 - Noted that Battery Recond. software is not on system disks.
05 May 1994 - Updated to include PowerBook 280 and 280c products

Macintosh Hardware System Update 2.0: Components (10/93)

Revised: 1/26/95
Security: Everyone

Macintosh Hardware System Update 2.0: Components (10/93)

==========

Article Created: 19 October 1993

TOPIC ----------

The Macintosh Hardware System Update provides software improvements and enhancements for Macintosh systems. The update requires Macintosh System Software version 7.1, and isn't intended for Macintosh Performa users. This article describes the components of this update.

DISCUSSION ----------

The Hardware System Update is distributed on a single 1.4 high-density floppy disk. The disk includes a simple Installer program which allows users to install files in the System Folder. The Installer automatically determines which enhancements are appropriate for your computer. To install the update, double-click on the Hardware System Update Read Me icon and follow the steps listed there. Note: The Connectix Enabler Patch may interfere with the Hardware System Update 2.0. You should remove it before installing the update.

The Apple Macintosh Hardware System Update is licensed to customers free of charge through 40 on-line services, including America-Online and CompuServe. Normal connect and/or download charges apply. User groups that make the update available may charge for duplication.

Files on the Hardware System Update

The single 1.4MB high density disk contains the following listed files. Please note that the Installer only installs those files appropriate to your specific computer.

- Hardware System Update 2.0 extension (6K)
- Hardware System Update Read Me (3K)
- Memory Control Panel 7.1.1 (39K)
- The PowerBook Display Control Panel 1.0.4 (33K)
- The PowerBook Control Panel 7.1.2 (62K)

This feature includes new versions of the PowerBook Display Control Panel (version 1.0.4) and the PowerBook Control Panel (version 7.1.2).
- System Enabler 131 1.0.2 for PowerBooks (45K)
- Express Modem 1.0.4 (296K)
  Supports a broader range of standard communications packages.
- Express Modem Tool 1.0.2 (53K)
  Supports a broader range of standard communications packages.
- DiskInit Extension (41K)
- Record Button extension [Apple Adjustable Keyboard] (6K)
- System Enabler 401 v1.0.5 (28K)
  This enables adding the Apple IIe Card and software to the Macintosh Color Classic. In addition, the System Enabler improves mouse performance on the Color Classic.
- Apple Adjustable Keyboard resources (3K)
  This feature allows users to connect the keyboard to any Macintosh computer without separately installing special keyboard software.
- Sound Control Panel 8.0.1 (32K)
- GrayShare serial driver patches [shipped with StyleWriter II software] (90K)
- HDSC Setup 7.2 (82K)
  This feature gives more flexibility to format large hard disks between 1 and 2 gigabytes.
- Disk First Aid 7.1.1 (47K)
  This is an updated version of the utility that repairs damaged disks. The new version repairs hard disks which may appear to be damaged, but aren't really damaged.
- Sound Manager 3.0 (95K)
  This feature enhances sound performance on most Macintosh computers (all models except Macintosh Plus, SE, and Classic).
- Installer 3.4 (141K)
- Install Script (3K)
- TeachText 7.1 (36K)
- 720KB Floppy Disk Formatter Extension.
  This feature allows users to format low-density (double-sided) floppy disks as 720K MFM disks. This feature is included to support certain third-party floppy disk drives.

Improvements in Version 2.0

Here's a list of improvements:

- Improves system memory management by storing fonts in the computer's memory more efficiently.
- Solves problems sometimes encountered when using the Apple Basic Color monitor with Macintosh Centris and Quadra computers. (The monitor may appear to be green or a washed-out blue color.)
- Removes horizontal white lines which may appear on Macintosh Centris and Quadra computers with a Macintosh 16-inch Color Display. (Horizontal white lines appear when users are scrolling through text.)
- Corrects certain problems users may have when manipulating large data items (greater than 8MB) in high-end graphics or multimedia

applications. Macintosh models affected: Macintosh IIci, IIfx, all Macintosh Quadra computers, all Macintosh Centris computers, and Macintosh PowerBooks in 32-bit mode.
- Corrects certain problems with cursor/mouse coordination. Removes difficulties when the cursor and mouse do not track together properly. Macintosh models affected: Macintosh Centris 610 and 650, Quadra 800, and Macintosh LC III.
- Corrects incompatibilities with certain utilities and some applications. Fixes crashing problems users may have with Connectix PowerBook Utilities, Suitcase 2.1.2, and ATM 3.0.
- Adds additional support for GrayShare and the StyleWriter II printer. Provides better printer and serial performance with GrayShare and the StyleWriter II printer in applications that take advantage of new serial driver support.

Features from the Hardware System Update 1.0

Here's a list of improvements retained in the 2.0 release from the 1.0 version:

- Improves the reliability of high-speed modems and similar devices.
- Improves the accuracy of the system's clock.
- Corrects problems ejecting floppy disks when the computer is shut down.
- Corrects sound input problems on the Macintosh Color Classic.
- Corrects problems users may have with SCSI devices.
- Updates the Memory Control Panel to version 7.1.1, which improves performance in certain low memory conditions.

PowerBook Duo 250 and 270c: Displays (10/93)

Revised: 7/8/94
Security: Everyone

PowerBook Duo 250 and 270c: Displays (10/93)

==========

Article Created: 21 October 1993

TOPIC -----

This article discussed the displays used in the PowerBook Duo 250 and 270c.

DISCUSSION -----

The PowerBook Duo 250 has an active-matrix display which has 16 grayscales, while the PowerBook Duo 270c has a color active-matrix display with 256 colors at 640 by 480 pixel resolution and thousands of colors at 640 by 400 pixel resolution.

The PowerBook Duo 270c defaults to the 640 by 480 pixel, 256 color mode. By making a selection under Options in the Monitor control panel, then restarting, the Duo 270c can be switched to show 640 by 400 pixels in thousands of colors. When in this mode, a black band will appear at the top and the bottom of the screen.

Since contrast adjustment produces little effect on a color active-matrix display, the Duo 270c does not have a contrast control, while the Duo 250 does.

PowerBook Duo 250 and 270c: Differences (3/95)

==========

Article Created: 21 October 1993
Article Reviewed/Updated: 22 March 1995

TOPIC ----------

This article outlines the differences between the PowerBook Duo 250 and 270c.

DISCUSSION ----------

Here are the differences between the PowerBook Duo 250 and 270c. The PowerBook Duo 230 has been included for illustrative purposes.

	Duo 250	Duo 270c	Duo 230
CPU	68030 @ 33MHz	68030 @ 33MHz	68030 @ 33MHz
FPU	no	yes	no
Display	9" grayscale active-matrix	8.4" color active-matrix	9" grayscale FSTN (Supertwist)
Colors/Grays Supported	16 grayscales	thousands of colors @ 640 x 400 256 colors @ 640 x 480	16 grayscales
RAM Capacity	4 to 24MB	4 to 32MB	4 to 24MB
Hard Drive Size	200MB	240MB	80/120MB
Battery Type	Type II NiMh	Type II NiMh	Type I NiMh (Type II compatible with software)

Battery Life	2.5 to 6 hrs (Type II)	2 to 4 hrs (Type II)	2 to 4.5 hrs (Type I)
Battery Reconditioning	no	yes	no
Weight	4.2 lbs	4.8 lbs	4.2 lbs
Sleep LED	no	yes	no
Duo Dock Compatibility	yes	no, needs Top Cover Retrofit (Order # M1814Z/A)	yes

Article Change History:
22 Mar 1995 - Corrected wording of Duo Dock.

PowerBook Duo 270c and 280c: Sleep Indicator (2/95)

Revised: 2/2/95
Security: Everyone

PowerBook Duo 270c and 280c: Sleep Indicator (2/95)

==========

Article Created: 21 October 1993
Article Reviewed/Updated: 02 February 1995

TOPIC ----------

This article discusses the sleep indicator of the PowerBook Duo 270c and Duo 280c.

DISCUSSION ----------

The PowerBook Duo 270c and 280c has a light-emitting diode (LED) in the upper-right side of its display to indicate whether the unit is in sleep mode. This LED, called the sleep indicator, flashes when the Duo computer is asleep. The sleep indicator is visible whether the display is open or closed.

Article Change History:
02 Feb 1995 - Changed access privileges of article.
11 May 1994 - Updated to include PowerBook Duo 280c.

PowerBook Duo Battery Recharger: Compatibility (8/95)

Revised: 8/29/95
Security: Everyone

PowerBook Duo Battery Recharger: Compatibility (8/95)

==========

Article Created: 21 October 1993
Article Reviewed/Updated: 29 August 1995

TOPIC ----------

Is the PowerBook Duo Battery Recharger compatible with Type I and Type II batteries?

DISCUSSION ----------

The original PowerBook Duo Battery Recharger (M4178LL/A) is only compatible with Type I PowerBook Duo batteries and will not charge the high-capacity Type II PowerBook Duo batteries.

The revised PowerBook Duo Battery Recharger (M4178LL/B) is compatible with both Type I, Type II, and Type III Duo batteries.

To achieve full compatibility with Type III batteries, you must update the firmware in the charger. If you have a recharger model M1812 and you need to update it, follow these steps:

Step 1
Shut down the PowerBook Duo computer, make sure the Type III battery and any necessary software has been installed. If you are running System 7.5.1 the Type III Battery extension must be installed.

Step 2
Plug the power adapter into an AC outlet using the power cord that came with the computer.

Step 3
Snap the recharger onto the side of the power adapter.

Step 4
Plug the power adapter cable into the power adapter port on the back of the Duo computer.

Step 5
Turn on the PowerBook Duo to download the update to the charger.

Article Change History:
29 Aug 1995 - Added information about the Type III Battery extension.
03 Apr 1995 - Added steps to update older chargers.

PowerBook 200 & 2300 Series: Duo Dock Compatibility (1/96)

Revised: 1/11/96
Security: Everyone

PowerBook 200 & 2300 Series: Duo Dock Compatibility (1/96)

==========

Article Created: 21 October 1993
Article Reviewed/Updated: 11 January 1996

TOPIC ----------

The following chart provides the compatibility of PowerBook Duo systems with the PowerBook Duo Dock, Duo Dock II, and Duo Dock Plus.

DISCUSSION ----------

Begin_Table

Duo Computer	Compatible with Duo Dock	Compatible with Duo Dock II	Compatible with Duo Dock Plus	Compatible with Duo MiniDock
PowerBook Duo 210	Yes	Yes	Yes	Yes
PowerBook Duo 230	Yes	Yes	Yes	Yes
PowerBook Duo 250	Yes	Yes	Yes	Yes
PowerBook Duo 270c	Yes, 1	Yes	Yes	Yes
PowerBook Duo 280	Yes, 2	Yes, 2	Yes	Yes
PowerBook Duo 280c	Yes, 1,2	Yes, 2	Yes	Yes
PowerBook Duo 2300c	Yes, 1,2	Yes, 2	Yes	Yes

End_Table

1- This system is slightly thicker than other PowerBook Duo computers and will not physically fit into the original Duo Dock. The PowerBook Duo Top Cover Upgrade (p/n M1814Z/A) is an enlarged top cover which will allow the Duo Dock to accommodate all of PowerBook Duo computers. An upgraded Duo Dock will also support a monitor of up to 85 pounds such as an Apple 21" Color Display. Without retrofitting, the Duo Dock will support a monitor of up to 35 pounds, such as an Apple 14" Color Display.

2- This system cannot utilize the 68882 math coprocessor (FPU) if installed in the Duo Dock.

Article Change History:
11 Jan 1996 - Corrected minor typo.
03 Oct 1995 - Updated with information for 2300c, Duo Dock Plus and MiniDock.
03 Apr 1995 - Updated compatibility info for 280/280c and Duo Dock II.

System 7 Pro: Read Me Incorrect About Apple IIe Card SW (10/93)

==========

Article Created: 20 October 1993

TOPIC -----

The information about how to obtain Apple IIe Card Software in the Read Me file for System 7 Pro is incorrect. This article explains the best ways to obtain this software.

DISCUSSION -----

The Read Me file that is installed when updating to System 7 Pro reads as follows:

"APPLE IIe CARD SOFTWARE FOR THE MACINTOSH LC II

To use the Apple IIe Card with System 7 Pro on a Macintosh LC II, you need version 2.2 of Apple IIe Card Software. You should upgrade to version 2.2 only if you are using your LC II with System 7 Pro. Apple IIe Card Software 2.2 may also be used with the original Macintosh LC, but it is not required.

You can obtain the upgrade package from an authorized Apple Reseller. In the United States, you can call the Apple Customer Assistance Center at 1-800-776-2333 to request Apple IIe Card Software version 2.2. The new software is also available on AppleLink (AppleLink path: Apple Products: Apple II: Apple II Product Information: Apple IIe Card)."

These instructions aren't correct.

Contact an Apple Reseller to purchase the IIe software update, or download it from AppleLink. You can all the Apple Referral Center at 1-800-538-9696 to locate a reseller near you to purchase Apple part M1222LL/C, Apple IIe card Software Update.

Apple IIe Card (2.2.1) software is available for customers on AppleLink using the following path:

Software Sampler
Apple SW Updates
Macintosh
Peripheral Software
Apple IIe Card (2.2.1)

At Ease: Stuffit Deluxe 3.0.7 Corrects Incompatibility (3/94)

Revised: 3/7/94
Security: Everyone

At Ease: Stuffit Deluxe 3.0.7 Corrects Incompatibility (3/94)

==========

Article Created: 18 October 1993
Article Reviewed/Updated: 7 March 1994

TOPIC ----------

There are a couple of incompatibilities between At Ease for Workgroups 2.0 and Aladdin's StuffIt Deluxe 3.0 with SpaceSaver(SpaceSaver is compression software that stores unused applications and documents in a compressed state. But when the application or document icon is double-clicked, it launches as if it weren't compressed):

- With SpaceSaver software installed, At Ease can't see any applications at all (probably because they are compressed). The Finder can launch these compressed applications without any trouble.

- Magic Menu doesn't appear in the menu when the Finder is available. (Magic Menu is a custom menu that supplies immediate menu access to StuffIt Deluxe features from the Finder.)

DISCUSSION ----------

The work around for the first issue would be to use the 'find item' option in At Ease and to add the compressed application to the setup. There is no other solution.

Aladdin Systems reports they have corrected the second problem with the 3.0.7 version of StuffIt Deluxe (includes StuffIt SpaceSaver 3.0.6). The free update is available on most on-line systems, including Aladdin's bulletin board on AppleLink.

Please contact Aladdin Systems directly if you have any questions. To locate a vendor's address and phone numbers, use the vendor name as a search string.

Article Change History:
7 March 1994 - Corrected misinformation about both bugs being addressed.

Macintosh TV: Description (10/93)

Revised: 11/8/93
Security: Everyone

Macintosh TV: Description (10/93)

==========

Article Created: 25 October 1993

TOPIC ----------

This article describes the Macintosh TV product. At introduction, Macintosh TV is available in limited distribution and only in the U.S. It is sold through a limited number of consumer electronics and higher-education retailers, and through the Apple Catalog.

DISCUSSION ----------

Macintosh TV is a Macintosh computer -- and it's a television receiver and CD player. In one unit, it combines all of these capabilities:

- An affordable Macintosh computer
- Cable-ready 14-inch color TV with remote control
- Video-input port to connect VCR, camcorder, or video game player
- Stereo CD player with remote control
- Stereo speakers

Macintosh TV can be used to view and capture frames from broadcast television and video sources. It can function as a video game platform. It can be used as a CD player with enhanced stereo sound. Interaction with the system is not limited to the keyboard and mouse: Macintosh TV comes equipped with an infrared remote that controls both the TV and CD player.

Macintosh TV: Specifications (11/93)

==========

Article Created: 25 October 1993
Article Revised/Updated: 30 Novmeber 1993

TOPIC ----------

This article gives technical specifications for the Macintosh TV. The keyboard and mouse are included with the system.

Notes: at introduction, Macintosh TV is:
- the only computer from Apple with a matte-black case.
- available only in the U.S. There is no PAL or SECAM version for other countries.

DISCUSSION ----------

Microprocessor

- MC68030, 32 MHz clock doubled, 32-bit data bus
- Integrated PMMU (memory-management unit)

Memory

- 5MB RAM standard
- RAM expandable (by authorized Apple dealer) to 8MB with 72-pin fast-paged 80ns SIMMs
- 1MB ROM

Disk Drives

- One built-in Apple SuperDrive 1.4MB floppy disk drive
- One internal 160MB SCSI hard disk drive
- Internal AppleCD 300i double-speed CD-ROM drive for CD-ROMs, audio CDs, and Kodak Photo CDs

Television Tuner

- NTSC tuner
- 181 channels
- Cable-ready
- RCA-type video abd sound input for VCR, camcorder, laser disc, or game player
- Coaxial port for television antenna or cable service
- TV Setup control panel allows the user to listen to TV or video sound (but not the video) while using the Macintosh TV as a computer.

Video Display

- Integrated Macintosh Color Display with 14-inch Trinitron CRT
- Resolution: 640 x 480 pixels (640 x 240 for television mode with 16-bit color), 69 dpi, .26mm dot pitch
- 512K VRAM supports 256 colors (8-bit color)

Interfaces

- SCSI interface for connecting up to six external peripheral devices
- Two serial (RS-232/RS-422) ports
- One stereo sound-output port for external audio amplifier or headphones
- Two Apple Desktop Bus (ADB) ports for keyboard, mouse, and other devices
- Front headphone jack for sound output
- Hand-held remote-control unit for CD and TV

Sound Generator

- Stereo 8-bit digital-analog conversion using 22-kHz sample rate - capable of driving stereo headphones or other stereo equipment through the sound jack and headphone jack
- Built-in stereo speakers

Clock/Calendar

- Custom integrated circuit with long-life lithium battery

Software

- Macintosh System software 7.1, including HyperCard Player, MacBasics, MacCheck, and QuickTime. System Enabler 404.
- A variety of educational and productivity titles installed on hard drive
- A selection of CD-ROM titles
- CloseView, Easy Access, and visible-beep for disability access.
- TV software supports frame capture, closed captions, channel scanning, and password protection

Power Requirements

- Line voltage: 90 to 264 V AC, RMS single phase, automatically configured
- Frequency: 47 to 63 Hz
- Power: 40 W maximum, not including display

60 W maximum, including display
• Energy-saving feature reduces power consumption by 50%
• One AC outlet powers computer, display, drives, and speakers

ADB Power Requirements

• Maximum current draw for all ADB devices: 500 mA (three ADB devices maximum is recommended)
• Mouse draws 10 mA
• Keyboard draws 25 mA

Size and Weight

Main unit:
• Height: 17.5 in. (44.5 cm)
• Width: 13.5 in. (34.4 cm)
• Depth: 16.5 in. (42.0 cm)
• Weight: 41.5 lbs (18.9 kg)

Keyboard:
• Height: 1.3 in. (3.3 cm)
• Width: 16.0 in. (40.6 cm)
• Depth: 5.9 in. (15.0 cm)
• Weight: 1.96 lbs (0.89 kg)

Mouse:
• Height: 1.3 in. (3.3 cm)
• Width: 2.4 in. (6.2 cm)
• Depth: 4.2 in. (10.7 cm)
• Weight: 4.0 oz. (0.10 kg)

Operating Environment

• Operating temperature: 50 to 104° F (10 to 40° C)
• Storage temperature: –40 to 116.6° F (-40 to 47° C)
• Relative humidity: 20% to 85% noncondensing
• Maximum altitude: 15,000 ft. (4,722 m)

Article Change History:
23 November 1993 - Added "16 bit color" to resolution information for TV mode; added "System Enabler 404"
30 November 1993 - Deleted incorrect sound-input information.

Macintosh TV: Upgrading RAM to 8MB (10/93)

Revised: 10/20/93
Security: Everyone

Macintosh TV: Upgrading RAM to 8MB (10/93)

==========

Article Created: 18 October 1993

TOPIC ----------

This article describes how to upgrade the RAM in a Macintosh TV from 5MB to 8MB. This procedure should be performed only by an Apple-authorized service provider.

DISCUSSION ----------

To upgrade the RAM in Macintosh TV:

1) Remove the 1MB SIMM.

2) Install a Centris 610/650 4MB DRAM expansion kit, bringing the Macintosh TV's memory to 8MB.

   DRAM Expansion Kit: M1507LL/A 4MB expansion kit

Macintosh LC 475 & Quadra 605: LC-PDS Slot Q&A (10/93)

Revised: 10/20/93
Security: Everyone

Macintosh LC 475 & Quadra 605: LC-PDS Slot Q&A (10/93)

==========

Article Created: 21 October 1993

TOPIC ----------

This article answers basic questions about the LC-PDS slot in the Macintosh LC 475 and Quadra 605 computers.

DISCUSSION ----------

Q) Why isn't the Macintosh LC 475 PDS slot an 040 PDS slot?

A) Because of the popularity of the Macintosh LC computers, many third-party developers have created expansion cards based on the LC-PDS. Like the other members of the Macintosh LC series the LC 475 can take advantage of many of the LC cards on the market, such as the video-out, Ethernet, and Apple IIe cards. Compatibility among the Macintosh LC 475, LC, LC II, and LC III slots means that a customer can simply take most cards out of an LC II slot, and place it in an LC 475 slot.

Q) What cards do, and do not, work with the "LC-PDS compatible" slot?

A) The expansion slot is an LC III compatible expansion connector, and almost all cards that work with Macintosh LC III also work with the LC 475. Examples include video-out, Ethernet, and Apple IIe cards. Cards that are 030-specific, such as 030 accelerators or 030 cache cards, do not work with the LC 475 because they require direct access to the 68030 microprocessor. However, those cards are intended to speed the 68030 microprocessor to higher performance levels, which are already attainable with the 68040 microprocessor.

Q) Why isn't the Quadra 605 slot NuBus or 040 PDS?

A) Apple uses the same logic board in three product families: Performa, LC, and Quadra. It was necessary to select one standard type of expansion slot. Because the LC-PDS has been extremely successful with

both education and business customers -- through the LC, LC II, LC III, and LC 520 -- the LC-PDS technology was adopted.

Macintosh AV Systems: Powerkey Conflict (12/93)

Revised: 12/7/93
Security: Everyone

Macintosh AV Systems: Powerkey Conflict (12/93)

==========

Article Created: 20 October 1993
Article Reviewed/Updated: 7 December 1993

TOPIC -----

I have a Macintosh AV computer, and a PowerKey. I frequently get the message "Are you sure you want to shut down?" when selecting menu items. Zapping PRAM and booting with extensions off has no effect. The problem goes away when the PowerKey hardware is removed.

DISCUSSION -----

This is a problem with older versions of the PowerKey. Contact the vendor, Sophisticated Circuits, Inc., for a solution.

To locate a vendor's address and phone numbers, use the vendor's name as a search string.

Article Change History:
12/7/93 - Deleted specific reference to a new control panel, which is not the solution.

Macintosh Basics: Out Of Memory Message (10/93)

Revised: 10/20/93
Security: Everyone

Macintosh Basics: Out Of Memory Message (10/93)

==========

Article Created: 20 October 1993

TOPIC ----------

I'm trying to run Macintosh Basics, and I get a message that I'm out of memory. My Mac seems to have plenty of RAM available. Why won't it work?

DISCUSSION ----------

First try increasing the memory allocation in the Get Information box to 2500K - 5500K. If that doesn't work, or if that much RAM isn't available, make sure the Monitors Control Panel is set to 8-bit (256 Colors) or less.

660AV and 840AV: Remote Launch Crashes (11/93)

Revised: 11/23/93
Security: Everyone

660AV and 840AV: Remote Launch Crashes (11/93)

==========

Article Created: 21 October 1993
Article Review/Update: 23 November 1993

TOPIC ----------

I'm having trouble launching applications from a remote server with the 660AV and 840AV computers. In both cases, the computers crash, sometimes with a Bus Error, other times with a freeze, or Errors of Type 1, 2, and 3 when launching applications.

The 660AV is connected via LocalTalk and the 840AV is connected via TokenTalk to a Novell Server.

In both cases, setting the Cache Control Panel to More Compatible enabled the machines to operate properly.

Is there an incompatibility of this sort when launching applications or files on an AV computer from a remote volume?

DISCUSSION ----------

Apple Support tested with a Centris 660AV and a Quadra 840AV and verified that some applications will crash or hang these computers when launched remotely with LocalTalk.

Launch of the application locally, or turn the cache OFF as a workaround for this problem.

The Novell situation is the same in that it is a remote launch of an application, and the same workarounds will work for it.

Ofoto Version 2 Update 2.0.2 for Apple Scanners (10/93)

Revised: 10/21/93
Security: Everyone

Ofoto Version 2 Update 2.0.2 for Apple Scanners (10/93)

==========

Article Created: 21 October 1993

TOPIC ----------

This article explains how to obtain Ofoto version 2, update 2.0.2.

DISCUSSION ----------

This update has been mailed to everyone who bought the Ofoto Version 2 upgrade for Apple scanners directly from Light Source. In addition, the update will be sent to new Apple scanner owners who register Ofoto before October 31, 1993. If you have Ofoto release 2.0 and an Apple scanner, and you would like the revision, please mail in your registration card before October 31, 1993, and it will be sent to you automatically.

After October 31st, call Light Source at 800-231-7226 to order the update for an $8 shipping charge. Outside the United States and Canada, call Light Source in Scotland at 44-506-462-444 (shipping is $25). Be sure to have your Ofoto disks handy.

Please note that Light Source Technical Support now has its own AppleLink address: LS.SUPPORT

Apple Color Plus 14 Display: Description (12/93)

Revised: 1/4/94
Security: Everyone

Apple Color Plus 14" Display: Description (12/93)

==========

Article Created: 15 December 1993
Article Reviewed/Updated: 4 January 1994

TOPIC ----------

This article describes the Apple Color Plus 14" Display.

DISCUSSION ----------

The Apple Color Plus 14" Display is Apple's most affordable RGB color monitor. It features high-quality resolution, ergonomic design, ease of use, and compatibility with all of the modular Macintosh computers, as well as with most PowerBook models.

With its 640 by 480 pixel resolution and 0.28-millimeter dot pitch, the Apple Color Plus 14" Display offers the image quality you need to get your work done, whether you're a home user, a student, or a professional working with text, images, or both. The RGB design delivers colors that are crisp, sharp, and clear, while the 67-hertz screen re-fresh rate provides flicker-free viewing. And the tilt-and-swivel base allows you to adjust your Apple Color Plus 14" Display to just the right angle.

The Apple Color Plus 14" Display is optimized for the modular Macintosh systems—the Macintosh LC computers, the Macintosh Centris line, and the Macintosh Quadra family—and also works with most Apple PowerBook models. It attaches directly to your computer's monitor port, offering plug-and-play simplicity. And it's easy to use, with conveniently located, front-panel on/off, brightness, and contrast controls.

As the most economical member of the Macintosh Color Display family, the Apple Color Plus 14" Display provides an alternative to the Macintosh Color Display, Apple's highest performance 14-inch, half-page RGB display with 0.26-millimeter dot pitch that offers superior clarity. The flat, high-contrast screen of the Macintosh

..TIL13764-Apple_Color_Plus_14_Display-Description_12-93.pdf

Color Display delivers crystal-clear resolution over the entire screen area—for even the most finely detailed images. In short, the Apple Color Plus 14" Display is ideally suited for value-conscious users who want RGB performance and Apple quality at the most affordable price. And the Macintosh Color Display is the perfect choice for those who require even sharper color and exceptional resolution.

Features

High display quality

- Provides 640- by 480-pixel resolution
- Features a dot pitch of 0.28 millimeters
- Uses shadow-mask technology

Ergonomic design

- Comes with a tilt-and-swivel base that allows you to adjust the viewing angle
- Features a 67-hertz screen refresh rate for flicker-free performance
- Meets requirements for low-frequency (ELF and VLF) magnetic and electric emissions

Ease of use

- Provides "plug-and-play" simplicity with any modular Macintosh computer, as well as with most PowerBook models
- Offers easy access to brightness, contrast, and on/off controls

Safety

- Meets or exceeds the Swedish MMPR II standard.

Article Change History:
4 January 1994 - Added Swedish MMPR information

Macintosh TV: Expansion & Upgrade Q & A (10/93)

Revised: 10/21/93
Security: Everyone

Macintosh TV: Expansion & Upgrade Q & A (10/93)

==========

Article Created: 25 October 1993

TOPIC ----------

This article answers several questions about the expansion and upgrade possibilities of the Macintosh TV.

DISCUSSION ----------

Q) What is the computing performance of Macintosh TV?

A) Macintosh TV is targeted at new users and provides entry-level performance similar to that of the Performa 600, or about 15% less than a Macintosh LC 520. Although the Macintosh TV's case is similar to the LC 520's, the internal architecture is the same as the Performa 600 and Macintosh IIvx.

Q) Why is the performance of Macintosh TV less than the Macintosh LC 520, even though the clock speed of the processor is faster?

A) As with the Performa 600 and Macintosh IIvx, the bus on the logic board operates at half the speed of the processor. On the Macintosh LC 520 and LC III, the bus operates at the same clock speed as the processor.

Q) Can I upgrade a Macintosh LC 520 to a Macintosh TV?

A) There is no upgrade from Macintosh LC 520 to Macintosh TV.

Q) How can I expand the RAM in a Macintosh TV?

A) To expand RAM to the maximum 8MB, have an authorized service provider replace the 1MB SIMM with a 4MB SIMM. The SIMM must be a 72-pin design

that also works in the LC III.

Q) Does Macintosh TV have a PDS slot?

A) The television tuner in Macintosh TV is on a card in a special PDS-like slot on the logic board. There is no other slot for expansion cards. The tuner card can neither be installed in the PDS slot in other Macintosh models, not can other PDS cards be installed into Macintosh TV.

Macintosh TV: Controls (10/93)

Revised: 10/28/93
Security: Everyone

Macintosh TV: Controls (10/93)

==========

Article Created: 25 October 1993

TOPIC ----------

This article answers several questions about the Macintosh TV's controls and its remote control.

DISCUSSION ----------

Q) Can the TV tuner work without the computer being on?

A) No. The computer and television share the same power source and video circuitry. You must turn on the computer to access the TV features. (You can use the remote control to turn the computer on.)

Q) What does the remote control do?

A) You can use the remote control to:
Change television stations
Control volume and mute sound
Shut down or restart the computer
Switch between computer and television mode
Play, pause, fast forward, rewind, or eject an audio CD

Q) Will other remote controls work if I lose my remote control?

A) Yes, a standard replacement remote control, available from consumer electronic stores, can be used to control a Macintosh TV. Any remote that can control a Sony television can work with Macintosh TV.

Q) What software controls the television receiver in Macintosh TV?

A) The TV Setup Control Panel is used to:
Automatically enable channels that have valid signal strength

Turn on closed caption capabilities
Configure a "hot key" to switch to and from TV mode
Set a password for switching to TV mode
Play sound from television or video source in computer mode

Ignore this line (added to this article as a test) Macintosh Television

Macintosh TV: Video Q & A (10/93)

Revised: 10/21/93
Security: Everyone

Macintosh TV: Video Q & A (10/93)

==========

Article Created: 25 October 1993

TOPIC ----------

This article answers several questions about the video capabilities of the Macintosh TV.

DISCUSSION ----------

Q) Is Macintosh TV considered an AV system?

A) Although Macintosh TV includes video-in capabilities, it lacks some AV features, such as speech recognition and GeoPort.

Q) How is Macintosh TV's video different from the video in the Macintosh AV products?

A) The Macintosh Quadra 660AV and Quadra 840AV can display video input in a resizeable window on the display. You can see this window while you work with other applications. Macintosh TV's video, on the other hand, takes up the entire display. Although applications can be running in the computer mode while you view video, you can see only the computer or only the video mode at one time.

Q) Do I need a VCR or cable service to watch TV on Macintosh TV?

A) No. Macintosh TV includes a cable-ready tuner, along with video input ports. Just connect an antenna to watch TV.

Q) What is the quality of video on Macintosh TV?

A) Macintosh TV has the same video-display quality as the Quadra 660AV, at the same resolution (640 x 480). At a viewing distance close to the

display, video images may look slightly "pixelated" due to displaying the video at a resolution of 640 x 240 at 16 bits per pixel. Displaying half the lines at twice the bit-depth is called "line doubling." From a normal television viewing distance, the quality is quite good.

Q) Can I capture a video image to use in applications? What about QuickTime movies?

A) To capture a screen image, use the Command-Shift-3 key combination. The resulting image can be viewed by TeachText and pasted into any application that supports PICT. Macintosh TV does not support recording of QuickTime video movies.

Macintosh TV, LC/Performa 550, LC 520: How They Differ (4/95)

Revised: 4/20/95
Security: Everyone

Macintosh TV, LC/Performa 550, LC 520: How They Differ (4/95)

==========

Article Created: 25 October 1993
Article Reviewed/Updated: 20 April 1995

TOPIC ----------

This article provides a quick-reference table of differences among three similar Macintosh models: Macintosh LC 520, Macintosh LC/Performa 550, and Macintosh TV.

These three products share an all-in-one design with 14-inch Trinitron display.

DISCUSSION ----------

	LC/Performa 550	LC 520	Macintosh TV
Market	Home	Education	Home & Education
Case color	platinum	platinum	matte black
Clock speed	33 MHz	25 MHz	32 MHz (clock doubled)
FPU Socket	yes	yes	no
Standard RAM	5MB	4MB	5MB
Maximum RAM	36MB	36MB	8MB
VRAM	512K or 1 MB	512K or 768K	512K
Bit depth-Max.	16-bit	16-bit	8-bit
Display colors	32,000	32,000	256
Hard Drive	160MB	80MB or 160MB	160MB
AppleCD 300i	standard	optional	standard
Expansion slot	one	one	none
TV tuner	no	no	yes

Microphone	yes	yes	no
Sound	stereo in & out	mono in, stereo out	mono in, stereo out
Remote control	no	no	yes
Keyboard	included	sold separately	included

Article Change History:
20 Apr 1995 - Corrected Macintosh LC/Performa 550 VRAM configurations.
25 Oct 1993 - Expanded scope of article to include Macintosh TV.

PageMaker 5.0: Faxing From Within the Application (7/94)

Revised: 7/21/94
Security: Everyone

PageMaker 5.0: Faxing From Within the Application (7/94)

==========

Article Reviewed/Updated: 21 July 1994
Article Created: 10 October 1993

TOPIC ----------

I cannot fax from PageMaker 5.0 with Express Modem Fax Sender software. The following symptoms occur whether I'm using Fax Sender software on a GeoPort Telecom Adapter, an Express Modem on a 68K or Power Macintosh system, or on an Express Modem in a PowerBook.

Symptoms:
When I use the fax shortcut (pressing Control and Shift keys while selecting Fax from the File Menu), the following message appears:

"Cannot build printer list. No valid PPD files were found.
Check the 'Printer Descriptions' folder in the System Folder. Continue."

If I select 'Fax Sender' in the Chooser, then try to Fax from the File Menu, the print dialog box appears and hangs when I press the Print button.

If I hold down the option key while selecting Print from the File Menu, the machine hangs.

DISCUSSION ----------

Use this workaround when faxing documents from PageMaker 5.0 using Fax Sender software:

1) Use the Fax Sender as you would with any other application. Open the Chooser and select 'Fax Sender'
2) Select 'Fax' from the File Menu and press the 'Setup' button in the print dialog box.
3) The 'Fax Sender Page Setup' dialog box now appears. Make any changes necessary. Press 'OK'
4) The 'Fax Sender' dialog box now appears. Type in the fax receiver's phone number or choose one from the address book.

5) Press 'Send' to transmit the document.

Video Mirroring and PowerLink Presentor Issue (10/93)

Revised: 10/25/93
Security: Everyone

Video Mirroring and PowerLink Presentor Issue (10/93)

==========

Article Created: 20 October 1993

TOPIC -----

When I purchased E-Machines' PowerLink Presentor there was a Release Note document giving me the latest information not covered in the Owner's Guide. Under Video Mirroring, it stated: "Some user's report problems with Apple's video mirroring feature with Presentor. The problem is caused by a bug in Apple's PowerBook Display control panel software. We recommend that you do not use this feature until you receive updated software from Apple."

Is this a known bug and is Apple sending out new software?

DISCUSSION -----

It is reported that E-Machines', a division of SuperMac Technology, latest software release of PowerLink Presentor version 1.0.2 solves this problem. We downloaded it from their BBS at 408-541-6190. You can also look on AmericaOnline and CompuServe.

To locate a E-Machines' address and phone number, use SuperMac Technology as a search string.

Disk Doubler 3.7.7i: System 7 Pro (10/93)

Revised: 10/22/93
Security: Everyone

Disk Doubler 3.7.7i: System 7 Pro (10/93)

==========

Article Created: 22 October 1993

TOPIC --

DiskDoubler version 3.7.7.i comes bundled on Apple external hard drives. Fifth Generation System's DiskDoubler v 3.7.7i compresses files, saving storage space. This article describes a problem with DiskDoubler 3.7.7i and System 7 Pro.

DISCUSSION --

The only known problem occurs during installation in 24-bit Memory mode. If you restart your computer with the DiskDoubler INIT loading before the new Finder creates its Preferences file, your system will crash. The solution is to start up without extensions, letting the Finder create the preferences file, and then restart so your extensions load.

AppleDesign Powered Speakers: Sound Cuts Out (4/94)

Revised: 7/15/94
Security: Everyone

AppleDesign Powered Speakers: Sound Cuts Out (4/94)

==========

Article Created: 25 October 1993
Article Reviewed/Updated: 15 July 1994

TOPIC ----------

I am using the AppleDesign Powered Speakers with a Macintosh computer. On some CD audio tracks, where there are very soft passages, the sound will cut out. Other third party powered speakers do not cut out like this. I exchanged the speakers and the second set does the same thing.

DISCUSSION ----------

There is noise gate circuitry internal to the AppleDesign Powered Speakers that reduces the noise level of the output of the speakers. This noise gate is in place to reduce the amount of noise heard through the speakers while the speakers are just amplifying the sounds from the CPU, such as alert beeps. This noise gate turns off the sound to the speakers when the input level (at the CPU input jack, located on the AppleDesign Powered Speakers) falls below a set voltage level. This circuitry is only connected to the 1/8" stereo jack (CPU Input Jack) and not to the dual phono plugs (CD Stereo Cable Jacks).

The noise level from other sources such as CD players, televisions and compact cassette players should be low enough that the noise gate would not be necessary on the CD Stereo Jack inputs.

Replacement Cable

Using a Y adapter cable from the computer's sound out port to the CD Stereo Cable/RCA Jacks on the speakers will eliminate the sound drop outs, but you will lose out on the noise limiting feature of the noise gate.

You can get a Y adapter cable at Radio Shack and similar electronics stores. As of 7/15/94, the Radio Shack Catalog part numbers for the replacement cables were as follows:
3 ft cable.....42-2475
6 ft cable.....42-2481

Please contact Radio Shack for further information.

Turn Up the Volume

The best way to handle this situation without having to buy any new cables is to turn up the volume in the Sound control panel and use the volume knob on the speakers to control the speakers volume. If you do this the problem of sound drop outs will be eliminated.

The problem occurs on all Power Macintosh computers and Macintosh computers. The sound drops occur in both application programs and when playing audio CD's.

This article provides information about a non-Apple product. Apple Computer, Inc. is not responsible for the content pertaining to that product. Please contact the vendor for additional information.

Article Change History:
15 Jul 1994 - Added Radio Shack part number information.
19 April 1994 - Added Power Macintosh computers to list of computers.

Apple Workgroup Server 60 Changes (10/93)

Revised: 10/25/93
Security: Everyone

Apple Workgroup Server 60 Changes (10/93)

==========

Article Created: 21 October 1993

TOPIC ----------

This article describes the changes in the Apple Workgroup Server (AWS) 60 with it's October 1993 product release.

DISCUSSION ----------

The October 1993 release of the AWS 60 provides a faster CPU from 20 MHz to 25 MHz. You will see AppleShare 4.0 performance similar to the 20MHz system, however, CPU intensive applications running on the server will be faster. (The benchmark for how much faster will be dependent on those applications.)

Below is a table showing the differences between the two:

	Discontinued AWS 60	AWS 60
CPU:	20 MHz 68040	25 MHz 68040, with FPU
Name:	Apple Workgroup Server 60	Apple Workgroup Server 60
Part Number:	M1780xx/A M1781xx/A M1911Z/A	M1780xx/B M1781xx/B M1911Z/B
Software:	AppleShare 4.0 System 7.1	AppleShare 4.0 System 7.1

Documentation will NOT change. We will add a sticker to the front of the manual notifying customers that the speed has been improved which will differ from their documentation.

Performa: Shut Down Desk Accessory (10/93)

Revised: 10/25/93
Security: Everyone

Performa: Shut Down Desk Accessory (10/93)

==========

Article Created: 25 October 1993

TOPIC -----

My Macintosh Performa has a desk accessory called Shut Down in its Apple menu.

What does it do?

DISCUSSION -----

The ShutDown DA allows you to properly shutdown your Performa from any application which supports the Apple Menu. You simply open the DA and select Shut Down, instead of switching out of your current application to the Finder, then selecting Shut Down from the Special menu.

The Shut Down DA doesn't disable the normal shutdown method; you can still switch to the Finder and select Shut Down from the Special menu.

PlainTalk: Installation and Plaintalk Disk 5 (10/93)

Revised: 10/25/93
Security: Everyone

PlainTalk: Installation and Plaintalk Disk 5 (10/93)

==========

Article Created: 25 October 1993

TOPIC ----------

When I try to install the PlainTalk software on my Centris/Quadra 660AV or Quadra 840AV, the Installer asks for either the PlainTalk Disk 5 or the Introduction to Speech disk. Neither of these disks were included with the computer.

How do I install PlainTalk?

DISCUSSION ----------

The Installer will ask for the PlainTalk Disk 5 or the Introduction to Speech disk if you try to install PlainTalk from the PlainTalk diskettes.

You must install PlainTalk from the System Software diskettes that came with your AV computer. Do NOT attempt to install PlainTalk from the PlainTalk diskettes.

To install PlainTalk, you must perform a custom System Software install. To do this, follow these steps:

1) Boot your Macintosh with the Install Me First diskette.

2) Select a custom installation.

3) Select PlainTalk only, then click Install. Swap diskettes as directed by the software.

This will install all the necessary PlainTalk files without asking for the nonexistent disks.

Newton MessagePad: Be Careful When Pressing Reset Switch (10/93)

Revised: 10/25/93
Security: Everyone

Newton MessagePad: Be Careful When Pressing Reset Switch (10/93)

==========

Article Created: 25 October 1993

TOPIC -----

What happens if I press my Newton MessagePad's reset too hard?

DISCUSSION -----

If you press the reset switch too hard, you may damage your MessagePad. Since the Newton MessagePad's reset switch produces no audible or physical response (like a 'click') when you press it, some users may expect some sort of response and press harder than normal.

You should use no more pressure on the reset switch than you use to write on the Newton's touchpad screen.

Flashing Question Mark on the Screen: Causes and Cures (11/95)

Revised: 11/15/95
Security: Everyone

Flashing Question Mark on the Screen: Causes and Cures (11/95)

==========

Article Created: 25 October 1993
Article Reviewed/Updated: 15 November 1995

TOPIC ----------

This article tells you what to do when you see a blinking or flashing question mark on your screen when you startup a Macintosh or Macintosh Performa computer (assuming you are using System 7.x).

The flashing question mark indicates that the computer cannot locate the valid system software. Each of the possible causes has a specific solution.

DISCUSSION ----------

Typically blinking question marks are caused by:

- Damaged or missing System Software
- SCSI configuration problems
- Third Party software conflict
- Corrupted PRAM
- Damaged Hardware

System Software Improperly Configured
==========

Sometimes a System Folder is on the hard drive, but its components are not configured properly, are damaged, or there may be two or more System Folders present. Use the steps in the following table to correct this problem:

Step 1

Restart your system using Disk Tools (if this fails, go to the next section "Attached Peripherals (SCSI Devices) Improperly Configured").

Step 2

Open the hard disk's icon.

Step 3

Open the System Folder. Ensure that the System and Finder are present and at the root level of the System Folder.

Step 4

Double-click the System file to confirm that it can open. If there is an error, perform a clean install.

Step 5

Make sure that you have only one System Folder on your hard drive. The active System Folder icon should contain a little picture of a Macintosh. If you find an extra System Folder, move it to the Trash icon and choose Empty Trash from the Special menu.

Step 6

If you are a Performa user, and have a previous back up of your system, turn on the computer and insert the Utilities Disk, run Apple Restore, and restore your System Software. If you have not had a chance to back up your system, contact the Apple Assistance Center (1-800-SOS-APPL) for further assistance.

Attached Peripherals (SCSI Devices) Improperly Configured

A chain of SCSI devices, called a SCSI bus, might include peripherals, such as external hard drives, CD-ROM drives, scanners, and printers, linked together with SCSI cables. To determine whether you have a SCSI configuration problem, complete the following steps:

Step 1

Turn off the computer.

Step 2

Turn off all attached devices.

Step 3

Completely disconnect the SCSI bus from your computer.

Step 4

Start up the computer.

If your computer starts up properly, you know the problem is with your SCSI

chain. For more information on troubleshooting SCSI problems, search on "How to Connect Macintosh SCSI Devices."

Third Party Software Conflicts

If you have recently added or modified your system by adding any additional software, you may be experiencing a software conflict. If starting from Disk Tools was successful, then try restarting without Disk Tools, and hold down the Shift key. If this is successful, then you most likely have an Extension or Control Panel problem, and you should remove any third party software from your System Folder. You can also use the Extension Manager or another third party utility to turn off Extensions or Control Panels. If you still cannot restart from the System Folder on your hard drive (but were successful when starting with Disk Tools), then a Clean Install is recommended.

Corrupted PRAM

One of the factors that causes a flashing question mark is a corrupt PRAM or logic board setting. Steps to resolve this problem include zapping PRAM by holding down the Command-Option-p-r keys at system startup. If this does not resolve the problem, you can remove the logic board battery for 10 minutes. This should only be done by an authorized service provider, since damage to the logic board is possible if not done properly.

By pulling the battery, the PRAM is completely cleared and other logic board components are reset. Causes for this corruption could be a faulty ADB device, or AudioVision displays.

Hardware Problems

If none of the preceding solves your problem, you may need to take your computer to an authorized Service Provider for repair.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). Apple Color OneScanner: LED Error Flashes Twice (10/93)

Revised: 10/26/93
Security: Everyone

Apple Color OneScanner: LED Error Flashes Twice (10/93)

==========

Article Created: 26 October 1993

TOPIC -----

Upon turning on my Apple Color OneScanner the error LED flashes twice. This indicates a lamp error, but replacement of the lamp and logic board does not repair the unit.

DISCUSSION -----

Vendor evaluation of the scanner and 20 optical assemblies determined that the optical assembly can be at fault when the two flashing LED error signal occurs.

Do the following steps:
1 Clean the glass cover assembly
2. Check the lamp holder connection, be sure the label of the florescent lamp faces down into lamp holder
3. If that doesn't solve the problem, then replace the lamp, and finally the optical assembly.

Does AppleMail Support AppleScript (1/95)

Revised: 1/19/95
Security: Everyone

Does AppleMail Support AppleScript (1/95)

==========

Article Created: 25 October 1993
Article Reviewed/Updated: 19 January 1995

TOPIC --------------------

I'm doing some testing and evaluating of Apple Mail that comes with System 7 Pro and System 7.5. I want to automate the moving of mail into different folders on the network. However, the AppleMail application as delivered by Apple is not scriptable. Is this true, and if so will it be scriptable, script aware, or recordable in the future?

DISCUSSION --------------------

There are two functional areas of scripting being discussed here. Being able to move and sort mail from the PowerTalk Mailbox which is a function of Finder scriptability, and the AppleMail application, which is a text editor with a PowerTalk mail header capability.

AppleMail is not scriptable, script aware, or recordable. AppleMail was never meant to be THE messaging application, it is a bare bones tool. AppleMail as a word processor will probably never attain the scriptability of say, Scriptable Text Editor. In other words, everyone should think of AppleMail as the TeachText of messaging.

If you need a scriptable word processor, then MacWrite Pro, WordPerfect, or Microsoft Word as well as other are all candidates. These three all support AppleScript and PowerTalk mail headers.

The Scriptable Finder can be installed into the System 7 Pro environment, but the capabilities of managing mail through AppleScript are still extremely limited. New Mailbox APIs will be made public to enable development of better managers and filters for the PowerTalk Mailbox.

Apple Installer: Right Name, But Wrong Disk Message (3/94)

Revised: 3/9/94
Security: Everyone

Apple Installer: "Right Name, But Wrong Disk" Message (3/94)

==========

Article Created: 22 October 1993
Article Reviewed/Updated: 8 March 1994

TOPIC ----------

The Apple Installer application is used for most software that Apple distributes, including System 7. Sometimes installation halts on a specific disk, and it gives an error message saying the disk "has the right name, but it is the wrong disk."

DISCUSSION ----------

Check the hard drive to be sure that there is not a folder or file with the same name as one of the disks that you are trying to install. You should check the root level of the hard drive and the desktop for items with identical names to those of the disks the installer will be using.

Inspect the disk for a file moved from its proper location or renamed. Once you move the file back to its correct location and/or properly rename it, installation should run successfully.

This will require verification of file locations using another set of the installation disks, or a file or directory description for each disk. Any installation using the Apple Installer could be an applicable situation, assuming there aren't other factors affecting the suspect disk.

For non-Apple software, you should check with the appropriate vendor. To locate a vendor's address and phone numbers, use the vendor name as a search string.

SNA•ps 5250 1.0 and OfficeVision/400 (10/93)

Revised: 10/28/93
Security: Everyone

SNA•ps 5250 1.0 and OfficeVision/400 (10/93)

==========

Article Created: 26 October 1993

TOPIC ----------

When using SNA•ps 5250 in OfficeVision/400 (OV/400), and I use the word processing feature, the attributes (underline, and bold) don't work. Also other standard word processing functions like (insert, backspace, paragraph insert, margin ajust) don't exist. The Notes window doesn't scroll. The end of line word wrap doesn't work correctly.

With TokenAccess, I don't have this problem. Is something wrong with my configuration, or do these features in OV/400 simply not work with SNA•ps 5250?

DISCUSSION ----------

To support Text Assist, the emulation must support additional structured fields in the SNA data stream. SNA•ps 5250 does not support them so it gets the Notes window in OV/400 as a straight text window. Using InterAxcess or an IBM terminal (3196), the Notes message window does scroll within the total Notes window. The SNA•ps Notes window does not word wrap correctly at the end of the line, it just divides the word into two pieces. We would assume any other "standard" OV/400 word processing features would not work either.

The reason for not including Text Assist with SNA•ps emulation is the very low use of OV/400 as a word processor, when you can use a Macintosh Word Processing Application rather than the AS/400 resources. There have been marketing discussions about adding Text Assist to the SNA•ps 5250 product but no decision has been made, and no product is available as of October 1993 with a development schedule to include it.

We have advised Macintosh customers to use InterAxcess as their 5250 emulation if Text Assist support is essential. There is no other workaround.

Revised: 10/28/93
Security: Everyone

Publish-It Easy: Use LW Driver 7.2 or 7.1.2 (10/93)

==========

Article Created: 28 October 1993

TOPIC----------

I'm having trouble printing from Publish-It Easy. I am able to print text files properly, but files with graphics and more complicated page layouts give the PostScript error "flushed by LaserWriter, no current point, offending command current point."

Are PostScript errors like this generated by the application, the driver, or the printer?

DISCUSSION ----------

Apple contacted TimeWorks, Inc. who develops Publish-It Easy and they are aware of the "no current point" PostScript errors.

Publish-It Easy is only compatible with PostScript Level I print drivers. You're most likely using LaserWriter driver 8.0 or 8.1.1. Apple recommends using LaserWriter driver 7.2 or 7.1.2 instead.

Composite Sync on Green: Which Apple Computers Have It? (9/95)

Revised: 9/13/95
Security: Everyone

Composite Sync on Green: Which Apple Computers Have It? (9/95)

==========

Article Created: 28 October 1993
Article Reviewed/Updated: 13 September 1995

TOPIC ----------

Could you provide information about which Apple computers have a Composite Sync on Green and which models do not? This function is helpful when connecting third party monitors to Macintosh computers.

DISCUSSION ----------

Sync on green refers to the practice of sending the video synchronization signal along with the green color signal. Previously released Macintosh models with built-in video have supported sync on green.

For computers without sync on green, a third party adapter is necessary if you wish to connect a third party monitor which requires sync on green.

No Sync On Green

LC III
LC 475
LC 575
LC 550
Performa 550/560/575/577/578
Performa 460/466/467
Performa 475/476
Quadra 605
Quadra 840AV
Quadra 660AV
Macintosh 630 family
All portable computers (also no blanking)
Duo Dock (also no blanking)
Duo Dock II (programmable *)
All Power Macintosh models

Sync On Green

Quadra 700 (programmable *)
Quadra 800
Quadra 900 (programmable *)
Quadra 950 (programmable *)
Centris 610
Centris 650
Quadra 610
Quadra 650

Note:
* - The programmable feature refers to the fact that the computer automatically disables the sync on green signal whenever the sense lines detect that a VGA monitor is connected.

Questions and Answers
==========

Question:
Why is Sync on Green not supported on all computers?

Answer:
1) Many users have had problems with sync on green when hooking up third- party monitors; mainly multi-frequency displays from the PC world. Since these displays are increasingly being used with Macintosh, the lack of sync on green increases the number and compatibility of displays available.

2) The current popular video standards, VGA and VESA, dictate using separate sync signals, not sync on the green video.

3) No current Apple monitors support sync on green.

4) The new monitors with power-saving modes (monitors which can be put to sleep, thus consuming less energy) typically use the separate sync lines to signal the monitor to enter a low power state. Since separate sync lines run to the monitor anyway, sync on green does not make sense.

5) The ability to strip sync off the green video adds cost and complexity to a monitor.

Question:
My monitor will not work without sync on green, how can I get

Unfortunately, there is very little you can do about this problem. This seems to affect only one or two major Macintosh display manufacturers, and affects only some of their displays.

The cable or adapter doesn't pass separate sync lines to the monitor

---

This is easily fixed by replacing/altering the cable or adapter. Companies such as Griffin Communications provide adapters to provide the sync on green capability.

PLEASE NOTE: One of the main reasons cables and adapters don't pass through the separate sync lines is because sync on green is there in the first place. Since the sync signal on green video causes some monitors to display a greenish tint when they see (and therefore use) the separate sync signals, simply not passing the separate sync signals to the monitor cures the problem. This workaround will fix the problem on a majority of the monitors available.

Revised: 10/28/93
Security: Everyone

LaserWriter Pro: Parallel Cable Connection (10/93)

==========

Article Created: 27 October 1993

TOPIC ----------

I have a LaserWriter Pro 600 connected to a PC ZENITH 486 via the parallel port, and two Macintosh LCII computers connected to the printer via LocalTalk.

When I power on the printer, all the lights flash in a random pattern and the printer never comes ready. The printer only works properly when we power on the PC.

DISCUSSION ----------

The problem lies in the parallel cable being used, and has nothing to do with the printer or associated software. Apple has verified that some parallel cables cause this problem. Unfortunately, we don't have any specifications as to what makes a "good" parallel cable, though Apple support assumes higher quality cables have a better chance of working.

ABS Tech Note: AS02 AppleSearch Q&A (4/95)

Revised: 4/18/95
Security: Everyone

ABS Tech Note: AS02 AppleSearch Q&A (4/95)

==========

Article Created: 23 December 1993
Article Reviewed/Updated: 18 April 1995

TOPIC ----------

This technical note discusses the most common questions asked about AppleSearch.

DISCUSSION ----------

Question: I've got everything set up properly, but when I try to log on to AppleSearch, I'm told "Sorry. This user name refused." What's wrong?

Answer: The server does not have program linking enabled for that user, so the client cannot connect to the server.

Question: When I restart AppleSearch on my Apple Workgroup Server 95, I get the message. "Can't run AppleSearch. Please reinstall." I tried reinstalling and it still wouldn't start. What is wrong?

Answer: AppleSearch creates some temporary files when it runs in the "Temporary Files" folder. If the Macintosh crashes, when you restart this folder gets moved into the Trash so you have the option of recovering files if needed (this isn't needed with AppleSearch). Unfortunately, under A/UX on the AWS 95, if a file or folder exists in the trash, it can't be created again until the trash is empty, which causes AppleSearch to abort.

The solution on the AWS 95 is to empty the trash, not to re-install. The error message is incorrect under A/UX because it is making an assumption it is running on Mac OS.

Question: I wrote our XTND that accepts all file types, (type transparency flags in the FTYP resource all set on). Our XTND works fine if the MacLinkPlus AppleSearch XTND is not installed. If the MacLinkPlus AppleSearch IS installed,

our XTND is NEVER called. Why am I having this problem?

Answer: If both the DataViz translator and another translator say they are able to translate the file, then AppleSearch will use the DataViz translator. AppleSearch should only call your translator if the file was in a format not supported by DataViz. If you only want to search on the information returned by your translator, then you should throw out the MacLinkPlus AppleSearch file. By doing this, you will no longer be able to search on any text in the document that is not returned by your translator. This is because XTND only allows one translator to read a particular file, and since the server has no way to ask a user which translator should be used when there are multiple translators for the same file we always try to prefer the DataViz translators.

Question: I'm having trouble with my scheduled reporters not being run. Why?

Answer: The usual reason why scheduled searches don't run is because the client has been disconnected from the server for some reason. Even if you quit the AppleSearch client software, the Macintosh remains attached to the server. If you disconnect the client, or if the client or server machines are restarted, that connection is lost and needs to be re-initialized.

Question: AppleSearch is forcing my indexes onto the root directory of my AWS 95. How do I move them to some other location?

Answer: AppleSearch 1.0 forces the "AppleSearch Indexes" folder to be at the root of HFS partition. This is fine for HFS disks, but for the UFS disks there are times when you want to move them (if, for instance, /users is a separate disk and you want the indexes there). There is a workaround you can use:

1. Start AppleSearch and create the information source indexes in /

2. Quit AppleSearch

3. Move the index to wherever you want them to exist.

4. Restart AppleSearch. It will ask you where the indexes are, and then remember the new location.

5. Index as usual.

ABS Tech Note: AS03 Search on AWS95 In Non-Root Accounts (9/93)

Revised: 10/28/93
Security: Everyone

ABS Tech Note: AS03 Search on AWS95 In Non-Root Accounts (9/93)

==========

Article Created: 30 September 1993

TOPIC

This article describes the possibility of installing AppleSearch and operating it in a non-root account.

DISCUSSION

While AppleSearch is designed to be operated as part of the server environment on the Apple Workgroup Server (AWS) 95 using the super-user account, it is possible to install AppleSearch and operate it in a non-root account. While this isn't a recommended configuration, it is sometimes useful for testing purposes.

To do this, AppleSearch must be installed using the Installer while logged onto the Workgroup Server as root as you would for a normal install. Then execute the command:

```
mkdir /AppleSearch\ Indexes
```

from CommandShell (note: command is case sensitive, and make sure you use the slash and backslash correctly).

When that directory is created, you can then use the chown command to assign ownership to whatever account will be using AppleSearch. You will then be able to use AppleSearch from that account, although AppleSearch will only be able to index files that can be read by that account.

Finally, if your account or the root account are using a custom System Folder, remember to copy the Claris Folder from root's System Folder to your own so that AppleSearch will have access to the XTND translators.

Note: because AppleShare Pro does not work under any account except root on the AWS 95, you will need to use filesharing for your permissions and access instead.

Macintosh AV Systems: Connecting to Large TVs (10/93)

Revised: 10/28/93
Security: Everyone

Macintosh AV Systems: Connecting to Large TVs (10/93)

==========

Article Created: 28 October 1993

TOPIC --

This article describes how to connect a large-screen television monitor to a Macintosh AV system. (At this writing, these are the Centris 660AV, Quadra 660AV, and Quadra 840AV.)

DISCUSSION --

1) Connect an RCA-type cable from the NTSC video-out port to the TV monitor that you wish to use.

2) In the Monitors control panel, click the Options button, then:
   - choose Display video on Television.
   - choose either NTSC or PAL
   - choose flicker-free format

3) Click OK.

The video-out will then change from the normal display to the TV Monitor that is connected to the computer.

Multimedia Kit for Macintosh: No PMMU Required (10/93)

Revised: 10/29/93
Security: Everyone

Multimedia Kit for Macintosh: No PMMU Required (10/93)

==========

Article Created: 28 October 1993

TOPIC --

The press release for the Multimedia Kit for Macintosh says that a PMMU is required. Why is that? The AppleCD 300 and the AppleDesign speakers individually don't require it.

DISCUSSION --

The press release is in error: a PMMU is not needed. The kit should work with any 68020-class systems with 5MB RAM or more.

System 7 Pro 7.1.1: Mailbox Delivery Frequency (12/93)

Revised: 12/13/93
Security: Everyone

System 7 Pro 7.1.1: Mailbox Delivery Frequency (12/93)

==========

Article Created: 29 October 1993
Article Revised/Updated: 13 December 1993

TOPIC ----------

Mail sent via mail-enabled applications is copied to the Outbasket. The document is then sent to the destination device. If the destination device isn't available, how often does it attempt to deliver mail? How much time must pass before it returns mail as undeliverable?

Mail connection settings in the "I'm At…" dialog box may delay mail delivery. Does a disabled connection prolong the time PowerTalk will wait for the destination device?

DISCUSSION ----------

The mailbox attempts delivery approximately every 15 minutes. For server-less mail, the messages are never considered undeliverable. You have to manually delete items in your Outbasket to get rid of them.

Since server-less mail is never considered undeliverable it doesn't matter if the connection is disabled or not. It won't affect the time PowerTalk will wait for the destination device.

Direct AppleTalk mail and mail sent through PMSAMs will attempt delivery indefinitely. Server-based mail is returned as soon as the mail is determined undeliverable or after five days.

Mail with Waiting status in the out-tray isn't deleted automatically. Mail with Done status is deleted after aging the number of days indicated in Mailbox preferences. The only exception is when mail is sent using a PMSAM and the PMSAM is removed from the key chain. In this situation all mail sent to the PMSAM is deleted along with the PMSAM.

Article Change History:

13 December 1993 - Added information about direct AppleTalk mail sent through PMSAMs.
23 November 1993 - changed title

System 7 Pro: IPM Bin Folder (10/93)

Revised: 11/2/93
Security: Everyone

System 7 Pro: IPM Bin Folder (10/93)

==========

Article Created: 29 October 1993

TOPIC -----

I'm using System 7 Pro on a Macintosh IIfx with 20MB of RAM. A folder called "IPM Bin" is inside the PowerTalk Data folder, which is inside the System Folder. This folder occupies approximately 7MB. It contains many files that have numbers for names. A few of these files are as large as 1.2MB. I believe the files in the IPM Bin folder use more disk space as the computer sits idle.

DISCUSSION -----

The IPM Bin folder is where all the incoming and outgoing messages are saved. (Without a server the messages must be stored locally.) If you start deleting items in the Out Tray and/or In Tray you'll see that the files with the number names will be deleted.

Although the computer may be sitting idle, it can be receiving mail which would create a new file in the IPM Bin folder. This accounts for an increase in disk space used.

ABS Tech Note: AWS12 Retrospect on AWS 95 Q&A (9/93)

Revised: 10/29/93
Security: Everyone

ABS Tech Note: AWS12 Retrospect on AWS 95 Q&A (9/93)

==========

Article Created: 30 September 1993

TOPIC ----------

This technical note answers some common questions on the Retrospect program that runs on the Apple Workgroup Server (AWS) 95.

DISCUSSION ----------

Q) Why are my DAT tapes write-locked?
A) The AWS 95 DAT drive requires MRS (Media Recognition System) format DAT tapes. Standard audio-quality DAT tapes are not MRS format, so the tape drive shows them as read-only, which allows an AWS 95 to read previously written tapes but not to modify them.

Q) Should a StorageSet be placed on a Macintosh Filesystem or a UNIX Filesystem?
A) It is recommended that the Macintosh File StorageSet be located on a Macintosh partition rather than on a UNIX partition. This is because when Retrospect updates a StorageSet, it appends the backup data to the file's data fork, then goes back and writes the catalog data to the file's resource fork. Retrospect displays the message "Updating Catalog" in the status window while this latter stage is happening.

Because Macintosh File StorageSets are created in AppleSingle format, the UNIX file system wants to write the resource fork contiguously. Which requires it to move all the backup data in the data fork. This causes delays, sometimes long enough to make people think Retrospect is hung.

Q) Retrospect isn't backing up my AppleShare.PDS file. Why?
A) Certain files are excluded from backups with Retrospect 2.0. These include AppleShare.PDS, Desktop files and the VM Storage file. None of them can usefully be restored because they're part of the active system

and a restored copy of the file is useless, and they will usually cause compare errors in the log during the verify cycle. Because of this, and because it makes no sense to waste backup media on them, it was decided to exclude them.

ABS Tech Note: AWS14 Tune-up Install of AppleShare Pro (6/94)

Revised: 6/24/94
Security: Everyone

ABS Tech Note: AWS14 Tune-up Install of AppleShare Pro (6/94)

==========

Article Created: 23 June 1994

TOPIC ----------

This article describes the tune-up installation of AppleShare Pro on an Apple Workgroup Server (AWS) 95.

DISCUSSION ----------

The AWS 95 Tune-Up 1.0 and the AWS 95 software upgrade will not update the AppleShare Pro File Server and Admin programs if the customer has changed the location of these programs on the root volume; for example, they may have changed the name of the " Applications" folder or placed the programs in sub-folders. This will result in an incomplete installation of the Tune-Up software.

Unfortunately, the Installer will not advise the customer that an error has occurred, since it was designed to update systems without AppleShare Pro, that is, database configurations.

The customer can complete the installation by "dragging" the File Server and Admin programs (inside the AppleShare Pro folder) from Disk 2 of the AWS 95 Tune-Up 1.0 or the upgrade CD to the folder(s) they have created or re-named. These programs must not be running when the new copies are installed. There is no need to install the File Server extension by hand, unless the extension itself has been re-named, which shouldn't occur.

If you're unsure whether or not your AppleShare has been updated properly, check the release number in the Get Info dialog for each application. Both AppleShare File Server and AppleShare Admin should be release 1.0.1. If they aren't, install updated copies from the Tune-Up disks by hand. Upgrade customers are upgraded to version 1.1

ABS Tech Note: DAL33 IN Clause Limitations (9/93)

Revised: 10/29/93
Security: Everyone

ABS Tech Note: DAL33 IN Clause Limitations (9/93)

==========

Article Created: 30 September 1993

TOPIC ----------

This article describes IN clause limitations.

DISCUSSION ----------

The following code shows a limitation in DAL (all releases through 1.4) when using the SQL IN verb in a DAL procedure. As DAL is currently implemented, you can't pass a parameter to a DAL procedure and use it in the IN clause:

```
procedure testit(inclause)
argument varchar inclause;
{
print inclause;

op;
select * from emp where empno in (inclause);
printall;

}
```

and the following calling sequence:

```
testit('3476,1556')
```

this should resolve itself to:

```
select * from emp where empno in (3476, 1556);
```

which is a legal SQL statement (and works). Trying to do this from a procedure, however, returns the error:

```
ORA-01722: invalid number.
```

under A/UX (oracle 7.0), and

- Error: incompatible operands for operator (-401)
  "network", line 1 : DSNT408I SQLCODE = -401, ERROR: THE OPERANDS OF AN ARITHMETIC OR COMPARISON OPERATION ARE NOT COMPARABLE
  DSNT415I SQLERRP = DSNXODTI SQL PROCEDURE DETECTING ERROR

under DB2.

This limitation will be removed in a future version of DAL.

ABS Tech Note: DAL34 SHARED READONLY SELECT coredump

Revised: 10/29/93
Security: Everyone

ABS Tech Note: DAL34 SHARED READONLY SELECT coredump (9/93)

==========

Article Created: 30 September 1993

TOPIC ----------

This article describes SHARED READONLY SELECT coredump.

DISCUSSION ----------

If you open a database in DAL (in all releases through 1.4) for SHARED READONLY, and then attempt to SELECT data from a non-existent table, the DAL server will coredump. This causes the client to lock up.

At this time, there is no patch or workaround for this problem. It will be resolved in a future release of DAL.

This is an example of the problem:

```
%   idal
Apple Computer Interactive DAL (A/UX)
Execution begins...
DAL version 1.4b5 07/24/93 ORACLE7
Execution Completed Successfully(161)
begin> open oracle dbms.
Execution begins...
Execution Completed Successfully(220)
begin> open database "oracle" as user "scott" password "tiger" for shared
readonly.
Execution begins...
Execution Completed Successfully(360)
begin> select * from foobar; printall.
Execution begins...
Segmentation fault (core dumped)
%
```

Setting Up An AWS 95 Server For ORACLE7 for A/UX (10/93)

Revised: 12/20/93
Security: Everyone

Setting Up An AWS 95 Server For ORACLE7 for A/UX (10/93)

==========

Article Created: 28 October 1993

TOPIC ----------

This technical information was provided by Oracle. This document was not written by Apple or tested for accuracy, but it's included because we feel you might find it useful.

DISCUSSION ----------

Setting Up An AWS 95 Server For ORACLE7 for A/UX Desktop
Victor Grigorieff
September 20, 1993 Apple A/UX 3.0.1

Revised 10/28/93 by Victor Grigorieff

This bulletin explains how to configure an Apple Workgroup Server (AWS) 95 (running A/UX 3.0.1) for use with the product "ORACLE7 Server for A/UX version 7.0". This document contains information which details steps to follow before installing any Oracle software.

Note: This document describes the installation process for A/UX 3.0.1. The process will most likely be different with future versions of A/UX.

This document does not assume that the reader has UNIX experience, but it does assume that the reader has basic Macintosh experience.

Conventions used in this Bulletin
---

* Directories: On the Macintosh, people are familiar with folders. Every Macintosh (running the English language) has by default a folder named "System Folder". A file can be referenced by a full path description. An example path

on a Macintosh would be: "Macintosh HD:Word Processing:My Letter". This path would refer to a file named "My Letter", in the "Word Processing" folder of the disk named "Macintosh HD".

Under A/UX's Macintosh environment, the hard disk is named "/". Under A/UX, and example path would look like: "/:Word Processing:My Letter"

On UNIX, people are familiar with directories. All directories are inside the root directory, "/". An example path would be "/users/oracle/dbs /initSAMP.ora".

* Userid: A userid is an account on a UNIX machine. To log into a UNIX machine, you must provide a username and the appropriate password. Once you have logged into a UNIX machine, you have access to all of the programs and files to which that userid has access.

The superuser, "root", has access to all files and programs. Be very careful when you are logged in as that user.

* Processes: A process is a running image of an executable program. On the AWS 95, you can run 300 processes at once by default. Before you log in, A/UX already has several processes active, performing system functions.

When you run the CommandShell application (or telnet to the AWS 95), a shell process is started to accept the commands you type. If you run a UNIX program, a separate process is created for that program, and will run until it exits or is killed.

On UNIX systems, some programs and files are accessible only by certain users. In general, a process runs with the same permissions as the user who created it. If you set the setuid bit on a program, no matter who runs the program, the process will run with the same permissions as the owner of the program. Some Oracle programs must run with the setuid bit set.

Sometimes processes on UNIX machines will get into a state where they will never exit on their own, and will need to be killed by the system administrator.

* Shell: A shell is a program that looks at the commands you type, and performs the appropriate tasks. There are several shells available on A/UX, each with different features. The root user uses the Bourne shell (/bin/sh). All of the other users use the C-shell (/bin/csh). The different shells have different command languages, so

some commands will work in one shell and not others. Each user has a default shell which A/UX will run when they log in.

The shell is run each time you bring up a new window in the CommandShell application.

* Arguments — an argument is an option that you can specify at the time you invoke a UNIX command that affects the way that command behaves. When you read the description of a UNIX command, it will list the various options available. If you were interested in the -a, -b, and -c options, you could use the command "some_command -a -b -c" or "some_command -abc".

* Environment — An environment is a set of variables and their values. You can view the current environment with the command 'env'. From time to time, you will need to set environment variables to have different values.

* Path — A path is a list of directories where UNIX will look for an executable program. Any command which is not a shell command will be looked for in each of the directories in the path. People usually add the directory which contains the oracle programs to their path to have access to the oracle tools.

* TextEditor — On UNIX machines, you will often have the need to edit text files. People who are familiar with UNIX tend to prefer 'vi' which is a standard UNIX text editor. People who are familiar with the Macintosh tend to use the Macintosh-based "TextEditor" from the Macintosh environment of the AWS 95. Text Editor is located in "/:Applications" and behaves much like TeachText, except you can edit multiple documents at a time.

  You may log in to the console of the AWS 95, and simply double-click on a text file to bring up TextEditor to edit that file.

* Commando — The term Commando refers to the way A/UX brings up a dialog box with a Macintosh interface to common UNIX commands. You do not need to know anything about Commando except that it is there, and can make your life a lot easier. You must be logged into the Macintosh environment of the AWS 95 for this option to be available. You can also bring up the Commando interface from within the CommandShell by typing a command, and hitting command-K instead of enter.

The Workgroup Server 95

The Apple Workgroup Server 95 (AWS 95) is a Macintosh Quadra 950 with special hardware additions, and an enhanced version of the UNIX operating system, A/UX 3.0.1.

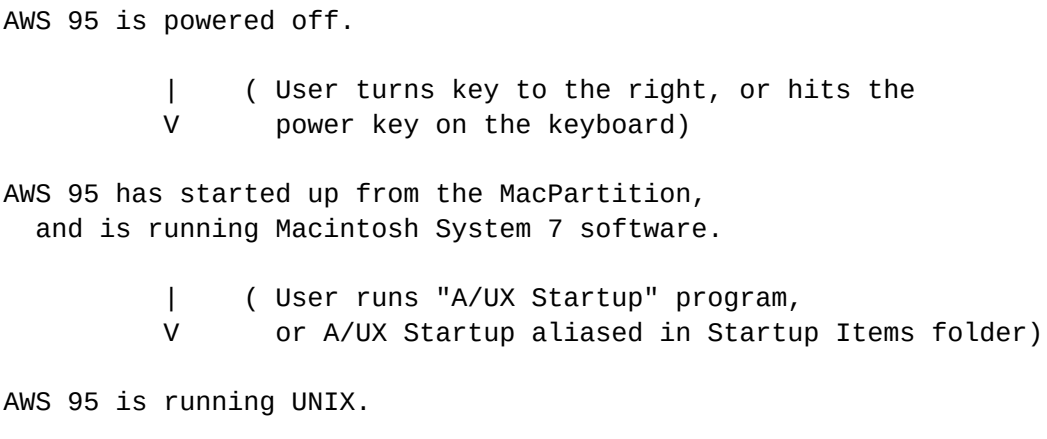
The AWS 95 has a PDS (Processor Direct Slot) card on its motherboard. This card provides faster access to the main memory by using a static RAM cache. The PDS card also provides two extra SCSI buses which are capable of DMA (Direct Memory Access). These two extra SCSI buses are significantly faster than the buses on the motherboard of the machine, and should be used for the drives that contain the database files.

A/UX 3.0.1 is a mix of System V release 2 UNIX, and the Macintosh System Software. When the machine first boots, it reads a Macintosh Partition of the boot disk, and loads the standard Macintosh operating system. A/UX 3.0.1 is then launched by a program called "A/UX Startup". The "A/UX Startup" application unloads the Macintosh operating system and loads in the UNIX operating system. This process is usually automated by placing an alias to the "A/UX Startup" program into the "Startup Items" folder of the System Folder on the Macintosh Partition.

Once the AWS 95 is started under A/UX, there will be a dialog box to log in. When A/UX is first installed, you can log in with the username 'root' with no password. Once you have logged in, the AWS will look like a normal Macintosh. You can then run normal Macintosh applications, including Oracle tools that can connect to the UNIX-based database.

When you are logged in to the console (actually sitting at the machine) and using the AWS 95's Macintosh environment, the AWS is allocating UNIX memory to run the Macintosh environment. You can adjust the amount of memory allocated to this finder environment by adjusting the Virtual Memory size, under the Memory Control Panel. When logged in as root, choose "Control Panels" from the Apple menu (the picture of the apple in the upper-left corner of the screen). Then you can double-click on the Memory icon. You will see a setting called "After Logout" which has arrows to change the number. By default this is set at 16 Megabytes. If you do not intend to run large applications in the Macintosh environment of the AWS, then you can safely set the size down to 8 Megabytes.

The AWS follows this chain of events when it starts up.



```
          * Remote users can log in with telnet.
          * Oracle databases may be started if configured to do so.

                  |    ( User logs into console of the AWS 95 by entering
                  V      UNIX userid and password - root is the superuser)

        AWS 95 is running Macintosh Finder under A/UX
          *  User can now run Macintosh applications, like Oracle Tools.
          *  User can now insert and mount CD-ROM disks, allowing her/him
             to run the A/UX Installer from the ORACLE7 CD Install.
          *  The AWS is now running like it should be for day-to-day use.

                  |    ( User chooses Logout from the Special menu )
                  V

        AWS 95 is still running UNIX, but memory used by the Macintosh
          environment has been freed, allowing more memory to be used
          by other services, like the Oracle database(s).

         | ( User chooses  | ( * WARNING -- this is an emergency measure:
         |   Shutdown from |     User turns key to the left.
         |   Special menu) |      This forces powerdown of the AWS 95.
         |                 |      If it still does not power down, try
         | This is normal. |      hitting button with the triangle on it.
         |                 |
         V                 V

        AWS 95 is powered down.

Installing A/UX on the AWS 95
-----------------------------

A/UX is usually installed on the AWS 95 when it arrives from Apple.  You
MUST install another option before you can successfully install the Oracle7
Server for A/UX.

To Install A/UX:
  *  Power down the AWS 95.
  *  Insert the floppy disk labelled "Apple Workgroup Server 95
     Installation Boot Disk"
  *  Insert the CD-ROM disk labelled
     "System Software Installer Database Service Environment"
  *  Power up the AWS 95.

An A/UX installation consists of 3 parts:
  *  Disk Setup
  *  MacPartion A/UX Startup Files
  *  A/UX Software Setup

  You will want to do custom installs on Disk Setup and A/UX Software
  Setup.  You can do an Easy Install of the Macintosh System Software
  Setup.
```

```
**  Disk Setup
    ----------
    You must partition each of your hard disks for use with A/UX.
    There are several kinds of partitions, and each partition of a disk
      must have a "Slice Number" assigned to it.

    These are the types of slices, and their common uses:

    * MacPartition
      This is a small portion of the startup disk (4 Megabytes) that
      holds a small System Folder.  Don't worry about making this
      partion any larger, as it only needs to be 4 MB to startup A/UX.

      *** When you log into A/UX to run the Macintosh environment,
      *** A different System Folder is used.  If you want to use any
      *** system extensions on your AWS 95's Macintosh environment,
      *** you need to place them in /:mac:sys:System Folder.

    * Root (Slice 0)
      Has the UNIX operating system -- must be present to start A/UX.
      If this file system is "dirty", A/UX will not start.

    * Swap (Slice 1)
      This is a partition which makes up swap space.  The UNIX
      kernel (name for the core of the UNIX operating system) uses
      swap space to complement the physical memory on the machine.
      A/UX can move processes from physical memory (RAM) to disk (swap)
      to make room for other processes.  NEVER try to put a filesystem on
      a swap partition.

        *** Note: Shared memory cannot be swapped out of main memory
                  The ORACLE7 SGA uses shared memory.  This is discussed
                  in greater detail in part 2 of this bulletin.

    * Usr (Slice 2)
      This is a UNIX filesystem which can be mounted on a directory, and
      used for UNIX files.  When you create a Usr slice using the program
      "Apple HD SC Setup", it automatically puts a BSD 4.2 filesystem
      on the partition (which is the equivalent of running newfs).

    * Free (Slice 3 or higher)
      This is a partition with no filesystem on it.  It cannot be mounted
      unless a filesystem is built on it using newfs (BSD 4.2) or
      mkfs (System V)

      A/UX supports two kinds of filesystems-- BSD 4.2 and System V.
      It is more convenient to use BSD 4.2 filesystems, because they
      support longer filenames.  BSD 4.2 filesystems are the default.

    * Database Partition
      This is a partition of the disk with no filesystem on it.  You can
```

configure the A/UX kernel to allow the ORACLE7 database to write directly to database partitions. Using raw database partitions can provide better performance, as the rdbms can bypass the UNIX file buffers. The drawback is that you also bypass the convenient mechanisms for backing up these partitions. Backing up raw partitions is more complex than backing up UNIX filesystems.

*** Warning: Raw database partitions are more difficult to back
*** up, and require familiarity with UNIX administration.

You can choose a custom partitioning scheme that best suits your needs. On a machine with a single 1 Gigabyte hard disk, you might choose the following partition scheme:

Note: 1 MB is 1 Megabyte, which is 1024K. If you are trying to figure out how many megabytes are available on a partition, remember to divide by 1024 (NOT 1000). A partition with 1,000,000 K is actually only 976 MB. This becomes important when you are adding datafiles to the Oracle database.

```
Mac Driver         16 K   (This is required)
MacPartition        4 MB
Swap (Slice 1)     50 MB
Root (Slice 0)    120 MB
Usr  (Slice 2)    825 MB
```

In this scheme, the database files and executables will be placed on the UNIX file system on slice 2. This leaves the A/UX operating system on its own slice 0. It is a very good idea to keep the database on a separate filesystem from the operating system. If the Server ever crashes while the rdbms is running, having the rdbms on a separate filesystem makes the server more likely to start up properly.

Also note in this scheme we did not use Raw database partitions.

In the process of partitioning disks, it is a good idea to keep a notebook where you write down all the information for every slice of every hard disk.

The AWS 95 has 4 separate SCSI buses. For each hard disk and tape drive, it is important to know the bus number and the SCSI ID. Below is a listing of the scsi buses.

	Bus	ID	
	Internal Motherboard	1	
	External Motherboard	2	
*	Internal Cache Card	3	(This is the primary bus)
*	External Cache Card	4	(Good place for CD-ROM and HD's)

* Indicates that the bus is significantly faster. These buses are connected to the cache card in the AWS 95. These buses are

capable of DMA (Direct Memory Access). The Fast external port is the 5th slot from the bottom of the machine. The Slow bus is the 25-pin connector on the right side of the back of the machine, on the edge.

It is important to know the bus and SCSI ID of your hard disks so you can configure your system to use those disks. A slice of a hard disk is referenced by a file in the /dev/dsk directory.

/dev/dsk/cX0Yd0sZ is the generic format for a slice, where:
X refers to the bus number, and
Y refers to the SCSI id, and
Z refers to the slice number.

Examples:
/dev/dsk/c300d0s2 (Usr slice 2, on SCSI id 0 of fast internal bus)
/dev/dsk/c401d0s2 (Usr slice 2, on SCSI id 1 of fast external bus)
/dev/dsk/c302d0s4 (Raw partition 4, on SCSI id 2, of fast internal)

You will need this information when you write the file /etc/fstab, which is necessary to access more than the default root filesystem. This information is also necessary if you intend to use raw database partitions.

** MacPartition A/UX Startup Files

The default Easy Install options for the MacPartition A/UX Startup Files are fine.

** A/UX Software Install

You ** MUST ** perform a CUSTOM install of A/UX to enable the options which are REQUIRED for Oracle7 Server for A/UX

It is a good idea to install at least all of the following options:

* Core A/UX System
* More UNIX Utilities
* Networking Capability
* Network Server Capability
* Manual Pages
* Basic C Programming
* Debugging and Version
* Extended C Programming

If you like, you can install every option, and they do fit comfortably in a partition that is 120 MB.

Post Installation Tasks

* Once the install is complete, the machine will restart, and the CD will be ejected. The machine will boot up to a point where it prompts you to log in.

* Log in with the userid root.
  YOU MUST BE ROOT TO PERFORM THE NEXT SET OF TASKS.

* Choose "Control Panels" from the Apple Menu, and double-click on the "General Controls" control panel. Set the date and time and close the control panel.

  *** It is important to have the date and time set properly before you
  *** run Oracle databases.

* Filesystem Setup:

  You need to set up your machine to mount the filesystems that were created when you partitioned the hard disks. When an A/UX machine boots up, it attempts to mount any filesystems that are listed in the /etc/fstab file. Initially, the fstab file has one entry:

  ```
  /dev/dsk/c300d0s0       /       ignore  rw      1 0
  ```

  The first three columns are the ones which are important:

  /dev/dsk/c300d0s0 This is the disk device file to be mounted. This particular entry refers to Slice 0 of SCSI ID 0 of SCSI bus 3, which is the fast internal bus. (See the Disk Setup section above for more info.

  / This describes where to mount the filesystem. In this case, the slice is being mounted as the root of the filesystem. Other directories could be used as well, like "/data, "/oracle", or "/u1".

  ignore This is the type of filesystem to be mounted.

  * ignore means that the device should not be mounted ignore is used for the / partition, as the fstab file itself is on the / partition, so the / partition must already be mounted if the file is being read. ignore is useful as a placeholder in the file.

  *** 4.2 means that the filesystem is the default BSD 4.2 file system created by either newfs, Apple HD SC Setup, or the A/UX Install process.

  *** The Oracle software requires 4.2 filesystems,
  *** as the names of some files exceed the limits of

*** System V (5.2) filesystems.

* 5.2 means that the filesystem is a System V filesystem. A/UX machines do not normally use these.

* nfs means that the filesystem is actually on an NFS server. NFS is the Network File Service, which allows machines to mount filesystems which are on other machines that are acting as NFS servers.

rw — This specifies a readable and writable filesystem, which is what you want.

1 0 — These parameters affect the checking and backing up of the filesystem, and generally do not need to be changed.

You will need to add an entry for each filesystem other than '/' that you intend to use. Before you mount a filesystem, you need to choose a directory to mount the filesystem on.

Example of setting up a filesystem

It is convenient to make directories in / which follow a consistent naming scheme. For the first filesystem, you could call it 'u1', or any other name you come up with. The name is not important, as long as you use a consistent naming convention.

*** Note: DO NOT MOUNT FILESYSTEMS on the directory called " Shared
*** Data" because the Oracle database will not be able to handle
*** directories with the spaces in their names.

While logged in to the console of the AWS 95 in the Macintosh environment, you could double-click on the '/' disk icon, and then choose "New Folder" from the File menu. You could then type in the name for the new directory, like 'u1'. At this point you will have created a directory on which you can mount a filesystem.

Then you need to remember what disk file corresponds to the filesystem you want to mount. /dev/dsk/c300d0s2 would be the Usr slice 2 of the hard disk at SCSI ID 0 on bus 3. The filesystem is probably a BSD 4.2 filesystem (this is discussed above), so the filesystem type is 4.2.

You would then add the following line to the file and save the file.

```
/dev/dsk/c300d0s2       /u1     4.2     rw      1 0
```

You can use the A/UX command '/etc/fsentry' to automate the editing of the fstab file. If you type the command from the UNIX prompt, it will ask you a few questions. If you double-click on the fsentry icon, you

will be presented with a Commando dialog box with your options. In either case, fsentry will add a line to the /etc/fstab file, and mount the newly entered filesystem.

At the UNIX prompt, type the following command:

df -B (The -B must be a capital 'B')

You should see output like this:

```
Filesystem        kbytes    used   avail %used  Mounted on
/dev/dsk/c0d0s0   140519  119247   14246   89%  /
```

This means that you have only one filesystem mounted. It is mounted on /, and it is almost full (89%).

To mount any filesystems you added to the /etc/fstab file, use the following command:

mount -a

If you see nothing happen that means that it completed successfully, and that all filesystems listed in the /etc/fstab file are mounted. If errors reported, you may have made an error identifying a slice of a disk, or entered a mount point that is not an available directory.

Now the 'df -B' should list several filesystems.

```
Filesystem        kbytes    used   avail %used  Mounted on
/dev/dsk/c0d0s0   140519  119247   14246   89%  /
/dev/dsk/c300d0s  637015      12  637003    1%  /u1
```

In this case, the / filesystem is almost full, and does not have enough room to install an Oracle database. The filesystem mounted on /u1 has over 600 megabytes available, and would be a good place to install the Oracle database. When you run the A/UX Installer to install the database on the server, make sure you are installing in a directory which is in a filesystem with enough available space. In this case, I could make a directory called oracle in /u1, and install the database there.

Note: The sample Oracle installation requires 60 megabytes of space.

* UNIX kernel configuration to enable networking:

If you intend to use TCP/IP, you must configure the UNIX kernel to do so.

If you are only using SQL*Net AppleTalk (and not TCP/IP), you do not need to reconfigure the UNIX kernel, and you could skip this section.

Before you attempt this, you need to make sure that no one else is using the machine, and that you have the following information:

* IP address (A series of 4 numbers, separated by periods (.) that identifies the machine on the network. Also called an Internet address. This unique number is assigned by your network administrator, and must not be used by any other machine on the network. An example address would be 128.20.2.17.)
* Hostname (A name for the machine on the network. This is different from the "Macintosh Name" in the "Sharing Setup" control panel. Hostnames cannot have punctuation characters in them. Example hostnames would be "squid", "aws95", or "saleserver".)
* Domain name (On larger networks, domains may be defined. Most universities, government agencies, and larger companies are on the Internet. This large network is divided into domains. Example domain names would be "us.oracle.com" or "cs.some_college.edu". It is useful to know this information, but it is not required.
  *** Note: This has nothing to do with AppleTalk Zones.)
* Subnet Mask (A series of 4 numbers, separated by periods (.) that tells the machine how to broadcast information to the network. Your network administrator should give you this information, as an error in this parameter can cause problems for your machine and others on the network. The most common masks are 255.255.0.0 and 255.255.255.0. It is extremely rare that a digit in the mask is anything but 255 or 0.)
* NIS Domain (Your site may use NIS (Network Information Services), previously known as yp (Yellow Pages). This is not required, and will cause problems if not properly configured. NIS allows your machine to ask servers on the network for help resolving symbolic names, delivering electronic mail, and other similar tasks.
  *** Warning: If you configure your machine to use NIS and a ypserver is not present on your network, your machine WILL NOT BOOT. If this happens, you will have to rename /etc/ypbind to disable yp.

Once you have this information (and have it written down in your log), you are ready to run the following command:

```
newconfig bnet
```

newconfig will ask you several questions. You give it answers based on the information gathered from your network administrator. In general, when you are asked "Do you want this machine to be an NIS client?", you will answer NO. This avoids the problem described in the warning above.

When newconfig finishes a few minutes later, you should restart the AWS 95 immediately.

Now the A/UX machine has a properly installed and configured operating system, and is ready for an Oracle Installation.

PowerCD: Specifications (10/93) (Discontinued)

Revised: 6/10/94
Security: Everyone

PowerCD: Specifications (10/93) (Discontinued)

==========

Article Created: 29 October 1993
Article Reviewed/Updated: 7 June 1994

TOPIC ----------

This article gives the technical specifications for the PowerCD.

DISCUSSION ----------

GENERAL DESCRIPTION:

Weight

• 1.4 kg

Dimensions (assembled)

• 6.5 inches high
  8.6 inches wide
  4.9 inches deep

Operating temperature

• +41° F to 104 ° F (+5° C to 40° C)

Operating Humidity

• 5% to 90% (no condensation)

Interfaces

• One video/audio port
• One 50-pin SCSI interface port
• One stereo output port
• One headphone port

POWER:

Power Adapter

- One of the following:
  120 V AC, 60 Hz
  230 V AC, 50 Hz
  100 V AC, 50/60 Hz
  240 V AC, 50 Hz

DC Input

- 7 to 11 V, 1.2 A

Power Consumption

- 15 W

VIDEO:

Video Out (CVBS)

- 1 Vpp (75-ohm load)

Signal-to-noise ratio

- >4.5 MHz (PAL)
  >4.2 MHz (NTSC)

AUDIO:

Analog output

- 2 Vrms+/- 2dB

Headphones output power

- ≥ 30 mW (47-ohm load)

Signal-to-noise ratio

- ≥ 95 dB (speakers)
- ≥ 82 bB (headphones)

Dynamic range

- ≥ 80 dB (speakers)
  ≥ 84 dB (headphones)

Channel separation

- ≥ 90 dB (speakers)
  ≥ 75 dB (headphones)

Total harmonic distortion

• ≤ 70 dB (speakers)
  ≤ 75 dB (headphones)

DATA
Data capacity

• 656 MB, Mode 1
  748 MB, Mode 2

Number of blocks per disc

• 270,000 (typical)

Data per block

• 2,048 bytes, Mode 1
  2,336 bytes, Mode 2

Address description

• Minutes, seconds, frames

DATA STREAMING

Blocks per second

• 75

User bytes per second

• 153.6K, Mode 1
  175.2K, Mode 2

SCSI transfer rate

• 2.1 MB per second

Buffer size

• 256K

LASER

Type

• Semiconductor laser GaAIAs

Wavelength

• 780 nm

Output power

• 0.6 mW

Beam divergence

• 54.8°

CD Formats Supported

• Macintosh HFS
• ISO-9660/High Sierra
• Standard CD-DA Audio
• CD-ROM XA, Multisession Kodak Photo CD

Article Change History:
7 June 1994 - Added CD Formats

PowerCD: Available in Two Colors ? (10/93)

Revised: 11/1/93
Security: Everyone

PowerCD: Available in Two Colors ? (10/93)

==========

Article Created: 1 November 1993

TOPIC ----------

Does the PowerCD come in two colors?

DISCUSSION ----------

There were two models (by color) in NTSC and PAL. The Gray was for the business and education channels and the Blue for the consumer. This was the initial strategy. It has since changed. The Blue is no longer available. In Apple USA, model HOO14ll/A, which was Blue, changed to H0014LL/B, which is Gray. The only difference today between the business and consumer channel models are the CDs that come with the PowerCD.

Macintosh AV Systems: Using with Television Monitor (11/93)

Revised: 11/1/93
Security: Everyone

Macintosh AV Systems: Using with Television Monitor (11/93)

==========

Article Created: 1 November 1993

TOPIC ----------

When I connect my Quadra 660AV to a television monitor (I've tried several different monitors) through S-video or composite, the image is pretty clear. But if I select a solid desktop pattern, the color is off. For example, a red desktop starts out blue at the top of the screen, but fades to red and to purple. This happens at all bit depths.

DISCUSSION ----------

Some discoloration can occur because televisions have marginal purity specifications, compared to computers. You can see some improvement by correctly setting the gamma setting. Here's how:

1) Open the Monitors control panel.

2) While holding down the keyboard's Option key, click the control panel's Options button.

3) Gamma settings will appear. Select the one for television, and the color should improve.

Gamma correction is used to match the computer color tables to the monitor or television set it is connected to. This is necessary because all monitors and television sets do not reproduce color identically.

Remember that the gamma setting for televisions is a "best guess gamma" because the gamma varies significantly from one television to another.

SIMMs: Double-Sided vs. Composite (11/93)

Revised: 11/1/93
Security: Everyone

SIMMs: Double-Sided vs. Composite (11/93)

==========

Article Created: 1 November 1993

TOPIC ----------

This article clarifies the difference between composite SIMMs and double-sided SIMMs.

DISCUSSION ----------

Composite SIMMs

A composite SIMM uses lower-density components to construct a single bank of memory. An example would be a 16MB SIMM that uses 4MB components to construct one or two banks of memory. A non-composite 16MB SIMM uses 16MB components to construct one bank of memory. If a SIMM uses lower-density components to make up a bank of memory, it is a composite SIMM -- and is not recommended nor supported by Apple.

It has always been Apple's position that composite SIMMs are, by design, incompatible with all Macintosh systems.

Double-sided SIMMs

The double-sided SIMMs available for use in the newer Macintosh systems are not the same thing. A double-sided SIMM consists of two separate banks of memory using the correct density components for each bank. An example would be a double-sided 8MB SIMM, which uses 4MB components to construct two separate banks of 4MB each. These SIMMs can be used in Quadra and Centris systems, because the design of the logic board allows each SIMM slot to contain two banks of memory, not just one as in previous systems.

If a bank of memory is to contain 4MB, the components for that bank should be 4MB. If the bank is to contain 16MB, the components that make up that bank must be 16MB.

Macintosh TV: If You Forget Your Password (11/93)

Revised: 11/1/93
Security: Everyone

Macintosh TV: If You Forget Your Password (11/93)

==========

Article Created: 1 November 1993

TOPIC -----

If you create a password to lock out the TV mode of your Macintosh TV, and then forget the password, here's what to do.

DISCUSSION -----

1) Find the file named "TV Preferences" and drag it into the Trash.

2) Restart your Macintosh TV.

3) After the computer starts up, the TV Setup control panel will create a new "TV Preferences" file.

4) Set up the channels, name them, and create a new password if you wish.

MacTCP 1.1.1 and Hebrew (11/93)

Revised: 11/2/93
Security: Everyone

MacTCP 1.1.1 and Hebrew (11/93)

==========

Article Created: 1 November 1993

TOPIC --

I'm unable to configure MacTCP 1.1.1 when using the Hebrew version of System 6.0.7. When I pull up the MacTCP Control Panel, the numeric fields are black and do not accept entry of configuration information.

Is this a known problem?

DISCUSSION --

We've duplicated the problem you reported with the Hebrew Operating System (OS) and believe to have found the workaround.

After you've installed both the Network Software Installer and MacTCP on your Macintosh running Hebrew 6.0.7, prior to configuring MacTCP you'll need to do the following:

1) Via the Hebrew Interface System Control Panels device, select left-to-right.

2) Select the Roman Script Manager (click on the Hebrew "Star" and the Roman "Diamond" will appear in its place).

After configuring your Operating System in this fashion, you should then be able to configure MacTCP.

PowerBook: Using with LCD Projection Panels (12/93)

Revised: 7/8/94
Security: Everyone

PowerBook: Using with LCD Projection Panels (12/93)

==========

Article Created: 22 December 1993

TOPIC -----

Can a PowerBook 180c be used with an LCD display from 3M or nView?

DISCUSSION -----

In addition to the PowerBook 180c, the following information applies to PowerBook models EXCEPT 100, 140, 170, 145, 145B, and Duos.

nView Corp.

All of their ViewFrame LCD projection panels are compatible. One configures the panel in the PowerBook Display CDEV as an 'optional' monitor. One known problem they are aware of is with their II+2 panel: when the PowerBook's screen dims, the video signal "is lost" necessitating you to restart your PowerBook. They recommend turning dimming off when using a ViewFrame II+2 panel with a PowerBook.

3M Visual Systems Division

3M distributes series 5000 and 4000 panels. The series 4000 panels are plug-and-play, except that one configures the PowerBook Display control panel to 'mirror.' The series 5000 panels ship with their own Y-cables, and if you don't have a monitor connected to the Y-cable along with the LCD panel, you then must connect a terminator to this cable. If you don't have a (12, 13 or 14") display nor terminator connected, then no video signal is sent to the LCD panel. Terminators are available from 3M. Configure the PowerBook Display control panel for the 5000 series panels as you would for the 4000 series panels.

Problem with A/UX lpr Queue (11/93)

Revised: 11/9/93
Security: Everyone

Problem with A/UX "lpr" Queue (11/93)

==========

Article Created: 1 November 1993

TOPIC ----------

Under A/UX 3.0.2, I did the following:

"lpr -PLP1 /spoolin/long" and got error message " lpr: /spoolin/long: copy file is too large". How can I fix this? I need to spool files bigger then 800K, and that seems to be a limit set in A/UX somewhere? Has this got to do with ulimit?

DISCUSSION ----------

The problem you are seeing is not caused by ulimit. The lpr spooling system has a default maximum "copy size" of 1000 blocks. This is the largest file size it can print.

This can be increased by modifying the /etc/printcap file. All that is needed is to add a field to the entry for the queue where the large print jobs will be printed.

The field to be added is "mx". If the value of "mx" is set to 0 (zero), then it sets the size to unlimited.

For example,

```
lp|at|AppleTalk|postscript|PostScript:\
        :mx=0:\
        :lp=/dev/null:\
        :if=/usr/spool/lpd/AppleTalk/ifilter:\
        :of=/usr/spool/lpd/AppleTalk/ofilter:\
        :nf=/usr/spool/lpd/AppleTalk/nfilter:\
        :sd=/usr/spool/lpd/AppleTalk:
```

Please note that the second line says

```
    :mx=0:\
```

The lpr system will create temporary files before sending them to the printer, if you set the value of "mx" to 0 (zero), you could run out of disk space on the volume where the spool directory is located.

There are a couple of options to prevent this from happening.

One option is to create the file "minfree" in each spool directory for a queue set as unlimited.

The file minfree in each spool directory contains the number of disk blocks to leave free so that the line printer queue won't completely fill the disk. You can edit the minfree file with your favorite text editor.

The file should only contain one line with the number of blocks, for example:

```
5000
```

What this will do is prevent the lpr spool system from creating temporary files if the disk had less than 5000 blocks free.

The other option is to use the "-s" flag of the lpr command. This flag causes symbolic links to be created in the spooler directories instead of copies of the files to be printed. By creating the symbolic links, this option conserves the file-system space available.

```
$ lpr -s -PLP1 ...
```

For more information consult the A/UX manual page for lpr(1).

Newton MessagePad: Date Book Error -48009 (8/94)

Revised: 8/2/94
Security: Everyone

Newton MessagePad: Date Book Error -48009 (8/94)

==========

Article Created: 2 November 1993
Article Reviewed/Updated: 2 August 1994

TOPIC

When I open a Date Book appointment, my Newton MessagePad displays a -48009 error. What causes this and how can I recover from it?

DISCUSSION

This error occurred in version 1.0, 1.02, and 1.03 of the Newton Operating System. You should upgrade to version 1.05 of the Newton Operating System to permanently correct this problem.

These articles can help you locate the software update mentioned here:

- "Where To Find Apple Software Updates"
  Lists online services for "free" Apple software updates.

- "Obtaining Apple Product Support in the USA"
  Lists 800 numbers and online services for software updates, Apple support information, and a subset of the Apple Tech. Info. Library.

If you are using a Newton Operating System older that 1.05, your Date Book appointment has become corrupted. Whenever this appointment is opened, your MessagePad displays the -48009 error message. If you receive this error message, you must reset your MessagePad.

To cure this problem, you must delete the appointment. Since the error occurs when you view the slip for the damaged appointment, you can't delete the appointment within the Date Book application. Try these steps to delete the appointment:

1) Select a word in the text of the corrupted appointment that you can use with the Find command.

2) Create a new note in the Notepad with the word selected above.

3) Tap the Find button, enter the selected word, then tap All. The Find command will search through the Name File, Notepad, and Date Book. When the find is complete, an overview window will appear with all the found items.

4) If any of the items found are outside the Date Book, such as a Name File or Note Pad entry, go to each item and remove the selected word. Do this for all items except for the note created in step 2.

5) Repeat steps 3 & 4 until the overview only shows the note created in step 2 and the corrupted Date Book item.

6) Tap on the envelope button in the bottom right corner of the screen and choose Delete. This will delete the sample note and the corrupted Date Book item.

7) Repeat the above steps for other Date Book items that are producing the error.

Article Change History:
02 Aug 1994 - Added Newton OS 1.05 which corrects this problem.

Newton MessagePad: Installing System Updates (10/94)

Revised: 6/5/96
Security: Everyone

Newton MessagePad: Installing System Updates (10/94)

==========

Article Created: 2 November 1993
Article Revised/Updated: 24 October 1994

TOPIC -----

How do I install system updates onto my Newton MessagePad?

DISCUSSION -----

Apple is currently distributing system updates for your Newton MessagePad by the following methods:

- If you have the Newton Connection Kit for Macintosh or Windows, you can:

  1) Call the Newton Fulfillment Center at 1-800-242-3374 and order a floppy disk containing the system update. You can then use your Newton Connection Kit to download the system update from your personal computer to your Newton.

  2) Download the system update from on-line services, such as AppleLink, Compuserve, America Online and others. You can then use your Newton Connection Kit to download the system update from your personal computer to your Newton.

- If you do not have the Newton Connection Kit, you can call the Newton Fulfillment Center at 1-800-242-3374 and order the system update on a PCMCIA card. You can then transfer the system update from the PCMCIA card to your Newton.

The instructions below work with Newton System Update 1.05. Earlier system updates had other distribution methods and slightly different installation instructions.

Installing by Connection Kit

To install a system update with the Newton Connection Kit, follow these steps:

1) Connect your personal computer to your Newton. (See your Newton Connection Kit manual for instructions.)

2) Open the Newton Connection Kit on your personal computer.

3) Synchronize and back up the information in your Newton.

NOTE: You must back up the information in your Newton BEFORE installing the update. Installing System Update 1.05 will erase all information in your Newton. Earlier system updates did not erase your Newton's information.

4) Click the Install Package icon on your personal computer.

5) Select the system update in the dialog box, then click OK. For System Update 1.05, select "Update 1.05 for Connection."

6) On your Newton, open the Extras drawer and tap Connection.

7) Tap the type of connection you are making between your Newton and your personal computer, then tap Connect

8) Your Newton will ask if you have backed up your information, because installing the update will erase your information. If you have made a backup, tap OK.

9) Your Newton will ask you to confirm that you have backed up your information. Tap OK. The update is now installed.

   Once the update is installed, your Newton will restart.

10) Follow the instructions that ask you to tap several Xs on your Newton screen.

11) On your personal computer, click OK in the dialog box telling you that installation was successful.

12) Click Restore. In the dialog box that appears, locate and select your backup file to restore your information.

You've now installed the system update and restored the information in your Newton. The version number at the bottom of your Newton's Prefs should now be 1.05.

NOTE: Be sure to reset the date and time in the Date and Time preferences.

Installing by PCMCIA Card

To install a system update with a PCMCIA card, follow these steps:

1) Back up the information in your Newton using Newton Connection or a Memory Card. (See your Newton MessagePad or Newton Connection Kit

documentation for instructions.)

NOTE: You must back up the information in your Newton BEFORE installing the update. Installing System Update 1.05 will erase all information in your Newton. Earlier system updates did not erase your Newton's information.

2) Turn off your MessagePad and remove your current PCMCIA card.

3) Insert the PCMCIA card which contains the system update and close the card lock switch. The system update will automatically download.

4) Your Newton will ask if you have backed up your information. If you have made a backup, tap OK. If not, back up your information as described above and begin this procedure again.

5) Newton asks you to confirm that you have backed up your information. Tap OK. The system update is installed.

   Once the update is installed, your Newton will restart.

6) Follow the instructions that ask you tap several Xs on your Newton screen.

7) Restore your information either from your card or from the Newton Connection Kit.

You've now installed the system update and restored the information in your Newton. The version number at the bottom of your Newton's Prefs should now be 1.05.

NOTE: Be sure to reset the date and time in the Date and Time preferences.

If have any problems following these instructions, you can call 1-800-871-6633 or 1-800-SOS APPL (767-2775) for assistance.

Article Change History:
24 Oct 1994 - Reviewed for consistency and updated format.
25 Jan 1994 - Revised methods and sources of Newton System Updates.

Newton MessagePad: Dialing Options and Personal Prefs (11/93)

Revised: 11/2/93
Security: Everyone

Newton MessagePad: Dialing Options and Personal Prefs (11/93)

==========

Article Created: 2 November 1993

TOPIC -----

When I dial a local telephone number, the area code is shown in the call slip. I checked the Local Dialing Information dialog box and the local area code is set properly.

Also, when I dial a long distance number, a "1" is not appended to the telephone number.

Why is this?

DISCUSSION -----

Both of these situations are caused by settings in your MessagePad's Extras drawer. To ensure that telephone numbers are properly displayed, follow these steps:

1) Tap the Time Zones button in the Extras drawer, then tap your location on the world map.

2) Tap the I'm Here button, then tap X to close the window.

Also, be sure that the Country blank in the Personal and Locale Preferences is set to your home country.

Imagewriter I/II: Minimum Margins (5/94)

Revised: 5/4/94
Security: Everyone

Imagewriter I/II: Minimum Margins (5/94)

==========

Article Created: 3 November 1993
Article Reviewed/Updated: 4 May 1994

TOPIC ----------

What are the minimum margins for the ImageWriter I? I am printing from a Macintosh Plus to an ImageWriter I in landscape mode and the top .50" of each page is being clipped. I need 1/8" margins.

DISCUSSION ----------

Here are the minimum margins for the ImageWriter I or ImageWriter II printer:

Top and Bottom - .25"
Left and Right - .50"

With these margins the maximum printable line is 7.5-in. not 8-in. as the manual states.

NOTE: These margins depend on correct placement of the paper on the platen, and may only be achieved if the application supports it.

With regard to the image being clipped, this is because the margins have been set to be less than the minimum. Some applications will warn the user that they have set the margins to less than the minimum, but some will not and the resulting "clippage" will occur.

Article Change History:
4 May 1994 - Added maximum pritable area.

LaserWriter Select 310: With PC Windows 3.1 (11/93)

Revised: 11/3/93
Security: Everyone

LaserWriter Select 310: With PC Windows 3.1 (11/93)

==========

Article Created: 3 November 1993

TOPIC ----------

I am trying to get a LaserWriter Select 310 to work with a PC running Windows v3.1. I have run through the installation for Windows and everything seems to be fine. However, when a job is sent to the printer, the LaserWriter Select just flashes its green light and nothing happens.

DISCUSSION----------

With the green light flashing, it seems that the printer is not receiving the CTRL-D (EOF) character that it needs to print the job. The CTRL-D should be taken care of by the Windows PostScript driver. The only other things to check are:

- The parallel cable is bad. There have confirmed reports of bad parallel cables "disabling" the printer. You might want to try at least a couple different cables.

- Incorrect installation of the software. A very important step is installing the Windows Postscript driver from Windows Disk #6 (this is step 10 and 11 in Chapter 1, page 9 of the LaserWriter Select 310 User's Guide). The latest PostScript driver version is at least v3.53.

- A bad or incorrectly configured parallel interface card. Apple has heard that some cards have configuration DIP switches or jumpers.

- A bad printer I/O board. Does the test page print? Does the printer work if connected to a Macintosh?

Performa Computers: Display Support (7/94)

==========

Article Created: 3 November 1993
Article Reviewed/Updated: 06 July 1994

TOPIC ----------

This article lists the various monitors supported by Performa computers which will drive an external monitor.

DISCUSSION----------

The Performa 410 supports:

Apple Basic Color Display: (256K/8-bit, .5MB/thousands)
Macintosh Monochrome RGB Displays: (256K/4-bit, 0.5MB/8-bit)
Macintosh 13 & 14-inch Displays: (256K/4-bit, 0.5MB/8-bit)

The Performa 460, 466, & 467 supports:

Apple Basic Color Display: (0.5MB/8bit, 768K/thousands)
Macintosh Monochrome Displays: (0.5MB/8bit, 768K/8-bit)
Macintosh 13 & 14-inch RGB Displays: (0.5MB/8bit, 768K/thousands)
Portrait Display: (0.5MB/4-bit, 768K/8-bit)
Macintosh 16-inch RGB Display: (0.5MB/8bit, 768K/8-bit)

The Performa 475 & 476 supports:

Apple Basic Color Display: (0.5MB/8-bit, 1MB/thousands)
Macintosh Monochrome Displays: (0.5MB/8-bit, 1MB/8-bit)
Macintosh 13 & 14-inch RGB Displays: (0.5MB/8-bit, 1MB/thousands)
Portrait Display: (0.5MB/4-bit, 1MB/8-bit)
Macintosh 16-inch RGB Display: (0.5MB/8-bit, 1MB/thousands)
19-inch landscape: (third party): (0.5MB/4-bit, 1MB/8-bit)

Macintosh 21-inch RGB Display: (0.5MB/4-bit, 1MB/8-bit)

SCSI Disk Mode: Quitting SCSI Disk Mode (11/93)

Revised: 7/8/94
Security: Everyone

SCSI Disk Mode: Quitting SCSI Disk Mode (11/93)

==========

Article Created: 2 November 1993

TOPIC ----------

When I used SCSI disk mode my PowerBook hard drive crashed. Now I have to reformat the hard drive because Norton Utilities and Disk First Aid couldn't fix it. What may have caused this crash?

DISCUSSION ----------

Follow the steps in the Macintosh User's Guide (for your PowerBook) for connecting and disconnecting SCSI devices to avoid loss of information and damage to your equipment.

When using SCSI Disk Mode, the proper way to quit SCSI Disk Mode is to:

- Shut Down the Macintosh your PowerBook is connected to.
- Press the power button on the back of the PowerBook to turn it off.
- Turn off any other SCSI devices in the chain.
- Disconnect the PowerBook from the adapter cable.
- Disconnect the cables from the Macintosh.

NOTE:
1) If you leave the adapter cable attached to the PowerBook, the computer will behave as though it is still in SCSI disk mode when you try to restart.

2) If you unmount the PowerBook's SCSI icon by dragging it to the trash it may lock up the computer and possibly damage the directory information on any mounted hard drive. The damage may only be repaired by reformatting.

Newton MessagePad: Erasing a Corrupted PCMCIA Card (11/93)

==========

Article Created: 3 November 1993

TOPIC -----

This article discusses how to erase a corrupted PCMCIA card.

DISCUSSION -----

If you have a corrupted PCMCIA card that your Newton MessagePad that won't recognize follow these steps:

1) Remove the PCMCIA card from your MessagePad and restart the MessagePad.

2) Tap the Extras button, then tap Prefs.

3) Insert the corrupted PCMCIA card into your MessagePad. A dialog will appear which asks if you want to erase your card. Tap Yes.

Your card should now work correctly.

At Ease 2.0: GrayShare 1.0 (8/95)

==========

Article Created: 4 November 1993
Article Reviewed/Updated: 9 August 1995

TOPIC -----

I have a ten Macintosh LC 520 computers running At Ease 2.0. Four StyleWriter II printers are connected directly to four of the LC 520 computers and they print fine. Other users trying to print (to a StyleWriter II) through GrayShare software, version 1.0 cannot find the printer in the Chooser.

If I turn off At Ease 2.0, and startup into the Finder, remote users can print to the StyleWriter II with GrayShare just fine.

DISCUSSION -----

Install version 1.1 or later of Printer Share (GrayShare's system extension), and everything should work fine.

Apple was able to reproduce the problem and determined that it's a problem with the 1.0 version of Printer Share.

Centris, Quadra 610 and 660AV: Internal Pinouts

Revised: 11/8/93
Security: Everyone

Centris, Quadra 610 and 660AV: Internal Pinouts

==========

Article Created: 4 November 1993

TOPIC -----

This article supplies the internal pinouts (for the internal cord connecting the power supply to the logic board) for four Macintosh systems:

- Centris 610
- Quadra 610
- Centris 660AV
- Quadra 660AV

(The Quadra 650 and Centris 650 have a different power supply.)

DISCUSSION -----

The power supply provides three connectors: one for the hard drive, one for the CD-ROM drive, and one for the logic board.

Logic Board Connector

The pinouts for the 10-pin power connector that plugs into the logic board at J30 are (the location of Pin 1 and 10 are marked on the logic board):

1 - +5V
2 - +5V
3 - +5V
4 - Gnd
5 - Gnd
6 - N/C
7 - Gnd
8 - Gnd
9 - +12V
10 - -12V

Hard Drive and CD-ROM Drive

The pinouts for the power connector for the hard drive and CD-ROM drive:

1 - +12V
2 - Gnd
3 - Gnd
4 - +5V

Apple Color Plus 14" Display: Specifications (12/93)

==========

Article Created: 4 November 1993
Article Reviewed/Updated: 10 December 1993

TOPIC ----------

What are the specifications for the Color Plus 14" Display?

DISCUSSION ----------

Picture Tube

- Shadow Mask
- 14-inch diagonal, 13-inch viewable CRT
- 0.28 mm dot pitch

Scanning and refresh rates

- 35-kHz Horizontal frequency
- 67 Hz Vertical refresh rate

Video

- Resolution: 640 horizontal by 480 vertical pixels
- Active raster width: 9.4 inches (nominal)
- Active raster height: 7 inches (nominal)

Controls

- Brightness
- Contrast
- Power on/off
- Horizontal and Vertical Shift Controls on the front of the unit.

Physical Measurements

- Weight: 25.3 lbs (11.5 Kg)

- Height: 12.9 inches (32.8 cm)
- Width: 14.5 inches (36.8 cm)
- Depth: 15.2 inches (38.5 cm)

Power Supply

- Input voltage: AC 100-125V
- Input frequency: 50-60Hz
- Input current: 1.2A max. (at 120VAC)
- Consumption: 70W

BTU/hour

- 273.2 BTUs per hour

Environmental Requirements

- Operating ambient temperature: 5° C to 35° C
- Humidity: 10% to 80% (non-condensing)
- Altitude: to 7,000 feet
- Storage temperature: -40° C to 65° C

CIE coordinates

- Red x = 0.625 +-0.020, y = 0.340 +-0.020
- Green x = 0.280 +-0.020, y = 0.595 +-0.020
- Blue x = 0.155 +-0.015, y = 0.070 +-0.015

Luminance

- 25 foot lamberts (+-3 foot lambers)

Input Voltage Range

- 90-134 Vrms, USA version
- 200-265 Vrms, Euro version

Signal Connector

- 15-pin D shell connector

Pin	Function
1	Red signal
2	Green signal
3	Blue signal
4	Jumper to pin 10
5	Self test
6	Red return
7	Green return
8	Blue return
9	No pin

10	Digital ground
11	Jumper to pin 10
12	No pin
13	Horizontal sync.
14	Vertical sync.
15	No pin

Safety

• Meets strict SWEDAC MPR-2 requirements for low-frequency (ELF and VLF) magnetic and electric emissions.

Order Number

• M2346LL/A

LaserWriter Pro: Smudging with Duplex Printing 11/93

Revised: 11/4/93
Security: Everyone

LaserWriter Pro: Smudging with Duplex Printing 11/93

==========

Article Created: 4 November 1993

TOPIC ----------

When attempting duplex printing the top inch of the second side is smudged.

DISCUSSION----------

The cause of the smudging on the second side is due to the top edge paper curl that the paper gets on the first pass. This curling is due to humidity, type of paper used and the heat of fusing.

One work around is to print the second side by:

1) Use "Page Setup" to flip the image both vertically and horizontally
2) Use the Multipurpose Tray
3) Feed the trail edge first into the printer

By flipping the image vertically and horizontally in the "Page Setup" menu, the original trailing edge of the page is fed into the printer rather than the original leading edge.

AWS 95, Retrospect, and ADIC Autochanger (11/94)

Revised: 11/23/94
Security: Everyone

AWS 95, Retrospect, and ADIC Autochanger (11/94)

==========

Article Created: 3 November 1993
Article Reviewed/Updated: 23 November 1994

TOPIC ----------

ADIC 1200C autochanger makes a DAT Jukebox, will this work on an Apple Workgroup Server (AWS) 95 with Retrospect for backup purposes?

DISCUSSION ----------

This device is fully supported by Retrospect 2.0 and later. We talked with ADIC and Dantz to verify that this drive would work with an AWS 95, and both companies confirmed that it would work. The only thing you need to know is that when they configure the drive and autoloader, is to set the SCSI ID of the tape drive to 0, 1, 2, or 3 and then set the SCSI ID of the autoloader to 3 ID's higher (3, 4, 5, or 6) in relation to the tape drive SCSI ID.

Potential Problems

Opening the door to the autoloader (inserting tape cartridges) takes the mechanism off the SCSI bus. The SCSI bus must be scanned again with the door closed for Retrospect to recognize the autoloader.

SNA•ps 2.0 Gateway: Configuring Mixed Session Types (11/93)

Revised: 11/5/93
Security: Everyone

SNA•ps 2.0 Gateway: Configuring Mixed Session Types (11/93)

==========

Article Created: 3 November 1993

TOPIC ----------

Is the 70 session license limit on a per SNA•ps gateway basis? In other words: Can I run a single Token Ring card and get a total of 70 sessions (mixed 3270 and APPC), or do I have to run multiple gateways to get both 3270 and APPC functionality?

DISCUSSION ----------

There is no such thing as a 70 session gateway, it is a 70 AppleTalk client limited gateway. It does not matter how many sessions are configured on the SNA•ps 2.0 Gateway. The only limit is 70 attached Macintosh computers over AppleTalk.

You can run a single Token Ring card with both 3270 and 5250 (APPC) services at the same time. This is how our demonstration gateways and our test gateways are configured. The session limit will be determined by the RAM size on the Token Ring card. In this environment we strongly suggest buying the 2MB upgrade memory chips.

This is done by configuring two separate SNA•ps Token Ring Lines and Partners. The first pair of lines and partners would be for 3270 services. It would be a Host type PU 5 connection for a PU2 gateway. The customer then does an NCP and VTAM config for the PU 2.0 (3270, 3287) devices and the SNA•ps gateway is matched with 3270 resources.

The second pair of lines and partners would be a PU 2.1 Peer-to-peer device which supports APPC sessions to the AS/400. You would configure a Controller, device, and mode description to support this attachment. Obviously, there are two Token Ring addresses as destination addresses (one for the source of the 3270 datastreams and one for the source of the AS/400 datastreams. The Macintosh Token Ring card will be given one Token Ring address and it will be used as the destination for both the 3270 and AS/400 datastreams. When this is all said and done, there is one gateway with one

AppleTalk name projected on the LAN for both types of services. This can be done all on one card.

As an example: you could have 50 3270 sessions and 55 APPC sessions to support 5250 in the SNA•ps Config. Lets say a Macintosh AppleTalk client attaches to the SNA•ps gateway and opens three 3270 sessions, two 5250 sessions, one SNA•ps Print 3287 session, and one DAL AS/400 session. This SINGLE AppleTalk client has used 3 + 2 + 1 + 1 = 7 sessions.

Quadra 610: How to Tell If It Has An FPU, How to Upgrade (11/93)

Revised: 11/30/93
Security: Everyone

Quadra 610: How to Tell If It Has An FPU, How to Upgrade (11/93)

==========

Article Created: 11 November 1993
Article Reviewed/Updated: 16 November 1993

TOPIC ----------

Some Quadra 610 configurations come with an FPU, and some don't. How can I tell whether one of these systems contains an FPU?

DISCUSSION ----------

Background

There are three different Quadra 610 configurations sold the in the U.S.

- Two of them contain a Motorola 68040 processor, which has an integral FPU (floating-point unit, or math coprocessor).
  M2098LL/A* Macintosh Quadra 610 (8MB RAM, 230MB HD)
  M2099LL/A* Macintosh Quadra 610 (8MB RAM, 230MB HD, AppleCD 300i)

- One contains a Motorola 68LC040 processor, which has no integral FPU. This configuration is sold only in the U.S.
  M2319LL/A* Macintosh Quadra 610 (8MB RAM, 160MB HD, no FPU)

How to Tell If a Quadra 610 Has an FPU

- Run MacCheck or other utility that reports whether an FPU is present.

- Run a program that requires an FPU -- such as some rendering or CAD/CAM applications.

- Open the case and examine the processor. A processor without an FPU will be labelled "68LC040".

How to Upgrade

If your Quadra 610 has no FPU and you wish to upgrade, you need to purchase a

third-party upgrade kit, as Apple does not offer this upgrade.

Article Change History:
11/16/93 - Corrected reversed definitions of 68040 and 68LC040.

A/UX and MacTCP: Only One Network Available To Finder (11/93)

Revised: 11/5/93
Security: Everyone

A/UX and MacTCP: Only One Network Available To Finder (11/93)

==========

Article Created: 4 November 1993

TOPIC -----

I have two Ethernet cards for accessing two different networks, 1 internal and 1 to Internet). I have set up bnet properly and can use "command shell" ping, ftp, and so on to either network. However, I can't use the Finder to access both networks simultaneously. I can only access the one indicated in the MacTCP control panel.

Questions:

1) Is this possible from the A/UX Finder to access different networks on different IP nets? I don't believe it is possible from the system 7.0.1 finder.

2) How can I change what IP network is accessible from the A/UX Finder if only one is accessible at a time?

DISCUSSION -----

That is the correct behavior for MacTCP running under A/UX. The only way to access both networks without switching interfaces in the MacTCP control panel is to make the A/UX system into an IP router. Refer to the A/UX manuals for information on how to turn A/UX into an IP router. The manual neglects to mention the need to turn on the "ipforwarding" variable in the kernel to enable routing, so that information is included below.

As a super user, you can turn the "ipforwarding" parameter on by doing the following adb (kernel debugger) command:

```
     # adb -w /unix
 ===> a.out file = /unix (COFF format)
 ===> cannot open core
 ===> ready
      ipforwarding?D
```

```
 ===> ipforwarding:   0
      ipforwarding?W 1
 ===> ipforwarding:   0x0      =     0x1
      $w
      $q
 ===> #
```

Then reboot A/UX so that the change will take effect. You might also want to make the same change to the /etc/install.d/boot.d/bnet_dr file (adb -w bnet_dr) in case you build a new kernel via newconfig at some later date.

If you would rather not reboot, do

```
     # adb -w -w /unix /dev/kmem
 ===> a.out file = /unix (COFF format)
 ===> core file = /dev/kmem
 ===> ready
      ipforwarding/W 1
 ===> ipforwarding:   0x0        =    0x1
      $w
      $q
```

This changes the running kernel (/dev/kmem) without affecting what will happen after the next boot. You can do both changes in one session. The "-k" flag is recommended when working on stand alone programs such as the kernel.

Using ARA and FAX On A PowerBook Duo and Dock (11/93)

Revised: 7/8/94
Security: Everyone

Using ARA and FAX On A PowerBook Duo and Dock (11/93)

==========

Article Created: 4 November 1993

TOPIC ----------

On a PowerBook Duo, when I use the Express modem for AppleTalk Remote Access (ARA), an external modem for FAX receive, the other serial port cannot be used for a serial printer, right? I know the Express modem is a bus modem, not a serial modem, but I thought it precluded the use of the serial port. In any case this is not working, and I just want know what configuration should work.

I'm setting this up for my CEO who wants to receive and send FAXes, and have ARA access to his machine. I have two modems because I haven't been able to set up ARA to receive calls and FAXes on the same modem.

The only other question I have is version numbers of software.

DISCUSSION ----------

Below are some test results we ran for setting up a PowerBook Duo and Duo Dock to achieve the functionality you desire:

- We tested with what we feel is the most straight-forward configuration when using two modems and it worked fine:

    Internal Express Modem for FAX
    External V.32 modem in Modem Port for ARA (data)
    Serially connected Printer in Printer Port

  We printed, connected with ARA, and then FAXed in what we had printed while ARA was still up. We feel that it would work fine with the modem and printer reversed in the ports, but that the standard (modem in modem, printer in printer) makes more sense.

  Setup:

    PowerBook Control Panel set to "External Modem"

```
Remote Access Control Panel setup:
     Modem in Modem Port
     Proper modem type selected in Modem Name (NOT Express Modem)
FAX Terminal application's Preferences set to answer
StyleWriter II set to Printer Port
```

- Another possibility is, since our Express Modem software works well with most third party modems, to set the Duo Dock up as:

```
Internal Express Modem for FAX
External ?? modem for ARA (data)
Serially connected Printer
```

  If the problem is the printer working out of the printer port, then the following should work:

```
Internal Express Modem for FAX
External ?? modem in Printer Port for ARA (data)
Serially connected Printer in Modem Port
```

- However, if the user expects heavy usage, we would recommend that they use the internal Express Modem for both the FAX and ARA features at the same time. A heavy load on the serial ports increases the risk of performance degradation and this risk is bypassed by the internal modem. In addition, the Express Modem will handle 9600 for the FAX transmission, and 14.4 for the data/ARA transmission, at the same time.

  We feel this solution of having one modem - the internal Express Modem - will handle everything you wish to do:

```
ARA in
ARA out -- with, or without, call back
FAX in
```

  We received a FAX, received an ARA connection, received another FAX and then made two ARA connections out to other ARA servers, all one right after the other. (This Duo had both the ARA Client and Server software installed.) We tested with a Duo 230 and the Duo was docked. All the desired functions worked well together.

Here is the list of the software releases we used:

```
System  7.1
System Enabler 201  v 1.0.1
ARA  v 1.0
FAX Terminal  v 1.2
FAX Extension  v 1.2
FAX Sender  v 1.2
FAX Viewer  v 1.3
Express Modem ( ARA CCL ) 1.0
  Note: All the Express Modem and FAX software came from the "Express
        Modem"  v 1.1.2 disk
```

Here is what the setup/configuration needs to be:

```
  Remote Access Setup:
       Answer = yes
       Modem  = Express Modem
       Port   = Internal
  FAX Terminal
       Preferences
           Set to "answer calls"
  PowerBook Control Panel
       Modem  = Internal
```

PageMaker 5.0: LW Driver 8.0 and Onyx/Zeal Bug (11/93)

Revised: 11/8/93
Security: Everyone

PageMaker 5.0: LW Driver 8.0 and Onyx/Zeal Bug (11/93)

==========

Article Created: 8 November 1993

TOPIC ----------

I'm having a problem with the following combination: Apple TrueType "Onyx" Font, PageMaker 5.0, and LaserWriter driver 8.0.

An "unimplemented trap" error occurs as soon as the print dialog box is opened and "Print" is selected. Printing from any other application such as MacWrite Pro and MS Word print fine with those fonts.

DISCUSSION ----------

This bug has been reported to Apple and Aldus engineering. Apparently, the problem occurs with the Zeal font as well.

Currently, there are a couple of workarounds to the problem:

- Printing with the Option key held down (bypassing the Aldus driver) will not cause the problem.

- A more permanent solution is to quit all applications, go to the Fonts folder, and drop the Onyx suitcase onto any other suitcase to merge it. Dropping another font suitcase onto the Onyx suitcase does not solve the problem, the Onyx suitcase must be merged into another.

This problem doesn't occur all the time, and varies with computer configurations. It seems to occur more with 040 machines than with 030 machines.

DISCUSSION ----------

Two Processors

Two microprocessors:

- 25-MHz Motorola 68LC040
- 25-MHz Intel 486SX

Because the processors work independently, you can run Macintosh and DOS (or Windows) applications simultaneously -- and copy and paste data between the two environments. MS-DOS version 6.2 is installed on the hard drive, along with the Macintosh operating system (system software version 7.1).

RAM and VRAM

- 8MB of RAM, expandable to 100MB
- 512K of VRAM, expandable to 1MB (Macintosh environment)
- 512K of RAM for video (DOS environment)

Flexible Display Options

You can switch instantly from the Macintosh environment to the DOS environment and vice versa on one display. Or you can add a second display to view both environments simultaneously.

- Features built-in support for one or two displays

- Works with all Apple displays as well as third-party NTSC, PAL, VGA, and SuperVGA displays (Macintosh environment)
- Works with Apple 13-inch, 14-inch, and 16-inch displays as well as third-party VGA and SuperVGA displays (DOS environment)

Expansion Capabilities

- Comes with eight built-in ports to support a wide range of peripherals
- Features an external PC game port
- Offers the option of an internal CD-ROM drive
- Includes on-board Ethernet (AAUI) (Macintosh environment)

Printing

DOS and Windows applications print to any Apple or other Macintosh-compatible printer through the built-in serial port or Ethernet port.

Centris 610 and Quadra 610 Upgrades

A DOS Compatibility Card for Macintosh allows upgrading Quadra 610 and Centris 610 computers to make their systems DOS- and Windows-compatible.

Order Numbers

- Macintosh Quadra 610 DOS Compatible
  M2322LL/A

- DOS Compatibility Card for Macintosh for Macintosh Centris or Quadra 610
  M2153LL/A

Quadra 840AV & 660AV, System 7 Pro, and AIR 3.0 (11/93)

Revised: 11/10/93
Security: Everyone

Quadra 840AV & 660AV, System 7 Pro, and AIR 3.0 (11/93)

==========

Article Created: 11 November 1993

TOPIC -----

Are there any compatibility issues for the Macintosh Quadra 840AV or Quadra 660AV computers, System 7 Pro, and Apple Internet Router 3.0?

DISCUSSION -----

System 7 Pro, the Macintosh Quadra 840AV or 660AV, and Apple Internet Router 3.0 are compatible with each other. The key is to install the software in the correct order. The problem here is the Apple Internet Router 3.0 installs a version of AppleTalk that is not compatible with System 7 Pro. The easiest way to solve the problem is to install the software in this order:

1) Install System 7 Pro
2) Install Apple Internet Router 3.0
3) Install NSI 1.4 or later

Step 3 insures that AppleTalk 58.1 or later is installed and this is what System 7 Pro requires.

Duo Type II Recharger: Marketing Number Correction (11/93)

Revised: 7/8/94
Security: Everyone

Duo Type II Recharger: Marketing Number Correction (11/93)

==========

Article Created: 11 November 1993

TOPIC ----------

I bought a PowerBook Duo Rechargeable Battery High Capacity Type II (M1835LL/A). It came with a slip of paper advising me to use "M1812" to charge the battery. I assumed this was a new battery recharger, but it's not in the product list.

DISCUSSION ----------

The marketing number M1812 is inaccurate. The correct number for the Type II Duo Battery Recharger is M4178LL/B (Service Part 922-0576).

Loading A/UX 3.0.1 On Quadra 610 and Quadra 650 (11/93)

Revised: 11/9/93
Security: Everyone

Loading A/UX 3.0.1 On Quadra 610 and Quadra 650 (11/93)

==========

Article Created: 8 November 1993

TOPIC ----------

I need the installer disk for the Quadra 610 and Quadra 650 not the Centris computers. Because of the version difference in the enablers of both Quadra 610, 650 and Centris 610, 650, I cannot boot the Quadra 610, 650 from the current A/UX Installation disk.

DISCUSSION ----------

The Quadra 610 and Quadra 650 were anticipated in 3.0.1, so the kernel recognizes their machine ids, but the installation floppy did not contain the necessary enabler. Keep in mind that A/UX will not work with 68LC040-based Quadra 610 computers. The low-end Quadra 610 (8/160) has the 68LC040.

Here's how to get A/UX running on a Quadra 610 and Quadra 650:

1) Make a copy of the A/UX install boot floppy.
2) Put the enabler for the Quadra 610 and Quadra 650 on the new install floppy.
3) Boot up and install normally.
4) Boot off a boot floppy or boot CD. Install the Quadra 610 and Quadra 650 enabler on the A/UX boot partition.

Things should now work fine. The only glitch is that the A/UX Finder won't give the correct name for your computer in "About This Macintosh" since their final names were not available when A/UX 3.0.1 came out.

AWS 95: NFS File Copy and Slow Finder Visibility (11/93)

Revised: 11/9/93
Security: Everyone

AWS 95: NFS File Copy and Slow Finder Visibility (11/93)

==========

Article Created: 8 November 1993

TOPIC --

I'm using NFS between a SGI UNIX computer and an Apple Workgroup Server (AWS) 95.

The volume is exported from the AWS 95, and mounted on the SGI. I copy files from the SGI onto the mounted volume, 6 at a time. The desktop on the AWS 95 doesn't get refreshed for an hour, so the files aren't visible until then. The copied files can be found with Find, or are visible in the command shell, but I want to know why the refresh takes so long. Is there anything that can be done to speed this up? The time it takes increases with the number of people attached.

DISCUSSION ---

There is no good way to correct this situation. We recommend that NFS volumes be kept separate from volumes used for AppleShare for this very reason. The changes made by an NFS client are done behind the Finder's back and require the folder be closed and reopened before the changes will be reflected on the server and then the client. The problem is that there are 3 different caches involved that store information on files and there locations.

A workaround is to turn off the AppleShare Pro Folder Cache. With the Folder cache off, the folders on the server and the clients will sync up within 90 seconds. It is not necessary to do any window manipulation on the server or the clients.

At Ease: PowerTalk Incompatibility (8/95)

Revised: 8/14/95
Security: Everyone

At Ease: PowerTalk Incompatibility (8/95)

==========

Article Created: 2 November 1993
Article Reviewed/Updated: 14 August 1995

TOPIC -----

On a PowerMacintosh, if a user switches from At Ease into the Finder, uses a PowerTalk mailbox, and then switches back to At Ease, the CPU may crash.

DISCUSSION -----

An incompatibility has been found between At Ease 2.0.x and PowerTalk. Engineering is aware of the problem, and is working on a solution. Apple is not recommending that PowerTalk and At Ease be used together.

For those users who require this solution, the workaround is to restart the computer rather than returning to At Ease after using PowerTalk mail.

PostScript Level 2: Benefits (11/93)

Revised: 11/10/93
Security: Everyone

PostScript Level 2: Benefits (11/93)

==========

Article Created: 10 November 1993

TOPIC ----------

What are the benefits of PostScript Level 2?

DISCUSSION ----------

To get more in-depth information on the what PostScript Level 2 provides over PostScript Level 1, Apple would suggest referring to the "PostScript Language Reference Manual, Second Edition" by Adobe Systems Incorporated (Addison Wesley). We have taken excerpts and/or paraphrased an overview of PostScript Level 2 features outlined in the reference manual, chapter 1, pages 7-9.

Here is a list of the new language features of PostScript Level 2, which include previous language extension features:

- Dictionaries
  Many Level 2 operators expect a dictionary operand. This allows for optional parameters and future extensibility.

- Memory Management
  In general, memory is more efficiently shared among different uses and arbitrary memory restrictions have been eliminated.

- Resources
  The language includes convenient facilities for locating and managing resources.

- Filters
  The language supports filters for ASCII encoding of binary data, compression and decompression, and embedded subfiles.

- Binary Encoding

In addition to the standard ASCII encoding, the language syntax includes two binary-encoded representations.

- User Paths
  User path operators perform path construction and painting as a single operation for convenience and efficiency. There is also a user path cache and some convenience operators for painting rectangles.

- Forms
  There is a form cache to optimize repeated uses of the same form.

- Color Spaces
  Colors can be specified according to a variety of color systems (that is, gray scale, RGB, CMYK, and CIE based). The color space is now an explicit parameter of the graphics state.

- CIE-based color spaces
  The language supports several device-independent color spaces based on the CIE 1931 (XYZ)-space.

- Patterns
  It is possible to paint with patterns as well as with solid colors. There is a pattern cache to optimize repeated uses of the same pattern.

- Images
  There are several enhancements to the facilities for painting sampled images: use of any color space, 12-bit component values, direct use of files as data sources, and additional decoding and rendering options.

- Other text and graphic operators
  There are several other new operators optimized for performance: graphic state objects, automatic stroke adjustment, new variants of "show", and a new "selectfont" operator.

- Device Setup
  The setpagedevice operator provides a device-independent framework for specifying the requirements of a page description and for controlling both standard and optional features of a device.

- Interpreter Parameters
  Administrative operations such as system configuration and changing input-output device parameters are now organized in a more systematic way.

HP Emulation: Setting Lines Per Page and Lines Per Inch 11/93

Revised: 11/10/93
Security: Everyone

HP Emulation: Setting Lines Per Page and Lines Per Inch 11/93

==========

Article Cerated: 11 November 1993

TOPIC ----------

Can the number of lines per inch and lines per page be set when using the LaserJet emulation mode on LaserWriter printers?

DISCUSSION ----------

The number of lines per inch and lines per page can be configured using the standard PCL escape code sequences. The value can be changed from within the HP emulation mode using the following PCL escape code sequence:

<ESC>&l#e##F

Where:

l is a lower case L
is the top margin
is the page length (default is 60)

In addition, the following escape sequence can be used to set the number of lines per inch, allowing more lines per page by decreasing the empty space between each line.

<esc>&l#D

Where:

l is a lower case L
is the number of lines per inch (default is 6)

There are several methods for downloading the information to the printer. From a standard PC that has BASIC available the following program will work. Be sure to replace the # and ## with the desired option values.

Program for setting the lines per page

```
10 REM This program allows the number of lines per page 20 REM to be
set while in the LaserJet emulation mode. 30 REM Replace the # with
the desired top margin. (1 is the 40 REM minimum recommended value to
avoid losing lines off

50 REM the top of the page) 55 REM Replace the ## with the desired
number of lines per page. 60 LPRINT CHR$(27)"&l#e##F"
```

Program for setting the lines per inch

```
70 REM This program allows the number of lines per inch 80 REM to be
set while in the LaserJet emulation mode. 90 REM Replace the # with
the desired number of lines per inch. 100 REM The default value is 6.
Options are 1,2,3,4,6,8,12,18,24,48. 110 LPRINT CHR$(27)"&l#eD"
```

Macintosh 21-inch Display: Image Shaking (11/93)

Revised: 11/10/93
Security: Everyone

Macintosh 21-inch Display: Image Shaking (11/93)

==========

Article Created: 10 November 1993

TOPIC ----------

I have a Macintosh 21-inch Display near some florescent lights and it causes the image on my monitor to shake and jump. I cannot move the monitor any further away from the lights. Is there any magnetic shield or anything else that can be used to prevent the image from shaking so violently?

DISCUSSION ----------

There is no practical method of shielding the monitor from this type of external interference. However, since you have localized the problem to fluorescent lighting fixtures, a solution to your problem should not be difficult.

A fluorescent fixture that is functioning correctly should not interfere with a monitor's operation. It is not uncommon for these lamps to arc internally. In many cases this action is readily apparent because the lamps have a discernible flicker. In most cases, the internal arcing does not affect the light output of the lamp. The best way to isolate a defective lamp is by disconnecting one lamp at a time until the symptom disappears or becomes less severe. When following this procedure be aware that the problem may involve more than one lamp. If the lamps check good but the symptom persists, the problem is associated with one of the ballasts that drives the lamps. The defective ballast should be replaced.

The reason that fluorescent fixtures interfere with monitor performance is due to the monitor's refresh rate. Because the lamps tend to arc at a 60 hz rate (because they are driven from a 60 hz power source--the wall outlet), they transmit noise at this rate. Therefore, if the monitor does not operate at the identical 60 hz refresh rate (our monitors usually operate at a higher rate), it interprets these pulses as synchronizing signals which causes the

display to jitter.

MacX, AppleTalk-DECnet Over ARA and Zone Problem (11/93)

Revised: 11/10/93
Security: Everyone

MacX, AppleTalk-DECnet Over ARA and Zone Problem (11/93)

==========

Article Created: 9 November 1993

TOPIC ----------

I'm interested in doing DECWindows emulation with MacX 1.2 in a PowerBook 180c running System 7.1, connected to a VAX (VMS 5.5 with PATHWORKS for Macintosh v1.1) through AppleTalk Remote Access (ARA). The problem arises when trying to connect by using the following Host definition in the XWindown command:

  Tool: AppleTalk-DECnet Tool v1.1
  Gateway: DECnet on VMAD01 (VMAD01 is the DECnet name for the MicroVAX)
  Service: VMAD01 (we want to connect to this node)
  ADSP entity (as seen in the tool dialog): Kiko:X11@SPA Servidores

When the command is started the msax$client DECnet object starts and fails in finding back the PowerBook 180c node. The reason is that the string arriving at the VAX with the ADSP node address is "Kiko:X11@*" as I can see in the netserver.log file which is shown below:

```
$ ! Copyright (c) 1987 Digital Equipment Corporation. All rights reserved.
$ IF "" .NES. "" THEN NETSERVER$COMMAND
$ IF ""  .EQS. "" THEN NETSERVER$VERIFY = 0
$ V = F$VERIFY(NETSERVER$VERIFY)

        ------------------------------------------------------

        Connect request received at 20-SEP-1993 16:01:17.37
            from remote process VMAD01::"0=ATKGW$USER"
            for object "SYS$SYSTEM:MSAX$CLIENT.COM"

        ------------------------------------------------------

        ------------------------------------------
        PID=00000274    20-SEP-1993 16:01:18.24
        Remote=Kiko:X11@*       Local=VMAD01
```

```
        Create Display  Node:      Kiko:X11@*
                        Transport: ADSP
                        Server:    0
                        Screen:    0
        ------------------------------------------

%MSAX-F-NAMLOOKUPERR, error looking up name "Kiko:X11@*"
-ATK-E-NBP_NAMNOTFOU, Name was not found
X Toolkit Error: Can't Open display
%DWT-F-DWTABORT, xtoolkit fatal error
%MSAX-E-DCL_FAILURE, SET_DISPLAY_SUB DCL Subroutine failure
$ SET DISPLAY   /CREATE -
                /NODE =         "Kiko:X11@*" -
                /TRANSPORT =    "ADSP" -
                /SERVER =       "0" -
                /SCREEN =       "0" -
                /SUPER
$ RUN SYS$SYSTEM:MSAX$VERIFY
%MSAX-F-NAMLOOKUPERR, error looking up name "Kiko:X11@*"
-ATK-E-NBP_NAMNOTFOU, Name was not found
%DWT-F-DWTABORT, xtoolkit fatal error
        ------------------------------------------
        PID=00000274    20-SEP-1993 16:01:29.81
        Remote=Kiko:X11@*       Local=VMAD01
        Logout - not caching this networked process
        ------------------------------------------
```

Obviously if the ARA server and the VAX are not in the same AppleTalk zone, therefore the node Kiko:X11@* cannot be reached by the VAX.

I have checked by selecting the "Remote Only" icon in the network control panel and I have the same problem.

On the other hand if MacX 1.2 is open, and by using terminal emulation I do the following in the MicroVAX:

```
 $SET DISPLAY/CREATE/USER/TRANSPORT="ADSP"/NODE="Kiko:X11@SPA Servidores"
 $RUN SYS$SYSTEM:VUE$MASTER
```

a new XWindow client opens in the Macintosh, which means that everything is working from the connectivity point of view.

Am I doing something wrong? Is this a known bug of MacX 1.2 or the AppleTalk DECnet Tool? Is there any work around for this problem?

DISCUSSION ----------

We have duplicated the problem and Digital has confirmed it. When the ARA Server and the VAX are NOT in the same zone, the VAX looks for the remote Macintosh in the VAX's zone, instead of the ARA server zone. Digital will add this to the bug database to be fixed in the next release of the AppleTalk-DECnet Tool.

The workaround is to put the VAX and the ARA server in the same zone.

Performa 550: Screen Turns Off (11/93)

Revised: 11/10/93
Security: Everyone

Performa 550: Screen Turns Off (11/93)

==========

Article Created: 10 November 1993

TOPIC----------

Performa retailers are reporting that the Performa 550 screen will turn off while running the In-Store demo.

DISCUSSION----------

The Performa 550 is Energy Star compliant, which turns off the screen after a few minutes. For example, if you choose 15 minutes, the screen will darken after the computer has been inactive for 15 minutes.

Workaround: Turn off the energy saving features by:

- Choosing the Control Panels from the Apple Menu.
- Open the Screen control panel.
- Turn off the Screen Power Saver.

LaserWriter Select 360 for Windows: Specifications (11/93)

Revised: 11/10/93
Security: Everyone

LaserWriter Select 360 for Windows: Specifications (11/93)

==========

Article Created: 10 November 1993

Topic ----------

This article gives the technical specifications for the LaserWriter Select 360 for Windows.

Discussion ----------

Marking Engine

• Fuji Xerox laser-xerographic

Print Quality

• PostScript: 300 or 600 dots per inch, selectable
• LaserJet IIIP (PCL 5) Emulation

Printer Memory

• 7 MB of RAM Standard, upgradable to 16 MB
• 4 MB of ROM

Printer Fonts

• 64 Fonts Are Provided, Including Such Fonts As ITC Avant Garde®, ITC Bookman®, Chicago, Courier, Delphian, Garamond Condensed, Geneva, Helvetica, Helvetica Black, Helvetica Narrow, Lubalin Graph, Lucinda Bright, Machine, Monaco, Nadianne, New Century Schoolbook, New York, Old English Text, Onyx, Oxford, Palatino®, Swing, Symbol, Times, ITC Zapf Chancery®, ITC Zapf Dingbats®, And Zeal.

• 40 additional TrueType fonts on disk from the Bitstream TrueType Font Pack

Laser

• Type: semiconductor laser
• Wavelength: 780 nanometers
• Output Power: 5 milliwatts maximum

Speed

• 10 pages per minute maximum. Actual speed depends on the images printed and the computer used.

Interfaces

• Simultaneous connection to parallel, LocalTalk and RS-232 serial interfaces

Recommended Duty Cycle

• Minimum life expectancy is 300,000 pages, with no monthly page limit

Paper Feed

• Automatic feed from paper cassettes and multipurpose tray; manual feed for single sheets

Energy Star

• The LaserWriter Select 360 for Windows is EPA Energy Star-compliant

Printing Materials

• Media: 20 to 24-lb. from 250-sheet feeder, up to 32-lb. from 50-sheet multipurpose tray

Paper Capacity

• Standard Cassette: Holds up to 250 sheets of U.S. Letter, A4, or B5 paper Sizes.
• Multipurpose Tray: Holds up to 50 sheets of U.S.legal, A4, U.S. letter B5, or executive paper, or 5 envelopes.
• Envelope Cassette: Holds up to 30 Com-10, Monarch, Dl, or C5 envelopes.
• Optional Cassettes are available for 250 sheets of U.S. legal paper and 500 sheets of U.S. Letter or A4 paper.

Imageable Area

• Maximum printable line: 8.1 inches (207.7 mm)
• Minimum top and bottom margins: .18 inches (4.5 mm)
• Minimum left and right margins: 18 inches (4.5 mm)

Actual imageable area may vary depending on the application program. The printer senses cassette size and adjusts to maintain these margins.

Dimensions

• Height: 8.0 inches (25.8 Cm)
• Width: 15 inches (38 Cm)
• Depth: 18.3 inches (45.8 Cm)

Weight

• 26 pounds

Acoustic noise levels (bystander position)

• Standby: 36dBA
• Printing: 47 dBA

Operating Environment:
Humidity

• 20 To 80 percent, noncondensing

Toner cartridge transit environment

• -4° to 104° F (-20° to +40° C)

Input Electrical Requirements:
U.S./Japan

• 100-115 V (± 10%), 50-60 Hz (±2 Hz)

Europe/Australia

• 220-240 V (±10%), 50 Hz (±2 Hz)

Power Consumption:
Operating

• 450 W maximum at 115 V or 220 V

Ozone Emission:
• 0.05 parts per million maximum, measured in accordance with ECMA 129 of UL114 standards for ozone measurement

Ordering Information

LaserWriter Select 360 for Windows
Order No. M2729LL/A
- Apple LaserWriter Select 360 for Windows
- Toner sold separately
- Installation software and fonts disks
- Complete setup, learning, and reference documentation

- Limited warranty

LaserWriter 360 Toner cartridge
Order No. M1960G/A

LaserWriter 360 PostScript Fax Card
Order No. M2345LL/A

- Fax software for Windows, MS-DOS, and Macintosh systems
- RJ-11 phone connector standard
- Supports PostScript language and Group 3 standards

Apple LaserWriter Select 250-Sheet Feeder/Cassette
(supports A4, U.S. letter, A5, and executive paper sizes)
Order No. M2041G/A

Apple LaserWriter Select 500-Sheet Feeder/Cassette
(supports A4 and U.S. letter paper sizes)
Order No. M2042G/A

Apple LaserWriter Select 250-Sheet Letter Cassette
Order No. M2034G/A

Apple LaserWriter Select Envelope Cassette
(holds 30 envelopes)
Order No. M2031G/A

Apple LaserWriter Select Legal Cassette
(holds 250 sheets)
Order No. M2032G/A

Quadra 605 & LC 475: 8MB SIMMs Are Supported (11/93)

Revised: 11/11/93
Security: Everyone

Quadra 605 & LC 475: 8MB SIMMs Are Supported (11/93)

==========

Article Created: 10 November 1993

TOPIC ----------

Can I use 8MB DRAM SIMMs in a Macintosh LC 475 or Quadra 605? Some Apple documentation omits the 8MB SIMM as a supported size, and I've heard of systems that didn't work after 8MB SIMMs were installed.

DISCUSSION ----------

Yes, 8MB SIMMs are supported by the Macintosh LC 475 and Quadra 605.

4MB of 80ns DRAM is soldered on board, and one 72-pin RAM SIMM socket is available for expansion. The sockets can accommodate both single- and double-sided SIMMs. Each single-sided SIMM can hold 1MB, 4MB, or 16MB using 1-, 4-, or 16-Mbit DRAM technology, respectively. Each double-sided SIMM holds twice that amount of memory.

Because the DRAM SIMM in the Quadra 605 and the LC 475 sits at a severe angle in the SIMM socket, there may be an interference problem with some third-party double-sided SIMMs. With the Quadra 605 and LC 475, there is minimal clearance between some of the components on the main logic board and the SIMM. You may also encounter interference with third-party SIMMs that have ICs placed too close to the edge of the PCB.

Remember, although several vendors make composite SIMMs that may work with your particular computer and application, Apple does not support composite SIMMs in any Macintosh. And 100ns SIMMs do not work in these Macintosh models: SIMMs must be have an access time of 80ns or better.

Before purchasing any third-party SIMMs, verify with the manufacturer that the SIMMs conform to Apple's specifications for your specific Macintosh product.

Elographics Intellitouch: Macintosh AV Compatibility (11/93)

Revised: 11/11/93
Security: Everyone

Elographics Intellitouch: Macintosh AV Compatibility (11/93)

==========

Article Created: 11 November 1993

TOPIC ----------

Is Elographics' Intellitouch screen compatible with the Quadra 840AV? I've used this product successfully with a Quadra 700, but when I try it with a Quadra 840AV, the touch-screen function couldn't be activated.

DISCUSSION ----------

Elographics provides the following information:

- Their original software does not work with Macintosh AV systems.
- Contact Elographics for the new "MonitorMouse for Macintosh, version 2.0", which is AV-compatible.

MacTCP: More Than One IP Gateway and AppleTalk Zones (11/93)

Revised: 11/11/93
Security: Everyone

MacTCP: More Than One IP Gateway and AppleTalk Zones (11/93)

==========

Article Created: 10 November 1993

TOPIC ----------

Is there any reason why a network administrator couldn't have more than one IP gateway in a given AppleTalk zone? Are the existence of AppleTalk zones even an issue? I want to serve more than the 64 dynamic IP addresses my gateway allows to Macintosh clients on the network segment. I propose to do this by establishing two gateways each serving 64 addresses from different ranges. What is the limitation of MacTCP on a given zone for Dynamic addressing? Is there any? If so, does it differ by version of MacTCP?

DISCUSSION ----------

There is a limit of 1 DDP/IP gateway per zone. All versions of MacTCP have the same limit, it's not really a limitation of MacTCP as much as it is of the DDP/IP gateway. It's fairly involved but the bottom line is that the DDP/IP gateway specification is not clearly defined and currently offers no way to arbitrate requests from multiple gateways located in the same zone.

There are answers however, you could use a DDP/IP gateway that offers more than 64 addresses such as a cisco router. The cisco imposes no limits on the number of addresses you can configure other than those imposed by the amount of physical RAM you have to accommodate the table. The other solution for gateways with limited addresses would be to configure multiple zones on the same cable (ddpip1, ddpip2, ddpip3, etc.) and place one gateway in each zone. You could arbitrate which users used which gateways or you could just tell them to use one of the gateways in any of the ddpip zones. If one gateway was unable to give the Macintosh an address the user could simply choose the next zone until they were able to get an IP address.

PostScript: Printing Process (11/93)

Revised: 11/11/93
Security: Everyone

PostScript: Printing Process (11/93)

==========

Article Created: 11 November 1993

TOPIC ----------

Are there any documents that explain the printing process in detail? What is going on inside the Macintosh from the moment the print command is initiated until the page comes out of the printer?

Also, does the type of Macintosh one uses plays a big role in printing speed?

DISCUSSION ----------

With regard to the questions on the printing process and varying print speed from different Macintoshes, there is no single document we are aware of that goes into detail about this.

To start off, here is a brief outline of the printing process.

1. User selects Print from the File menu.

2. The LaserWriter driver then utilizes QuickDraw bottleneck procedures to transform the QuickDraw screen image into PostScript commands.

3. If background printing is selected, then the resulting PostScript output is spooled to disk, and PrintMonitor is launched in the background to communicate with the printer.

4. PrintMonitor makes a connection with the printer and sends the PostScript file to the LaserWriter. PrintMonitor is actually making calls to the AppleTalk stack to open the PAP connection and "packetize" the PostScript file.

5. The PostScript interpreter in the LaserWriter then takes the PostScript input stream and renders the resulting image on paper.

In terms of how different computers affect printing speed, you can refer to the outline above to realize where a faster computer might have an advantage. To summarize, speed gains can be achieved in the overall "processing of data" before it gets to the printer:

- faster conversion from QuickDraw to PostScript.
- faster spooling the PostScript file to disk.
- larger number of processor time-slices to PrintMonitor due to finishing tasks faster.
- faster "packetizing" of the data by the AppleTalk stack.
- if Ethernet is being used, built-in Ethernet (as in the Quadra) will be faster than Nubus Ethernet cards.

Thus, what you are seeing in terms of increased speed with a Macintosh Quadra, as opposed to a Macintosh IIcx, is expected.

LaserWriter Pro 810 for Windows: Specifications (11/93)

Revised: 11/11/93
Security: Everyone

LaserWriter Pro 810 for Windows: Specifications (11/93)

==========

Article Created: 11 November 1993

TOPIC ----------

This article gives the specifications for the LaserWriter Pro 810 for Windows printer.

DISCUSSION ----------

Print engine

- Fuji Xerox XP 20

Print quality

- 800-, 600-, 400-, and 300-dot-per-inch (user selectable) available in PostScript mode; 300-dot-per-inch available in PCL mode

Print speed

- Up to 20 pages per minute (varies with image complexity)

Controller

- Weitek 8200 RISC processor

Ports

- Serial, LocalTalk, and Ethernet ports
- External SCSI port

Memory

- 8MB standard; expandable to 32 via 4MB and 8MB Expansion Kits
- 8MB required for 800-dpi letter size
- 12MB required for 800-dpi legal size

- 16MB required for 800-dpi tabloid size

Fonts

- 64 TrueType fonts on disks from the following font families: ITC Avant Garde, ITC Bookman, Chicago, Courier, Delphian, Garamond Narrow, Geneva, Helvetica, Helvetica Narrow, Lubalin Graph, Lucida Bright, ITC Machine, Nadianne, Monaco, New Century Schoolbook, New York, Old English Text, Onyx, Palatino, Swing Bold, Symbol, Times, ITC Zapf Chancery, ITC Zapf Dingbats, and Zeal

- 40 additional fonts on disk from the Bitstream TrueType Font Pack, including fonts from the following families: Bitstream Oz Handicraft, Clarendon, English, Fraktur, Freehand, Geometric, Humanist, Huxley Vertical, Imperial, Impress, Incised, Informal, Nuptial, Poster Bodoni, Revival, Square Slabserif, Staccato, Umbra, and Vineta

- 35 PostScript Type 1 fonts
- 32 fonts in PCL mode
- Any TrueType or PostScript font

Drivers

- Windows, MS-DOS, and Macintosh

Page description languages

- PostScript Level 2
- PCL 4+
- Auto-emulation switching provided through Virtual Printer Technology

Recommended duty cycle

- Minimum life expectancy: 600,000 pages
- Toner cartridge: 11,000 pages at 5% density

Print materials

- #10 business envelopes (9.5" x 4.25")
- Most standard labels
- Paper sizes: U.S. letter, U.S. legal, tabloid, A3, A4, A5, B4, B5, folio, and executive
- Most letterhead and colored stock
- Medium-weight photocopier transparencies

Paper handling

- Three universal cassettes standard: each holds 250 sheets and supports letter, legal, and tabloid paper sizes
- Optional cassettes: executive and folio
- Optional automated media feeder

Output tray

- 250-sheet face-down stacker

Network management

- Supports SNMP, allowing the printer to be recognized as a network element and managed by system administrators
- Features Remote Console Facility (RCF), allowing network managers in TCP/IP, NetWare, and LAT environments to recognize, diagnose, and manage the printer

Internal Adobe PostScript fax cartridge option

- Send and receive capabilities
- Adobe PostScript fax compatible
- Group 3 fax compatible
- Prints up to 800 dpi PostScript faxes on plain paper

Electrical requirements

- U.S./Japan: 100 to 115 V, 50 to 60 Hz
- Europe/Australia: 220 to 240 V, 50 Hz

Power consumption

- 850 W maximum at 115 or 220 V

Environmental requirements

- Operating temperature: 60° to 90° F (15° to 32° C)
- Relative humidity: 20% to 80% noncondensing
- Toner cartridge transit environment: –4° to 104° F (–20° to 40° C)

Size and weight

- Height: 19.5 in. (49.5 cm)
- Width: 20.5 in. (52.0 cm)
- Depth: 21.5 in. (54.6 cm)
- Weight: 81 lbs (37 kg)

Ordering Information

LaserWriter Pro 810 for Windows: Description (11/93)

Revised: 11/11/93
Security: Everyone

LaserWriter Pro 810 for Windows: Description (11/93)

==========

Article Created: 11 November 1993

TOPIC ----------

This article describes the LaserWriter Pro 810 for Windows printer.

DISCUSSION ----------

The Apple LaserWriter Pro 810 for Windows is the ideal high-performance printing solution for large workgroups. It delivers exceptional print quality and speed, comes with extensive paper-handling options, and provides the networking flexibility required for enterprise-wide computing environments. In addition, with the optional PostScript Fax cartridge, everyone on the network can use the LaserWriter Pro 810 to send faxes to any PostScript or standard Group 3 fax machine and know they'll arrive looking their best.

The LaserWriter Pro 810 for Windows is well equipped to handle the printing needs of the most demanding environments. Not only does it print camera-ready text and graphics at up to 800-dot-per-inch resolution, it's also one of the fastest laser printers available, printing up to 20 pages per minute. And dozens of scalable fonts that come with the printer make it easy for users to print documents in many different styles and sizes.

Another important advantage of the LaserWriter Pro 810 for Windows is its ability to print documents generated by many different types of computers, including those running MS-DOS, Windows, Macintosh, or UNIX operating systems. Built-in Ethernet, serial, and LocalTalk ports stay active, so users can simultaneously send documents to the printer without having to change settings. And with a built-in network card, the printer can communicate on Ethernet networks utilizing multiple concurrent protocols, including TCP/IP, NetWare IPX, and Digital LAT.

For flexibility in paper handling, the LaserWriter Pro 810 comes with three cassettes that support up to 750 sheets of paper as large as 11 by 17 inches. In addition, optional cassettes are available for special paper

sizes and thicknesses.

The LaserWriter Pro 810 for Windows supports PCL 4+ for MS-DOS application compatibility, as well as PostScript Level 2. PostScript Level 2 offers improved performance, memory management, and pattern caching. Using its Virtual Printer Technology, the LaserWriter Pro 810 automatically switches between PCL and the PostScript language, so users never need to worry about changing settings or dip switches.

With a rated duty cycle of 600,000 pages, the LaserWriter Pro 810 for Windows can handle the most demanding challenges—today and well into the future.

FEATURES

Print quality

- 800, 600, 400 (default), or 300 dpi; user selectable
- 35 scalable PostScript fonts, 32 PCL fonts, and 104 TrueType fonts

Performance

- Up to 20-page-per-minute print speed
- Weitek 8200 RISC processor

Connectivity

- Ethernet and serial ports for plug-and-play compatibility with MS-DOS and Windows computers
- Built-in Ethernet support for NetWare IPX, TCP/IP, EtherTalk, and Digital LAT protocols
- Automatic switching between PCL emulation and PostScript Level 2
- Support for twisted-pair or thin-wire Ethernet transceiver configurations
- SCSI port for hard disk font storage

Optional PostScript fax capability

- Optional PostScript Fax Cartridge for adding plain-paper fax capability to the printer
- Allows all users on the network to send and receive faxes at up to 800 dpi

Paper handling

- Three paper trays support multiple paper sizes
- Printing on envelopes, labels, transparencies, letterhead, and paper up to 11 by 17 inches
- Maximum capacity: 750 sheets

Memory

- 8MB standard; expandable to 32 via 4MB and 8MB Expansion Kits

- 8MB required for 800-dpi letter size
- 12MB required for 800-dpi legal size
- 16MB required for 800-dpi tabloid size

PowerBook 200 Series: Symptoms of Bent Magnesium Frame (8/94)

Revised: 8/31/94
Security: Everyone

PowerBook 200 Series: Symptoms of Bent Magnesium Frame (8/94)

==========

Article Created: 11 November 1993
Article Reviewed/Updated: 31 August 1994

TOPIC ----------

The PowerBook Duo 210, Duo 230, Duo 250, Duo 270c, 280, and 280c have a lightweight magnesium inner subframe, also known as CPU stiffener. This article describes some problems that may result from a bent magnesium frame.

DISCUSSION ----------

- Docking problem. If one particular Duo fails to properly interface with a docking device, where other Duos work fine, the one Duo's frame may be bent slightly.

- Battery seating. If the Duo's battery requires frequent reseating, and the power manager requires frequent resets, the frame may not be holding the battery tight against the logic board contacts.

- Duo won't run on battery power. If a logic board replacement temporarily corrects the problem, but needs repeated repair, the magnesium frame may be shorting against the logic board. If the Duo fails to start up on a charged battery, it may be a failed logic board caused by a shorting magnesium frame.

If you encounter any of these conditions, and you feel the problem is intermittent, the problem may be caused by a bent magnesium frame. Consider this component when dispatching. Obviously the magnesium frame won't always need replacement -- but a repeat failure for the same symptom may be a clue.

Article Change History:
31 Aug 1994 - Added new models, changed name of magnesium frame to reflect actual service name of part.

PowerBook Duo Batteries: Compatibility and Installation (8/95)

Revised: 8/29/95
Security: Everyone

PowerBook Duo Batteries: Compatibility and Installation (8/95)

==========

Article Created: 11 November 1993
Article Reviewed/Updated: 13 December 1994

TOPIC

Are the Type II and Type III PowerBook Duo batteries compatible with all Duo computers? Can I use the battery conditioning software on all PowerBook Duo computers?

DISCUSSION

The Type II and Type III batteries can be used on all PowerBook Duo computers when the appropriate software has been installed. The Battery Reconditioning software can only be used on the PowerBook 270c, 280, and 280c.

The Type II battery is no longer available as a separate part. With a Type III Duo Battery, part number M2780LL/A, you receive:

* Type III battery
* PowerBook Duo Enabler 2.0
* Battery case

Installation for Type II Batteries

Installation of the Type II battery and software on a Duo running System 7.1 or System 7 Pro requires a fresh install of system software utilizing the diskettes that came with the Type II battery.

Below are the directions for those versions of system software.

- For System 7.1, follow the "clean install" instructions (search on "Clean Install" to find instructions). Substitute the Install Me First diskette that came with the battery for the one with System 7.1. If the diskettes are not available, as a temporary measure, follow the steps below for System 7 Pro.

- For System 7 Pro, copy the new enabler, the new control panels, (PowerBook Display, PowerBook, PowerBook Setup, and AutoRemounter) from the Install Me First diskette to your System folder. Copy the additional files from the Extras disk (Network Control Panel, A/Rose, EtherTalk Phase 2, EtherTalk Prep and New Network Resources) to your System Folder as well, and restart.

- System 7.5 has the software built in so no additional software is necessary.

Installation for Type III Batteries

With the exception of System 7.5 which has the software built in, to utilize the Type III battery, you need only install the new Enabler in your system folder. After restarting the Duo, the installation process is complete.

Power Adapter and Recharger Information

Type I, II, and III Duo batteries can be recharged in the recharger model M1812 (Marketing number M4178LL/B). The Type I recharger, model M7778, only supports Type I batteries. Contact Apple or an Apple authorized reseller to obtain the correct model. The model number of the recharger is printed on the bottom of it.

If a red light appears when you place a Type III battery into your recharger, the recharger is either the older model or it needs to be updated.

If you have a recharger model M1812 and you need to update it, follow these steps:

Step 1
Shut down the PowerBook Duo computer, make sure the Type III battery and any necessary software has been installed. If you're running System 7.5.1 the Type III Battery extension must be installed.

Step 2
Plug the power adapter into an AC outlet using the power cord that came with the computer.

Step 3
Snap the recharger onto the side of the power adapter.

Step 4
Plug the power adapter cable into the power adapter port on the back of the Duo computer.

Step 5
Turn on the PowerBook Duo to download the update to the charger.

Article Change History:
29 Aug 1995 - Reviewed for technical accuracy.

13 Dec 1994 - Added info on Type III battery and software, and System 7.5.
04 Mar 1994 - Noted Battery reconditioning applies only to 270c.

DAL for VAX/VMS 1.4: TCP/IP Support (11/93)

Revised: 11/12/93
Security: Everyone

DAL for VAX/VMS 1.4: TCP/IP Support (11/93)

==========

Article Created: 11 November 1993

TOPIC ----------

What is the status of TCP/IP access to DAL on VMS? Is this a feature of the latest release, or is it due for the next release of DAL?

DISCUSSION ----------

The latest version of DAL for VAX/VMS 1.4 supports the following TCP products:

Digital's TCP/IP Services for OpenVMS V2.0
Process Software's TCPware V3.1
TGV's Multinet V3.2
Wollongong's WIN/TCP V5.2.1

To locate a vendor's address and phone number, use the vendor name as a search string.

Palatino Fonts: Not Displaying Bold 11/93

Revised: 3/16/94
Security: Everyone

Palatino Fonts: Not Displaying Bold 11/93

==========

Article Created: 12 November 1993

TOPIC -----

The screen representation of Palatino Bold (for odd sizes) doesn't appear in Bold on the screen (TrueType). For example, Palatino 11 point Bold, is not appearing bold on the screen.

DISCUSSION -----

The behavior you describe only occurs when the TrueType Palatino is installed. The reason this happens is fairly straightforward. One of the main features of TrueType is to provide an "as readable as possible" screen representation of a font, in the size selected.

In some cases, TrueType will decide that it is not possible to bold a font and still have it be readable. This is the case with Palatino. However, this particular trait does not always appear to be logical. For example, Palatino 4 can be bold on the screen and it is certainly not readable.

In any case, selecting to bold Palatino will change the spacing of the font to preserve the margins for the document.

There is no way to change this behavior.

LaserWriter Select 360: PCL emulation (11/93)

Revised: 11/12/93
Security: Everyone

LaserWriter Select 360: PCL emulation (11/93)

==========

Article Created: 12 November 1993

TOPIC -----

The LaserWriter Select 360 supports HP PCL5 emulation. Which of the printer's ROM fonts are directly accessable via PCL5?

DISCUSSION -----

As it turns out, not all fonts in the LaserWriter Select 360's ROM are accessible while in LaserJet III PCL5 emulation mode. There are only four fonts available, two are bitmap fonts (with a couple fixed-pitch point sizes), and the other two are scalable fonts. The fonts are:

Bitmap fonts (fixed pitch)

Courier
Line Printer

Scalable fonts

Times
Univers

Information regarding these fonts is actually built into the ROMs of the LaserWriter Select 360. The information provided includes such things as available point sizes, pitches, styles, and the PCL5 escape sequence necessary to access the font. To get a printout of this information, just download the following two lines of PostScript:

```
/LaserJetIII  /ProcSet findresource
/FontReport get exec
```

NOTE: In the escape code sequence for scalable fonts, the "_" (underscore) character is where you fill in the point size you need, since it is a scalable font.

LW Driver 8.x: PPDs Job Control/Page Control Commands (11/93)

Revised: 11/12/93
Security: Everyone

LW Driver 8.x: PPDs Job Control/Page Control Commands (11/93)

==========

Article Created: 12 November 1993

TOPIC ----------

1) Does Apple use/support "Type 4.1" PPD files?

2) Do the LaserWriter 8 PPDs support HP PCL Job Control Language (JCL) and Printer Job Language (PJL)?

3) What is Job Control Language (JCL) and Printer Job Language (PJL)?

DISCUSSION----------

Here are the answers to your questions:

1) Yes. Starting with LaserWriter driver 8.1.1, Apple started using Type 4.1 PPD files.

2) You must be referring to PCL Job Control Commands and Page Control Commands. These commands are actually not a function of the PPD's, but are of the respective PCL emulator in the various LaserWriters. Most of Apple's LaserWriter printers, except for the LaserWriter Select 360, provide HP LaserJet IIp, PCL 4+ emulation.

   The LaserWriter Select 360 provides HP LaserJet III, PCL 5 emulation.

   In terms of what PCL Job Control Commands and Page Control Commands are supported, there is an article in the Tech Info Library ("LaserWriters: Differences in HP Emulation") that outlines the differences between our HP LaserJet IIp emulation and the actual printer. With regard to our HP LaserJet III (PCL 5) emulation, there is no information on differences (if any) to the actual printer, though Apple has tried a lot of the commands and they work fine.

3) We have provided an outline below of what PCL Job Control Commands and Page Control Commands provide. For more in-depth information, refer to the PCL 5 Printer Language Technical Reference Manual, Manual part# 5961-0509, published by Hewlett Packard.

Here are some excerpts from the PCL 5 Printer Language Technical Reference Manual. These would apply mostly to the LaserWriter Select 360 since it has PCL 5 emulation.

Job control commands are usually grouped together and sent at the beginning of a job. Page control commands and data are associated with each printed page of a job.

JOB CONTROL COMMANDS include the following:
- Printer Reset.
- Universal End of Language/Start of PJL
- Number of Copies.
- Simplex/Duplex Print
- Left and Top Offset Registration
- Duplex Page Side Selection
- Job Separation
- Output Bin Selection
- Unit of Measure.

PAGE CONTROL COMMANDS include the following:
- Page Size
- Paper Source
- Logical Page Orientation
- Print Direction
- Text Area
- Left Margin
- Right Margin
- Clear Horizontal Margins
- Top Margin
- Text Length
- Perforation Skip
- Horizontal Motion Index
- Vertical Motion Index
- Line Spacing

Portable StyleWriter: Printing Difficulty and PowerBooks (11/93)

Revised: 7/8/94
Security: Everyone

Portable StyleWriter: Printing Difficulty and PowerBooks (11/93)

==========

Article Created: 12 November 1993

TOPIC ----------

I am having trouble printing from my Macintosh PowerBook 170 to a Portable StyleWriter.

Here are some specific question I have:

1) Does the Powerbook have to be turned on before the Portable Stylewriter?

2) Does the Powerbook have to stay awake while the Portable Stylewriter is printing?

3) How does the Spoolmaster react when you change applications after it has started to print?

DISCUSSION ----------

Here are the answers to your questions:

1) Does the Powerbook have to be turned on before the Portable StyleWriter?

ANSWER: No. The only thing you must do is make sure that if the Portable StyleWriter is connected to the printer port, you should have Appletalk turned OFF. Otherwise, the Portable StyleWriter will print gibberish when the computer is turned ON, this is because Appletalk sends out packets as part of its initialization.

2) Does the Powerbook have to stay awake while the Portable StyleWriter is printing?

ANSWER: Yes, otherwise the current line being printed will look "warped." Unfortunately, there is no code in Spoolmaster to warn users about putting Powerbooks to sleep while printing.

3) How does the Spoolmaster react when you change applications after it has started to print?

ANSWER: We were unable to verify any problems while switching out of Spoolmaster. We even had our PowerBook Control Panel set to "Maximum Conservation," and did not have any trouble printing. The only suggestion we have is to try a clean install of system software (by throwing away the old System Folder first).

Apple Remote Access: Ways To Access The Modem Ports (5/96)

Revised: 5/30/96
Security: Everyone

Apple Remote Access: Ways To Access The Modem Ports (5/96)

==========

Article Created: 15 November 1993
Article Reviewed/Updated: 30 May 1996

TOPIC -----

This article describes the three basic ways of accessing the modem ports in Apple Remote Access MultiPort Servers.

DISCUSSION -----

There are three basic ways to configure the modem ports: Dial-in access, Dial-in and transfer, and Callback only. Also, users cannot access a configured port until it has been turned on in the Port Configuration window.

The ARA Multiport Server does not support the built-in serial ports. The ARA Multiport Server will only function over NuBus communication cards such as the ARA Serial Card for modem connections.

"Dial-in access" allows dial-in and/or callback access on the same port. With this method, a user who does not have callback enabled is able to dial in and remain connected. This is useful if you have a number of users who are on the road and cannot provide you with a callback number. If the user has callback enabled, when the user dials in, the server checks that the user name and password are correct. If they are correct, the user is disconnected, and the server calls him or her back on the same port.

Ports set to "Dial-in and transfer" are intended only for users who have callback enabled. When such a user dials in, the server checks that the user name and password are correct. If they are correct, the user is disconnected, and the server calls him or her back through a different, "Callback only" port. Users for whom you have not set up callback can dial in to "Dial-in and transfer" ports, but they will be disconnected. Users who do not have callback enabled must use "Dial-in access" ports.

"Callback only" ports cannot receive calls. They are used only in

conjunction with ports that have been configured for "Dial-in and transfer" and the rest for "Callback only." Thus, you can have a maximum of 15 callback lines, depending on the number of Remote Access Serial Cards installed and modems connected to the ports. This method allows you to provide only one telephone number to your users.

Article Created: 15 November 1993

TOPIC -----

This article describes the features for Apple Remote Access Client for Macintosh.

DISCUSSION -----

Ease of installation and use

- Lets users get started in only minutes
- Allows users to access services remotely, in the same intuitive way as they work with services locally
- Provides built-in context-sensitive help

Adaptability

- Works with all Apple Remote Access–compatible servers, including both the Apple Remote Access Personal Server and the Apple Remote Access MultiPort Server
- Supports both Apple Remote Access 1.0- and 2.0-compatible servers
- Offers a range of dialing and connection options
- Supports a variety of leading modems

Remote productivity

- Supports System 7, so users can work with such familiar features as the Chooser, Finder, and Alias Manager
- Helps users manage everything from repeat connections to connection time
- Masks the complexities of the worldwide telephone system through its integrated DialAssist technology

Powerful security features

- Allows administrators to select the level of security that's most

appropriate for their organization's needs (when used in conjunction with the Apple Remote Access MultiPort Server software)
- Provides users with a secure method of access, whether they're connecting from home or from a hotel outside the country

Apple Remote Access Client for Macintosh provides an easy, productive, and secure way to connect a desktop Apple Macintosh or PowerBook computer to information and resources at a remote location. And because it works with all Apple Remote Access–compatible products—including the Apple Remote Access MultiPort Server and Personal Server software—it lets you choose the level of server support you need, whether you belong to a small workgroup or a multinational corporation.

Apple Remote Access Client for Macintosh software is designed with efficiency and productivity in mind. It installs in minutes and is remarkably easy to use, minimizing the need for ongoing support. For example, the software's built-in DialAssist technology makes dialing back to the office network simple, even for international travelers. It lets you build dialing sequences that help mask the complexities of worldwide telephone system—so you can connect easily from anywhere in the world. And Apple Remote Access Client for Macintosh has features that help you manage everything from repeat connections to connection time.

In addition, because it supports System 7, Apple Remote Access Client software lets you work with such familiar features as the Chooser, the Finder, and the Alias Manager. In short, it provides everything Macintosh or PowerBook users need to help them to get their work done easily and efficiently—wherever they are.

ARA 2.0 MultiPort Server: Configuring Modem Ports (5/96)

Revised: 5/30/96
Security: Everyone

ARA 2.0 MultiPort Server: Configuring Modem Ports (5/96)

==========

Article Created: 15 November 1993
Article Reviewed/Updated: 30 May 1996

TOPIC ----------

This article describes how to configure the modem ports for regular telephone lines on the Apple Remote Access MultiPort Server.

DISCUSSION ----------

To configure modem ports do the following steps:

1) Choose Configure Ports from the Server menu.

   The Port Configuration window appears. This window contains information about services installed on the server computer and the configuration of each port.

2) Click the triangle next to Modem Service (or double-click the line) to display all installed cards.

3) Click the triangle next to the Apple Remote Access Serial Card (or double-click the line) to display the name, status, and configuration of each port.

   The port name is determined by the slot in the computer in which the card is installed and the number of the port on the card. For example, Slot 1 Port 1A indicates that the Remote Access Serial Card is installed in Slot 1 in the server computer, and that Port 1A is selected. Each connector on the cable is labeled 1A or 1B, 2A or 2B to match the ports on the card. This identifies what port is used when a modem is connected to the card.

4) Select the port you want to configure by clicking it.

   The Open button becomes active. Initially ports are turned off; that

is, they are inactive. Once you configure each port, you can turn it on to make it active.

5) Click the Open button. You can also double-click the port name to open the Port window.

   The Port window appears for each port you select. The name of the port appears in the title bar.

6) Enter text in the Port Info text box, such as the name of the modem connected to the port and the telephone number of the line connected to the modem.

7) From the Port Access pop-up menu, select on the following options:
   - Dial-in Access
   - Dial-in and Transfer
   - Callback

8) From the Modem pop-up menu, select the modem script for the modem you've attached to the port.

   See the Read Me file in the Apple Remote Access MP Folder for a list of supported modems. If your modem does not appear on that list, see the Apple Remote Access Modem Scripting Guide, included in the package, for information on writing your own script. To write your own script, you will need the Modem Workshop, which is included in the Apple Remote Access MultiPort Server Toolkit disk.

9) Turn the modem speaker on or off by clicking the On or Off button.

   When the modem speaker is on, you can hear when the modem is making a connection with another modem. However, if modem noise is a concern, you can turn off the modem speaker.

10) Select Tone or Pulse for the dialing capability of your telephone line.

    Select Tone if the telephone line to which the modem is connected supports touch-tone dialing Select Pulse if the telephone line to which the modem is connected supports pulse or rotary dialing.

11) Click the Ignore Dial Tone checkbox if you always want the modem to dial, regardless of its ability to recognize the tone provided on the telephone line.

12) Click Save to save these settings for the port.

    If you click Revert, the contents of the window are not saved.

13) Click the close box to close the Port window.

    The Port Configuration window is still visible. Now that you've configured the port, you must turn it on to make it active for receiving and/or making calls.

14) Select the port and click the Turn On button to turn on the port.

    Note: If you are using the Security Zone software, you will be required to enter a password at this point. You will only be required to enter this password the first time you turn on a port.

Note: The ARA MultiPort Server does not support the built-in serial ports. The ARA MultiPort Server will only function over NuBus communication cards such as the ARA Serial Card for modem connections.

ARA 2.0 MultiPort Server: Creating New Users (11/93)

Revised: 11/12/93
Security: Everyone

ARA 2.0 MultiPort Server: Creating New Users (11/93)

==========

Article Created: 15 November 1993

TOPIC ----------

This article describes creating new users on the Apple Remote Access MultiPort Server.

DISCUSSION ----------

1) If the User List is displayed, click the New button; otherwise, choose Create User from the Users menu.

   A New User information window appears. Require New Password on Next Login and maximum connection time set to 60 minutes are selected by default.

2) Enter the user's name.

   For sorting to work properly, enter user names first name first (for example, Joe User).

3) Type a password in the Password text box.

   The user must enter this password when calling the server. Make sure to inform the user of the exact password, including capitalization.

4) Use the Remarks text box to enter information about the user, such as a department or project name.

   This information is included in the server activity log when the user connects to the server and can be useful for call accounting or chargeback applications.

5) Click the Dial-in Access Enabled checkbox so that the user can log in to the server.

If you want to revoke the user's dial-in access at a later time, you can click the checkbox again to deselect this option.

6) Click the Change Password Enabled checkbox if you want to allow the user to change his or her password after logging in.

   This allows the user to make user-initiated password changes. The administrator can also change passwords for any user in the User information window.

7) Click the Require New Password on Next Login checkbox to force the user to create a new password at the next login time.

   This option is deselected once the user changes his or her password. This option works even if the Change Password Enabled option is not selected.

8) If necessary, click the "Maximum connection time" checkbox and enter a time in minutes if you want to limit the amount of time for which the user can connect to the server.

   The default connection time is 60 minutes. You can enter another time if you wish. Deselecting this option will give the user unlimited access time.

9) If you want to require callbacks, click the "Call Back at #" checkbox and type in the callback number.

   The callback number is the telephone number provided to you by a user for remote access. Selecting this option means that when the user calls the server, the server computer will temporarily disconnect the user, then immediately call the user at the number you've entered. The callback feature is optional; it provides an extra level of security, because the user must call from a specific phone number.

   You enter the phone number as if you were dialing directly. Type in any dialing prefixes, such as "1" for long distance calling in the U.S. and an area code. If the server needs to dial an outside line (as in many business phone systems), type the outside line number, followed by a comma. For example, type "9,1-415-555-1234". The comma in this example indicates a pause during dialing so that the modem can connect to an outside telephone line from a PBX. The hyphens are included for readability but are not required.

10) If you selected an external security module in the Server Preferences dialog box, the name of the module appears in this dialog box with a checkbox next to it. Click the checkbox to enable the security feature for this user.

    Note: If you selected the External Security Required for All Users option in the Server Preferences dialog box, the security option will already be selected. The name of the module will be dimmed, and you will not be able to deselect this option.

11) Click the Configure button to configure external security.

    A dialog box appears in which you can set security parameters. Click OK when you have finished.

12) Enable access to one or more zones by making a selection from the "Allow Access to" pop-up menu in the Zones area.

    You can determine which, if any, zone on your network a user can access by selecting an option from the "Allow Access to" pop-up menu. There are four options for user zone access:

    - This Macintosh Only. The user has access only to the services available on the server Macintosh.
    - Only Zones Listed. The user has access to the zones listed in the Zone List in the User information window. The server zone is always part of the list and cannot be deleted.
    - Entire Network. The user has access to all the zones on the network.
    - All Zones Except Listed. The user has access to all the zones on the network except the ones listed in the Zone List in the User information window. The zone the server is in cannot be put on this list because the user always has access to the server zone.

    If you choose Only Zones Listed or All Zones Except Listed, a dialog box appears from which you select which zones will appear on the user's Zone List.

13) Select one of more zones and click Add to add these zones to the Zone List in the User information window.

14) Click Save.

ARA 2.0 MultiPort Server: How To Export User Lists (11/93)

Revised: 11/12/93
Security: Everyone

ARA 2.0 MultiPort Server: How To Export User Lists (11/93)

==========

Article Created: 15 November 1993

TOPIC ----------

This article describes how to export the User List into a tab delimited text file, which you can then import to another server.

DISCUSSION ----------

To export the User List:

1) Make sure that the User List window is active.

2) Choose Export User List from the Users menu.

   A directory dialog box appears in which you can name the exported User List and save it.

3) Enter a name and click Save.

   The exported list is saved. You can view the list in any application that accepts tab delimited data.

IMPORTANT: Although a Password header appears in the document, passwords are not exported.

ARA 2.0 MultiPort Server: Getting Users Ready To Use (11/93)

Revised: 11/12/93
Security: Everyone

ARA 2.0 MultiPort Server: Getting Users Ready To Use (11/93)

==========

Article Created: 15 November 1993

TOPIC ----------

This article describes getting users ready to use the Apple Remote Access MultiPort Server.

DISCUSSION ----------

Make sure that you provide Apple Remote Access Client for Macintosh version 2.0 software and documentation to all registered Remote Access users. Installation instructions are provided with the Apple Remote Access Client for Macintosh User's Guide.

A license and documentation for four clients is included with each Apple Remote Access MultiPort Server you purchase. Additional copies may be purchased individually or in volume through Apple's Volume licensing program.

Before users can log in to the server, you must tell them their login names and passwords. You should also briefly explain what they can expect during the first login. Make sure that the Dial-In Access Enabled option is selected for all users to whom you want to provide dial-in access, and that you have provided them with the dial-in number for the server.

Finally, if your server is using any external security modules, make sure that this software has also been provided to users, and that you have explained how to use it.

ARA 2.0 MultiPort Server: Importing User List Info (11/93)

Revised: 11/12/93
Security: Everyone

ARA 2.0 MultiPort Server: Importing User List Info (11/93)

==========

Article Created: 15 November 1993

TOPIC -----

This article describes how to import User List information on the Apple Remote Access MultiPort Server.

DISCUSSION -----

To Import information to a User List:

1) Create a user database file and save it.

2) Choose Import User List from the Users menu.

3) Select a file from the directory dialog box and click Open.

4) Select an option to continue.

   Once the information is imported, the current User List is updated. Any errors that occur during the import are written to the server activity log.

More Detail

You can create a tab delimited text file containing user information, such as names, password, and login access, and then import the information into Remote Access Manager to create a new User List or to add users to the current User List.

NOTE: You cannot import zone information or external security settings.

The first record in the imported file is a header record that contains the names of the fields that are to be imported. The only mandatory field is the Name field, which must be the first field specified. It is used as the key for matching the record in the imported file with the users existing in

the user List. All fields in the header record must have corresponding values in the imported file, or processing will stop at the record with the missing data.

Any record in the imported file that has no match in the existing User List is inserted into the User List. Any fields not included in the header record are replaced with the default values.

To import the information in the tab delimited text file to the current User List, use the Import User List command from the File menu. Once you begin the import operation, a dialog box appears containing the following four options:

- Merge
- Replace
- Ignore
- Cancel

Select one of these options to determine how the information will be imported.

If new records exist in the imported file but do not exist in the User List, they are added to the User List. Fields in new records that do not contain information are filled with the default values. However, if a user name appears in both the file you are importing and in the current User List, the results of the import operation differ depending on the option you select.

Merge

Select Merge to combine the records from the imported file with the records from the User List. Fields in the existing User List are replaced by the fields from the imported file. Any fields that are not specific in the header record remain unchanged and retain the values from the existing User List.

Use the Merge option to add data to an existing User List while retaining some of the existing values. For example, you could change the callback numbers for a set of users without changing their passwords or zone access.

Replace

Select Replace to replace matching records in the existing User List with matching record from the imported file. Fields that are not present in the header record are filled with the default values.

Use Replace if you need to make changes that affect every field in matching records. For example, you can quickly change maximum connection time to the default value.

WARNING: Using the Replace option can cause you to lose information. For example, if the imported file does not specify passwords and you select Replace, the passwords for the matching records in the User List are lost.

Ignore

When Ignore is selected, any record in the imported file that matches an existing record in the User List is skipped, and import continues with the next record in the file. No values in the existing record are changed.

Cancel

Cancels the operation.

IMPORTANT: When you import User List information, you change your current User & Groups Data File. Make sure that you back up this file by duplicating and renaming it in the Preferences folder.

ARA 2.0 MultiPort Server Features (11/93)

Revised: 11/12/93
Security: Everyone

ARA 2.0 MultiPort Server Features (11/93)

==========

Article Created: 15 November 1993

TOPIC ----------

This article describes the features for Apple Remote Access MultiPort Server.

DISCUSSION ----------

Ease of installation and use

- Takes only minutes to set up a server and to add users or ports as needed
- Provides built-in context-sensitive help

Multilevel security

- Provides a variety of sophisticated security features, making it one of the most secure remote access servers available
- Is supported by leading third-party security vendors, so administrators can choose to augment its built-in capabilities with additional security modules

Scalable solution

- Turns a single Macintosh computer into a server that can support from 4 to 16 simultaneous connections*
- Runs on a variety of Macintosh computers, so you can choose the system that's appropriate for your needs

Powerful administrative capabilities

- Allows flexible port configurations
- Offers comprehensive user-management facilities
- Supports industry-standard SNMP
- Tracks resource usage and automatically generates an activity log that can be exported for further analysis

Flexible client capabilities

- Supports a variety of connections, including cellular, X.25, and ISDN**
- Is fully integrated with Macintosh System 7, so remote users can work with such familiar tools as the Chooser, Alias Manager, and the Finder

The Apple Remote Access MultiPort Server provides a flexible, scalable, and secure way to offer network access to large numbers of remote or mobile users. Used in conjunction with one or more Apple Remote Access Serial Cards, it converts a single Apple Macintosh computer into a server that can support from 4 to 16 simultaneous connections.* This makes it an ideal solution for workgroups or entire organizations that want to enable employees to work productively and efficiently no matter what their location, whether they're in the office, out of town, or even out of the country.

Unlike conventional complex server software, the Apple Remote Access MultiPort Server is designed to streamline administrative tasks, while maximizing administrator productivity and control. The software installs in minutes and features sophisticated management capabilities, including industry-standard Simple Network Management Protocol (SNMP) support. This allows administrators to flexibly manage and maintain connections. Adding ports is simple, and the server features an automatically generated activity log that can be exported to a variety of programs for further analysis.

On the client side, the Apple Remote Access Client for Macintosh software is also designed with efficiency and productivity in mind. From its single-step installation to such productivity-enhancing features as full System 7 integration and extensive connection-management capabilities, it provides everything users need to help them get their work done easily and efficiently—wherever they are.

Users can also rest assured that their work will be secure. The Apple Remote Access MultiPort Server offers a host of sophisticated security features that allow administrators to maintain the integrity of the network. These features, such as password aging, location validation, and the ability to filter access to services, make it one of the most secure remote access servers available. And because its security architecture is supported by leading third-party security vendors, administrators can choose to augment the server's built-in security features with additional challenge-and-response security modules.

* The Apple Remote Access MultiPort Server includes support for 4 ports. Support for 8, 12, or 16 ports requires purchase of 1, 2, or 3 Apple Remote Access MultiPort Server 4-Port Expansion Kits (respectively) and additional Apple Remote Access Serial Cards and Apple RS-232 cables.

** X.25, ISDN, and cellular connections require additional Apple or third-party products.

ARA 2.0: Requirements, Remote Access MultiPort Server (5/95)

Revised: 5/24/95
Security: Everyone

ARA 2.0: Requirements, Remote Access MultiPort Server (5/95)

==========

Article Created: 15 November 1993
Article Reviewed/Updated: 24 May 1995

TOPIC ----------

This article describes the minimum requirements for using the Remote Access MultiPort Server.

DISCUSSION ----------

Hardware requirements

The following are the hardware requirements for setting up and running a Remote Access MultiPort Server:

- Any Macintosh computer with slots for 12-inch NuBus cards and an Apple SuperDrive for high-density floppy disks.
- 5MB RAM for a 4-port server; 8MB RAM for a 16-port server
- A hard disk
- An Apple Remote Access Serial Card and an Apple RS-232 cable
- One or more high-speed modems
- A telephone line for each modem

Software requirements

Your Remote Access MultiPort Server package includes installer disks, which contain all the software you need to run the Remote Access MultiPort Server and Remote Access Manager application. Additionally, you must be running system software version 7.0 or later on your server computer (7.1 is recommended).

Macintosh clients need to run System 7 and should have either Apple Remote Access Personal Service for Macintosh version 2.0, or Apple Remote Access Client for Macintosh version 2.0 software installed.

Network requirements

Connect your Remote Access MultiPort Server to an AppleTalk network using the same type of networking software and cable types as used with other devices on your network. Any AppleTalk network is capable of supporting a Remote Access MultiPort Server. The most common network choices are LocalTalk, Ethernet, and Token Ring.

ARA 2.0 Personal Service or Client and PowerBook (11/93)

Revised: 11/12/93
Security: Everyone

ARA 2.0 Personal Service or Client and PowerBook (11/93)

==========

Article Created: 15 November 1993

TOPIC ----------

This article describes potential problems you may encounter while using Apple Remote Access Personal Service or Client on PowerBook computers and offers suggestions for solving these problems.

DISCUSSION ----------

1) When running Remote Access Personal Service or Client on any PowerBook with an internal modem:

   Remember that the PowerBook control panel controls which physical modem port the PowerBook will use. Make sure your port selection in the Remote Access Setup window and modem script selection are consistent with the PowerBook control panel.

   For example, if you want to use your internal Apple Data Modem, you must do the following:

   - In the PowerBook control panel, click the Internal Modem button.

   - In the Remote Access Setup window, choose Apple Modem 2400 from the Modem pup-up menu.

2) When running Apple Remote Access Personal Service or Client on any model PowerBook with an Express Modem:

   - In the PowerBook control panel you change from Internal to External Modem. Then you go to the Remote Access Setup window to select the appropriate port and there is no external modem pop-up selection. You need to close the Remote Access Setup window, then open it again to get both selections.

   - You have an active Remote Access connection using the Express Modem.

If the PowerBook goes to sleep (either because you put it to sleep or because it went to sleep automatically) the PowerBook will freeze. Restart your computer by pressing the reset button. In order to have the Sleep option function correctly, you must first disconnect your Remote Access connection.

- Disregard the Express Modem Read Me which states that you should automatically remove the Serial Port Arbitrator from the Extensions fold in the System Folder. Only remove the Serial Port Arbitrator if it is causing problems (for instance, other programs that use the serial port don't function properly, you see a dialog box that says the serial port is in use, or your PowerBook freezes during shutdown).

3) When running Apple Remote Access Personal Service on any model PowerBook that contains an Express Modem:

- You have the "Answer Calls" checkbox selected in the Remote Access Setup window and change from External to Internal Modem in the PowerBook control panel. An alert box appears which states, "This setting cannot be changed while the Internal Modem is in use." Click the Cancel button and then:

  - In the Remote Access Setup window, deselect the "Answer Calls" checkbox
  - In the PowerBook control panel, click the Internal Modem button
  - In the Remote Access Setup window, click the "Answer Calls' checkbox

- You have the "Answer Calls" checkbox selected in the Remote Access Setup window. If you go to the Express Modem control panel and click the Off button and then click the On button, you will have disabled you ability to answer or make calls. You must restart your computer.

ARA 2.0 Personal Server for Macintosh Features (11/93)

Revised: 11/12/93
Security: Everyone

ARA 2.0 Personal Server for Macintosh Features (11/93)

==========

Article Created: 15 November 1993

TOPIC -----

This article describes the features for Apple Remote Access (ARA) Personal Server for Macintosh.

DISCUSSION -----

Ease of use

- Installs in only minutes
- Provides everything you need for both the calling and the answering Macintosh computers—client and server software—in one convenient package*
- Lets individuals or small organizations access services remotely, in the same intuitive way as they work with services locally
- Requires no specialized equipment

Adaptability

- Enables individuals or small organizations to take advantage of remote access to a single Macintosh computer or an entire AppleTalk network
- Supports a variety of leading modems
- Supports a range of network types, including LocalTalk, Ethernet, and Token Ring

High performance

- Features built-in industry-standard data compression and error detection
- Provides increased efficiency, with Apple's smart-buffering technology
- Is optimized for a variety of connection types

Built-in security

- Includes several security options that allow you to restrict access to information

- Generates an activity log to track usage

Flexible client capabilities

- Supports a variety of connections, including cellular, X.25, and ISDN**
- Is fully integrated with Macintosh System 7, so remote users can work with such familiar tools as the Chooser, Alias Manager, and the Finder

ARA Personal Server software includes everything you need to allow a Macintosh computer to communicate with another Macintosh or an entire AppleTalk network over standard telephone lines. It takes only minutes to set up and offers powerful capabilities that can help make an individual or a small workgroup of Macintosh users even more productive, no matter where they are.**

With ARA Personal Server, you can work wherever you like, at home or on the road, and retain access to all of the resources of your office computer or network. You and your colleagues can send and receive electronic mail, collaborate on a shared project, or print to a network-connected printer. Yet doing all of this is as simple as if you were working at your office.

Getting started with ARA Personal Server is easy. The software features single-step installation that requires no special technical knowledge. And ARA Personal Server adjusts automatically to the type of network you're calling, leaving you free to focus on your own work instead of worrying about the details of networking.

In today's increasingly complex and mobile world, ARA Personal Server provides convenient, direct access to information and resources at a remote location for computer users on the go. So, whether you want to share files with a neighbor or collaborate on a project with colleagues around the world, ARA Personal Server can help you get the job done quickly, easily, and affordably.

* Includes software for one client. Additional client software must be purchased or licensed separately.

** X.25, ISDN, and cellular connections require additional Apple or third-party products.

Revised: 11/12/93
Security: Everyone

ARA 2.0 Personal Server Tech Specifications (11/93)

==========

Article Created: 15 November 1993

TOPIC -----

This article describes the technical specifications for Apple Remote Access (ARA) Personal Server for Macintosh.

DISCUSSION -----

Modem support and scripts

- Supports any Hayes-compatible 2400-bps, 9600-bps, or higher-speed modem with the appropriate script. Modem scripts for many popular modems are included:

  - V.32bis modems (14,400 bps): Apple Express Modem, Global Village PowerPort Gold, Global Village TelePort Gold, Hayes Optima 144, Microcom QX4232bis, Prometheus ProModem 144e, PSI Powermodem IV, Supra SupraFax v.32bis, Telebit T3000, Telebit WorldBlazer

  - V.32 modems (9,600 bps): Global Village PowerPort Silver, Global Village TelePort Silver, Prometheus Promodem 96, PSI Powermodem III, Supra SupraFax Modem Plus, Telebit QBlazer , Telebit T1600, US Robotics Sportster, US Robotics Worldport

  - V.22bis modems (2400 bps): Apple 2400, Global Village PowerPort Bronze, Global Village TelePort Bronze, Hayes Optima 2400, Microcom AX 2400C, Prometheus Promodem 24, PSI PowerModem II

- Cellular Support: Applied Engineering DataLink PB and Applied Engineering Axcell Cellular Interface, Microcom Cellular Data Link 300

- ISDN support: Hayes ISDN adapter

- Additional scripts may be available. Contact an authorized Apple dealer or representative or your modem manufacturer for more details.

- If you understand connection control languages (CCLs) and are an experienced programmer, you may be able to write the necessary modem script yourself.

Network types supported

- Support for any AppleTalk network; the most common network choices include:
  - LocalTalk
  - Ethernet
  - Token Ring

Connection types supported

- Standard telephone
- Cellular*
- ISDN*

Error detection, Data compression

- Support for several built-in components that allow for error-free and optimized delivery of data
  - Smart buffering (developed by Apple Computer) for data-transfer optimization
  - MNP, an industry standard for error detection
  - V.42bis, an industry standard for data compression

Security

- User name and password authentication
- Callback feature that verifies the user's identity by returning calls to a predetermined phone number
- Activity log for recording calling and answering activities
- User account disabled after seven incorrect password attempts

Specifications

- Maximum number of simultaneous connections: 1
- User name maximum length: 31 characters
- Password maximum length: 8 characters
- Maximum connect time: selectable
- Total number of user records: 100
- Maximum number of activity log entries:1,000

Licensing information

- Comes with license to copy and install the Apple Remote Access Personal Server software for your own use on up to two Apple computers owned and/or operated by you.
- Additional client software must be purchased or licensed separately; consult your authorized Apple reseller or representative for information.

System requirements

- A Macintosh Plus or later model with at least 4MB of RAM
- A hard disk drive
- Macintosh system software version 7.0 or later
- An Apple or other Hayes-compatible modem (2400 bps minimum; 9600 bps or higher speed recommended) and appropriate modem cable, if needed
- Apple Remote Access Client for Macintosh version 2.0

Ordering Information

Apple Remote Access Personal Server for Macintosh
Order No. M2726Z/A

- Apple Remote Access Personal Server software and installer
- Apple Remote Access Personal Server for Macintosh User's Guide
- Apple Remote Access DialAssist quick-reference card
- Modem scripts for a range of Hayes-compatible modems (additional modem scripts may be available; contact an authorized Apple reseller or representative, or your modem manufacturer, for details)

Apple Remote Access Personal Server Upgrade Kit
Order No. M2678Z/A
Upgrades AppleTalk Remote Access Personal Service version 1.0 to Apple Remote Access Personal Server software version 2.0

Apple Remote Access Client for Macintosh (single-pack)
Order No. M5227Z/A

Apple Remote Access Client for Macintosh 10-Pack
Order No. M2692Z/A

Apple Remote Access Modem Toolkit version 2.0
Order No. R0129LL/C

This product is available from APDA.

* ISDN and cellular connections require additional third party products.

ARA MultiPort Server: Basic Security Information (11/93)

Revised: 11/12/93
Security: Everyone

ARA MultiPort Server: Basic Security Information (11/93)

==========

Article Created: 15 November 1993

TOPIC -----

This article provides basic information about the Apple Remote Access MultiPort server's security.

DISCUSSION -----

You can establish and control server security through a number of features in the Remote Access Manager software.

User Registration

Guest User is a generic account for guest users of remote access service. Anyone on the network can be a guest; a guest is not assigned a password and generally has limited network access. In the interest of security, you should limit the amount of access that guests have on your network.

A registered user is anyone for whom you have assigned a user name, password, and security options.

Password and callback security

You can increase the security of your network by requiring that each registered user enter a password to access the server. You should provide registered users with a unique password the first time they log in and require that they change the password at that time. Selecting the Require New Password on Next Login option in the User information window will ensure that all users must change their passwords after the first time they log in.

Requiring a callback number for users further ensures security because users can only connect to the server using a telephone number that they have provided to you. When a user successfully logs in, he or she is immediately disconnected from the server. The server then attempts to make

a connection at the callback number listed for that user. If the telephone number is valid, a connection is made.

Zone access

Zones are logical subdivisions of a network in which services such as file servers, printers, and other individual Macintosh computers reside. Zones appear in the Chooser window. You can use zones to organize services into logical groups. The Apple Remote Access MultiPort Server administrator can assign each user access to specified zones on the network.

Security Zone

The Security Zone feature prevents individuals from setting up an Apple Remote Access MultiPort Server or Apple Remote Access Personal Service without an authorizing password. Security Zone software is provided on the Apple Remote Access MultiPort Server Toolkit disk. For instructions on how to implement this feature, see the Read Me file provided with the software.

External security

You can provide an additional level of security by implementing third-party, external security. For example, additional security would be appropriate for those who need roving access (for PowerBook users). Two types of external security are available: line-level security and protocol-level security.

Line-level security provides security at the telephone line level and usually consists of hardware that is connected to the server and security software module that is placed on the clients' workstation.

Protocol-level security provides security at the software level and usually consists of security software modules that are placed on both the server and the clients' workstations. You can install more that one security module on both the server and clients' workstations, but you can activate only one security module at a time.

ARA MultiPort Server Shares User Data With AppleShare (11/93)

Revised: 11/12/93
Security: Everyone

ARA MultiPort Server Shares User Data With AppleShare (11/93)

==========

Article Created: 15 November 1993

TOPIC -----

This article describes the sharing of user database information between AppleShare and Apple Remote Access (ARA).

DISCUSSION -----

If you have installed the Apple Remote Access MultiPort Server on the same computer as your AppleShare server, the user database is shared between them. The user database is called the "User List" in ARA and the "Users & Groups Data File" in AppleShare.

All users from the AppleShare Users & Groups Data File appear in the Remote Access Manager User List as registered users, but you must select login and callback options for them. Remote Access Manager does not support the AppleShare Groups feature; any groups that you have created with AppleShare do not appear in the User List.

IMPORTANT: Any changes you make to the User List, such as adding or deleting users, will affect the AppleShare Users & Groups Data File.

Any changes that you make to a User information window, such as changing the login name or password, also affects the AppleShare Users & Groups Data File.

IMPORTANT: Since AppleShare Admin and Remote Access Manager use the same user database, you cannot run both applications at the same time. However, if you lock the Remote Access Manager, you can run the AppleShare Admin application. To lock the Remote Access Manager, choose Lock Server Manager from the Server menu.

ARA 2.0: Starting the MultiPort Server After Booting (11/93)

Revised: 11/12/93
Security: Everyone

ARA 2.0: Starting the MultiPort Server After Booting (11/93)

==========

Article Created: 15 November 1993

TOPIC -----

This article describes what needs to be done to start the Apple Remote Access MultiPort Server immediately after the server's computer boots.

DISCUSSION -----

The Remote Access Manager application does not have to running for the server to be active. However, the Remote Access Manager must be run once to start up the server. After that, you can quit the Remote Access Manager and the server will keep running.

If you want the server to automatically start up when the server's computer is booted up, place the Remote Access Manager application (or an alias) in the Startup Items folder, located in the System Folder.

Apple Remote Access: Underlying Technology (11/93)

Revised: 11/12/93
Security: Everyone

Apple Remote Access: Underlying Technology (11/93)

==========

Article Created: 15 November 1993

TOPIC ----------

This article describes the underlying technology of Apple Remote Access for Macintosh.

DISCUSSION ----------

ARAP 2.0

The AppleTalk Remote Access Protocol (ARAP) provides efficient AppleTalk services on a per client basis over slow links. It defines the login and authentication sequences. The ARAP specification has been enhanced to include the ability to change passwords, to allow password retries, to authenticate a user using external third-party security devices, and to send out-of-band messages such as alerts and greetings. In addition to the above enhancements, ARAP Version 2.0 will now allow administrators of the Apple Remote Access Server to set the specific zones each user can see.

Note: The protocol enhancements are what allow for the new functionality; therefore, the client side of Apple Remote Access is compatible with ARAP 1.0 based products, however, users will not be able to take advantage of the ARAP 2.0 features when connecting to ARA 1.0 servers.

Also the client side of ARA 1.0 is not compatible with the ARA 2.0 servers.

Remote password change

Provides a method for a user to remotely change their password (without having to use AppleShare as was necessary with 1.0). Allows the administrator to set the number of retries allowed before user logon is disabled. Also allows the administrator to force users to change their

passwords via the "New password required" dialog.

Roving access security

Dial-back is not satisfactory for everyone who wants both security and mobility. We now add mobile security to our feature list by allowing for the use of third-party "security cards". With some "security cards" the user must type in a personal code and a requestor code into a credit card size calculator like device. The device will then return the SecureID. Other "security cards" are time based and constantly display current SecureID information. When trying to make a connection to a secure server, the user will see a dialog box requesting a SecureID. Without the SecureID and the standard username and password the user will not be able to get in to the network.

The ARAP 2.0 protocol was defined such that security extensions can be added as drop-in modules. Several third party security vendors have agreed to write the extensions that will allow their products to work with our servers.

X.25 connectivity

The new server software contains extensions that allow a user to connect to Remote Access through an X.25 network. This type of access is valuable in situations where the cost of X.25 asynchronous dial-up service is less than the cost of end-to-end service through the phone companies.

Remote administration

Since the initial release of ARA 1.0, large business users have requested enhanced remote administration and management capability. Remote administration allows for the servers to be locked up in a secure area and still be managed from the administrators desk. Customers often have many servers and would prefer to maintain only one database of registered users. Remote administration addresses this need by providing for the remote location of a shared user database. Integrated network management via SNMP is now a part of the MultiPort servers as well.

DialAssistant

This is a client software feature that makes long distance, credit card, international, and private PBX calling extremely easy for the user. The software is preconfigured with all of the most common dialing codes so that a user only has to select items from two pop-up menus.

System 7.1 Commonly Asked Questions (9/94)

Revised: 9/28/94
Security: Everyone

System 7.1 Commonly Asked Questions (9/94)

==========

Article Created: 12 November 1993
Article Reviewed/Updated: 28 September 1994

TOPIC ----------

This article presents common customer questions about system software version 7.1, and the answers.

DISCUSSION ----------

Q. What is WorldScript?
A. WorldScript supports most written languages in the base system software. WorldScript includes support for text input and display, as well as for incorporating language attributes, such as date and time formats.

This technology is incorporated into System 7.1 to provide the same system-level support for non-Roman languages, such as Japanese and Arabic, that Apple has always provided for Roman languages, such as English, French, German, and Spanish.

Q. Why am I getting a message about a 128-file limit on the Fonts folder?
A. The Fonts folder can hold a maximum of 128 files. This includes font suitcases, and individual font files like bitmapped (or screen) fonts and TrueType fonts. It doesn't include PostScript (or printer) fonts.

Suitcases can contain multiple font families and can be as large as 16MB. If you have more than 128 files, place individual bitmap or TrueType font files into suitcases, or merge suitcases. Merge suitcase files by dragging one suitcase file on top of another suitcase file.

Q. How do I create a font suitcase?
A. You can't create a font suitcase with System 7.1, but you can

duplicate an existing suitcase. If you need an empty suitcase, duplicate a suitcase and throw away its contents. You can duplicate the remaining suitcase as many times as you need.

Q. Is System 7.1 slower than System 7.0?
A. No. There are a few things you should check if performance seems slow:

- Make sure File Sharing and Virtual Memory are off when not in use.
- Check all third-party extensions for compatibility with System 7.1.
- Check the Views control panel to make sure "Calculate Folder Sizes" isn't checked.

Q. I'm using Adobe Type Manager and Suitcase with System 7.1. Do I need an upgrade?
A. System 7.1 requires version 3.0 or later of Adobe Type Manager (from Adobe Systems) and version 2.1.2 or later of Suitcase (from Fifth Generation Systems). Contact the manufacturers for specific upgrade information.

Q. I just upgraded from System 6, and now I'm getting random system errors.
A. Make sure all devices in the SCSI chain attached to your Macintosh computer are powered on before you start it up.

Try starting your Macintosh computer while holding down the Shift key to turn all extensions off. This will identify an extension (or INIT) conflict. If no errors result, an extension probably conflicts with the system or other extensions.

If your computer crashes when you have Virtual Memory on, contact your hard drive vendor to verify that your hard drive formatting software is compatible with System 7.1.

This article is one of many available through the Apple Fax center. For a complete list of available Fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

MODE32: Boot Drive SCSI ID Must Be Zero (9/94)

Revised: 9/12/94
Security: Everyone

MODE32: Boot Drive SCSI ID Must Be Zero (9/94)

==========

Article Created: 15 November 1993
Article Reviewed/Updated: 12 September 1994

TOPIC ----------

My Macintosh seems to continually restart if I install MODE32. If I boot from a floppy, the problem goes away so it appears to be related to MODE32. I need to use MODE32, what's wrong?

DISCUSSION ----------

If your boot drive uses software to change the SCSI ID, then you will need to set the ID to 0 if you are using MODE32, otherwise the machine just seems to continually restart.

Here is the technical explanation of what is going on. MODE32 must "stutter-start" the machine since the ROMs only have a 24-bit memory manager and some software (like the disk's driver) have already loaded and would have loaded in a different place if 32-bit addressing had been enabled. So, as soon as possible in the boot process, MODE32 gives the machine a 32-bit memory manager, and effectively restarts the machine to let things load in their proper space.

A potential problem exists here however. What if the machine then restarts off another disk? Perhaps it didn't spin-up quickly enough, or the user inserted a floppy at the wrong instant. The new disk may not even have MODE32 on it! So, if MODE32 detects restarts from a different SCSI ID, it does a full restart, figuring that by now all the disks should be up to speed, and the machine will consistently choose the same startup disk.

Some SCSI drives, however, use software to control their SCSI ID, and effectively restart (for a moment) as SCSI ID 0 no matter what the jumpers are set to. The only way MODE32 can work with these disks is to change the SCSI ID to 0 so it will be the same on both boots.

Newton Fax Modem: No Modem Connected Message (11/93

Revised: 11/15/93
Security: Everyone

Newton Fax Modem: "No Modem Connected" Message (11/93

==========

)Article Created: 15 November 1993

TOPIC ----------

I connected my Newton Fax Modem to my Newton MessagePad and to the telephone line. When I try to dial a phone number with the modem, my Newton displays the message "No Modem Connected."

What do I do now?

DISCUSSION ----------

If you see the message "No Modem Connected" when you try to dial a phone number, follow these steps:

1) Reset your Newton by pressing its reset switch.

2) Check your Fax Modem's power source. If the battery status light (the red LED) is on, your batteries are low. Replace the batteries or connect the AC adapter.

   Note: If the Fax Modem's batteries are completely discharged, the LED won't light.

3) Reset your Fax Modem by removing the batteries and disconnecting the AC adapter. Then replace the batteries and/or reconnect the AC adapter.

   This will reset the internal modem circuitry. Your Fax Modem should now work.

Newton Battery Booster Pack: When To Change Batteries (11/93)

Revised: 11/15/93
Security: Everyone

Newton Battery Booster Pack: When To Change Batteries (11/93)

==========

Article Created: 15 November 1993

TOPIC --------------------

How do I know when to change the batteries in the Newton Battery Booster Pack?

DISCUSSION --------------------

The battery gauge inside the Extras drawer displays the remaining capacity of all the Newton MessagePad's batteries. When the batteries are exhausted, the battery gauge's display bar will disappear and you will see a warning message on MessagePad's display.

The battery gauge reports the combined status of both the Booster Pack batteries and Newton's internal battery pack. When you see the low battery warning message, you must:

- Change all eight Booster Pack batteries

  and

- Either remove the internal battery pack or replace its batteries.

You do not need the internal battery pack in the Newton MessagePad while you are using the Battery Booster Pack. If your MessagePad has alkaline batteries in its battery pack, Newton will draw power from its internal battery pack and from the Booster Pack.

Do NOT attach a Battery Booster Pack to a MessagePad that contains a rechargeable internal battery pack, since this will shorten the life of the Booster Pack Batteries.

Newton Connection Kit: Connecting to Undocked Duo (11/93)

Revised: 2/23/94
Security: Everyone

Newton Connection Kit: Connecting to Undocked Duo (11/93)

==========

Article Created: 15 November 1993
Article Revised/Updated: 23 February 1994

TOPIC ----------

Whenever I use the Newton Connection Kit to synchronize my Newton MessagePad with an undocked PowerBook Duo, the Connection Kit returns an error message that says no connection could be established.

How can I make this configuration work?

DISCUSSION ----------

To use the Newton Connection Kit with an undocked PowerBook Duo, follow these steps:

1) Turn AppleTalk off by opening the Chooser application from the Apple Menu and clicking the AppleTalk Inactive radio button.

2) Connect one end of the serial communications cable to the Duo's modem/printer port.

3) If you are using a Duo 250 or 270c, open the PowerBook Setup Control Panel and set the modem setting to Normal; otherwise, set the Modem Control Panel settings to External Modem.

4) Connect the other end of the serial communications cable to the Newton's communications port.

You should now be able to operate the Newton Connection Kit with your PowerBook Duo.

Article Change History -
23 February 1994 - Added information on the Duo 250 and 270c Control Panel.

Newton MessagePad: 0011 Prefix Before Phone Number (11/93)

Revised: 11/15/93
Security: Everyone

Newton MessagePad: 0011 Prefix Before Phone Number (11/93)

==========

Article Created: 15 November 1993

TOPIC ----------

When I use the Assist button to place a phone call, the numbers '0011' are inserted before the phone number.

How can I stop this from happening?

DISCUSSION ----------

The numbers '0011' are being inserted in the Assist slip because your Newton MessagePad thinks this is an international call.

When you set your Country preference in your Personal Preferences, you must tap Country, then select a country from the list that appears.

If you write the country name in the Country preference blank instead of selecting from the list, your MessagePad will not understand what country you are in and this problem will occur.

Newton MessagePad: How to Avoid Scratching the Touchpad (11/93)

Revised: 11/15/93
Security: Everyone

Newton MessagePad: How to Avoid Scratching the Touchpad (11/93)

==========

Article Created: 15 November 1993

TOPIC -----

How do I avoid scratching the Newton MessagePad's touchpad?

DISCUSSION -----

The Newton MessagePad's touchpad (or screen) can be scratched quite easily. Here are some useful tips you can use to avoid scratching the touchpad.

- Only use the pen that was included with the Newton or other plastic-tipped pens designed for use with touch-sensitive screens, on the Newton's touchpad.
- Only clean the touchpad with a clean, soft, dry cloth. A chamois cloth works well.
- Do NOT use any solvent or cleaner on your Newton's touchpad!
- Clean your Newton's touchpad and pen often.
- Cover the touchpad when you're not using it to avoid the buildup of dust.
- If the touchpad has been exposed to dust for any length of time, clean it and your pen before writing.
- If, while writing, you discover that the pen seems to 'feel' different, IMMEDIATELY stop writing and clean both the touchpad and the pen. Debris on either device can cause the pen to 'feel' different when writing and scratch the touchpad.

Newton 1 MB Storage Card: How to Replace the Battery (1/97)

Revised: 1/24/97
Security: Everyone

Newton 1 MB Storage Card: How to Replace the Battery (1/97)

==========

Article Created: 15 November 1993
Article Reviewed/Updated: 24 January 1997

TOPIC ----------

How do I change my Apple MessagePad devices 1 MB SRAM Storage Card's backup battery without losing the card’s contents?

DISCUSSION ----------

As a Static RAM card, the 1 MB card requires a battery to maintain the contents when it is not installed in Newton. Storage cards that use batteries should have their battery life closely monitored and should have their batteries replaced approximately once a year. The Newton hardware warns you if the battery needs replacement. Apple 2MB Flash Storage Card and 4MB Flash Storage Cards use Flash memory technology, which does not need batteries to preserve memory.

Apple originally shipped the 1 MB card with a 3-volt Duracell DL 2325 lithium disk battery. This battery is no longer made by Duracell. The equivlant battery is Panasonic and Rayovac BR-2325.

If possible, leave the 1 MB card inside your Newton to maintain contents when replacing the battery. If you replace the backup battery with outside the Newton, replace the battery in 10 minutes or you may cause data loss.

To replace your storage card's battery, follow these steps:

1) Slide the switch on the top edge of the card into the unlocked position.

2) On the top edge of the card, you'll find a small slot.Using acoin or a fingernail for leverage in the slot, pull the battery carriage out of the card.

3) Place the battery in the carriage slot, making sure the plus (+) side is facing up. Wipe your fingerprints from the surface of the battery.

4) Gently push the carriage back into the slot until you hear a small click.

Article Change History:
24 Jan 1997 - Added current battery information.
18 Jun 1996 - Added battery type information.

Newton MessagePad: Separating Imported Name File Data (11/93)

Revised: 11/15/93
Security: Everyone

Newton MessagePad: Separating Imported Name File Data (11/93)

==========

Article Created: 4 November 1993

TOPIC -----

When I import data from my Sharp Wizard OZ/IQ 9600 to my Newton MessagePad, a single field in my Names application receives ALL of the imported data.

How can I separate this data string without losing any of the data?

DISCUSSION -----

There are three different methods to separate your data. One method uses the Newton Connection Kit, while the other two methods use the MessagePad's clipboard.

If you own the Newton Connection Kit, follow these steps:

1) Synchronize your data with your Macintosh or MS-DOS/Windows-compatible computer.

2) Copy and paste individual pieces of the string to their appropriate fields using your computer.

3) Save all files and re-synchronize after you've finished copying your data.

If you do not own the Newton Connection Kit Software, you can use the MessagePad's clipboard to separate data. Here is the first method:

1) Select the first piece of information from the combined data string.

2) Drag the selected piece of data to the upper-right corner of the MessagePad screen.

3) Expand the field that you wish to place your data into by tapping on it.

4) Drag your data from the clipboard into the expanded field.

5) Repeat the process for the remainder of the string.

The other method is to:

1) Select the entire data string and drag it to the upper-right corner of the MessagePad's screen.

2) Open the Note Pad application and drag the data string into the Note Pad.

3) Divide the data string into its appropriate items.

4) Select each data item and drag them to the upper-right corner of the screen.

5) Move each data item back into the appropriate field in the Names file.

Newton Fax Modem Card: Description (11/93)

Revised: 11/15/93
Security: Everyone

Newton Fax Modem Card: Description (11/93)

==========

Article Created: 15 November 1993

TOPIC ----------

This article describes the Newton Fax Modem Card.

DISCUSSION ----------

The Newton Fax Modem Card is a PCMCIA-based data/fax modem. It has all the features and functionality of the external Newton Fax Modem, but is built into a type II PCMCIA card.

The Newton Fax Modem Card communicates data at 2400 bits per second and sends faxes at 9600 bits per second. It's compatible with the Hayes AT command set, Group 3 fax standard, MNP 2 and 4 error correction, and V.42bis and MNP 5 data compression.

The Newton Fax Modem Card can be inserted into the Newton MessagePad and allows users to send faxes or communicate via NewtonMail and other online services.

ARA 2.0: Third-Party Vendor Support (11/93)

Revised: 11/16/93
Security: Everyone

ARA 2.0: Third-Party Vendor Support (11/93)

==========

Article Created: 15 November 1993

TOPIC

This article provides information on Third-Party vendor support for Apple Remote Access product family.

DISCUSSION

More than 12 leading third-party vendors will be shipping products built upon the Apple Remote Access product family architecture. The Apple Remote Access product family architecture consists of the new AppleTalk Remote Access Protocol (ARAP) 2.0 and Application Programming Interfaces (APIs). Third-party vendors utilizing the Apple Remote Access product family architecture offer Apple Remote Access users a wide variety of solutions, enhancements and options.

The Apple Remote Access architecture empower third-party vendors to create a variety of service solutions including: the building of stand-alone remote access servers, security enhancements, and reporting applications.

To locate a vendor's address and phone number, use the vendor name as a search string.

Apple Remote Access Portability

Leading companies such as APT Communications, Inc.; Cayman Systems; Cisco Systems, Inc.; Computer Methods Corporation; FCR Software, Inc.; Global Village Communication, Inc.; Pacer Software, Inc.; Shiva Corporation; Telebit; Webster Computer Corporation; and Xylogics, Inc. have announced independent products that support ARAP 2.0. These companies are building server functionality into other devices such as: dial-in communication equipment, routers, bridges, print and file servers and other computer systems or stand alone products.

Integrated Security Solutions

Key security vendors such as Digital Pathways, Inc.; MicroFrame, Inc.; Open Computing Security Group (OCSG); and Security Dynamics, Inc. have announced Apple Remote Access security products. These security products augment the advanced security features already found in the Apple Remote Access MultiPort Server and adhere to recognized security standards such as Kerberos network access security, Digital Encryption Standard (DES) password scrambling, and other token and card-based systems. The security functionality is added by the vendors through the Apple Remote Access security architecture which includes a Client and Server Security Application Programming Interface (API).

Reporting and Call Accounting

Additional third-party opportunities are available through the Apple Remote Access MultiPort Server logging system. They can incorporate the logging information into network management and resource allocation solutions. This information is readily available to any solution since it is stored as tab-delimited text. Examples of accessible information include: date and time of connections, disconnection, and connection-attempts events. Other available information includes user IDs, optional accounting and charge back identification information.

Remote Access Client Interfaces

Third-parties can also hook their applications directly into the Apple Remote Access Client through the architecture's API for the customization of commercial and in-house applications. This allows third-party applications to dial-out and make connections transparently to remote networks without the users knowledge or training of Apple Remote Access Client software. Examples of companies developing these kinds of products include Farallon Computing, Inc. and No Hands Software.

Modem and Terminal Adapter Support

While Apple has included automated modem scripts in it's new products for most of the leading modem and ISDN terminal adapter companies, it has also created the Apple Remote Modem Access Scripting Guide and the Modem Workshop Software, which allows modem vendors, in-house developers, and other technical users to write scripts for their particular modems, terminal adapters or PBX systems.

Apple Remote Access Architecture Products and Availability

The Apple Remote Access architecture consist of the enhanced AppleTalk Remote Access Protocol (ARAP) 2.0 specification and Application Programming Interfaces (APIs). The ARAP 2.0 specification provides the necessary interfaces for building compliant servers. The APIs include the security and client application interfaces. The protocol specifications and APIs are available in the AppleTalk Remote Access Protocol Developers Kit V.2.0. The Modem Scripting Guide and Modem Workshop software are available in the AppleTalk Remote Access Modem Tool Kit V.2.0. Each of these tool kits are available from APDA, Apple's source for developer tools.

Apple Remote Access General Q&A (11/93)

Revised: 11/16/93
Security: Everyone

Apple Remote Access General Q&A (11/93)

==========

Article Created: 15 November 1993

TOPIC -----

This article contains general questions and answers on Apple Remote Access for Macintosh.

DISCUSSION -----

Q) What is Apple announcing at Comdex in regards to remote access?
A) Apple is introducing a new family of remote access products. The new Apple Remote Access product family allows individuals and workgroups of any size to easily access information and services remotely over a variety of connections, ranging from standard telephone lines to ISDN.

Q) What are the new products?
A) The new product family includes the Apple Remote Access MultiPort Server, Apple Remote Access Personal Server for Macintosh and Apple Remote Access Client for Macintosh. The product family also includes several associated remote access products, including the Apple Remote Access MultiPort Server X.25 Extension Kit, the Apple Remote Access Client for Macintosh 10-Pack, Apple Remote Access Client for Macintosh Upgrade Kit and the Apple Remote Access Personal Server for Macintosh Upgrade Kit.

Q) What is the difference between these products?
A) Each product in the family is designed to provide a solution for different customer needs. The Apple Remote Access MultiPort Server is a multiline solution offering the most versatile and secure way to provide remote network access for a large number of dial-in users. The Apple Remote Access Personal Server for Macintosh is a single-line all-in-one remote access solution providing the easiest and most affordable way to offer remote network information and resources for individuals and small organizations. Apple Remote Access Client for Macintosh is the best way to connect to remote network services—anytime, anywhere, and with any Apple Remote Access-compatible server, including Apple's MultiPort and

Personal Server products.

Q) What are the specific differences between AppleTalk Remote Access version 1.0 and Apple Remote Access Personal Server?

A) The major differences lie in two areas: product positioning and client-side features. Apple's original offering targeted anyone who needed remote access to an AppleTalk network.. Now that we have a product family, the positioning for Apple Remote Access Personal Server has become more specific: It provides a single-line solution for individuals and small workgroups that have relatively low-volume remote access needs. Apple's feature enhancements were to the "client side" Apple Remote Access Client for Macintosh. Those features include:

- DialAssist™ technology (this is a big addition)
- Complete new set (broader range) of supported modems
- Ignore dial tone option for non-standard telephone equipment
- Alternate connection support (Cellular, ISDN, X.25, etc.)
- Manual and automatic dialing options give you more flexibility when using more obscure telephone systems
- Original and alternate number redialing options
- Settable connection reminder via menu or dialog box
- Universally available disconnect via the "Remote Access Disconnect" Desk Accessory
- 1.0 and 2.0 Remote Access Server Compatibility
- User initiated change password option
- Built-in support for third-party external security modules

Q) How does the MultiPort Server differ from the Apple Remote Access Personal Server?

A) The Apple Remote Access Personal Server answers only one call at a time and is designed for individuals or small workgroups who want a very affordable, no fuss, all-in-one remote access solution. The Apple Remote Access MultiPort Server, on the other hand, provides multiple users simultaneous dial-in access through a single Macintosh computer-based server. The MultiPort Server is also targeted at workgroups which expect to have "high volume" dial-in usage.

Apple Remote Access Technology Q&A (11/93)

Revised: 11/16/93
Security: Everyone

Apple Remote Access Technology Q&A (11/93)

==========

Article Created: 15 November 1993

TOPIC -----

This article contains technology questions and answers on Apple Remote Access for Macintosh.

DISCUSSION -----

Q) What is Apple Remote Access and what does it do?
A) Apple Remote Access is a remote node technology (that is; allowing you to be a full peer on the network) which enables users to access all network resources, including file servers, electronic mail, calendars, applications, and network printers, from a remote location. Users of remote access include business travelers who need to check their electronic mail system back at the office or a person who telecommutes; working at home, yet needing to be "connected" back to the office.

Q) Is there a limit to the distance possible for a remote connection?
A) There is no physical limit. Users can call to and from anywhere in the world as long as they have access to a phone and a modem. The quality of the connection (that is: noise on the line) is the only factor that has an effect on the remote connection.

Q) Can Apple Remote Access products function over other connections such as ISDN or X.25?
A) Yes. The Apple Remote Access Client for Macintosh and MultiPort Server products have both been designed to accommodate a variety of connection options , including X.25 or ISDN services. Currently, Apple offers an Apple Remote Access MultiPort Server X.25 Extension which adds X.25 support to the Apple Remote Access MultiPort Sever and Client for Macintosh. Other connection options, such as ISDN, are expected to be offered by third-party developers.

Q) Why did Apple drop the "Talk" from the Apple Remote Access product name?
A) When AppleTalk Remote Access was first introduced in October 1991, it

was intended for use with AppleTalk networks only. AppleTalk is Apple's local area network protocol suite that is built into every Macintosh computer and networked LaserWriter printer. Because we recognize the growing demand for remote access solutions that include computers from a variety of vendors, we plan to introduce cross-platform capability for Apple Remote Access in the future. Apple Remote Access will run on computer systems other than the Macintosh computer, and consequently, LAN protocol suites other than AppleTalk. Thus, we dropped "Talk" from the name to parallel our new direction for Apple Remote Access.

Apple Remote Access Client For Macintosh Q&A (11/93)

Revised: 11/16/93
Security: Everyone

Apple Remote Access Client For Macintosh Q&A (11/93)

==========

Article Created: 15 November 1993

TOPIC -----

This article contains questions and answers on Apple Remote Access Client for Macintosh.

DISCUSSION -----

Q) What does the Apple Remote Access Client for Macintosh do?
A) The Apple Remote Access Client for Macintosh software allows users to connect to any Apple Remote Access-compatible server -- easily, flexibly, and productively. It can be used with the single-line Apple Remote Access Personal Server to support a small workgroup or with the multiline Apple Remote Access MultiPort Server to support larger numbers of remote or mobile users.

Q) What are the key benefits of the Apple Remote Access Client for Macintosh?
A) Key advantages include:
- Easy to use software gets you up and running fast
- Access information anytime, anywhere
- Connects to any Apple Remote Access—compatible server
- DialAssist technology makes dialing back to the office effortless

Q) Who will use the Apple Remote Access Client for Macintosh?
A: Apple Remote Access Client for Macintosh software will be purchased by anyone who is looking to capitalize on the resources of an existing Apple Remote Access Personal Server or MultiPort Server. In addition, customers who purchase third-party Apple Remote Access-compatible solutions may require the Apple Remote Access client software.

Q) What other features does the "client side" have?
A) Client-side features include:
- DialAssist technology
- Complete new set of supported modems

- Ignore dial tone option for non-standard telephone equipment
- Alternate connection support (Cellular, ISDN, X.25, and so on)
- Manual and automatic dialing options give you more flexibility when using more obscure telephone systems
- Original and alternate number redialing options
- Settable connection reminder via menu or dialog box
- Universally available disconnect via the "Remote Access Disconnect" Desk Accessory
- 1.0 and 2.0 Remote Access server compatibility
  NOTE: Users will not be able to take advantage of all ARAP 2.0 features when connecting to ARA 1.0 servers. Also the client side of ARA 1.0 is not compatible with the ARA 2.0 servers.
- User initiated change password option
- Built-in support for third-party external security modules

Q) What is DialAssist?
A) DialAssist is a technology Apple developed and built-into the Apple Remote Access Client for Macintosh product which makes dialing back to the office network simple, even for international travelers. It lets you build dialing sequences that help mask the complexities of worldwide telephone system—so you can connect easily from anywhere in the world. For instance, if you're in the France and need to access remote information on your network in California. You can enter your current location information into DialAssist and it will automatically add the appropriate dialing sequences (for example, outside line from hotel, country code, credit card number, and so on) around the telephone number in your Apple Remote Access connection document.

Q) What are the system requirements?
A) To use Apple Remote Access Client for Macintosh, users must have a Macintosh Plus computer or later model with at least 4 megabytes of RAM, and a hard disk drive, running system software version 7.0 or later. They also need an Apple or other Hayes-compatible modem (2400 bps minimum; 9600 bps or higher recommended) and appropriate modem cable, if necessary.

Apple Remote Access and Client/Client/Server Q&A (11/93)

Revised: 11/16/93
Security: Everyone

Apple Remote Access and Client/Client/Server Q&A (11/93)

==========

Article Created: 15 November 1993

TOPIC -----

This article contains questions and answers about Apple Remote Access for Macintosh and the Client/Client/Server.

DISCUSSION -----

Q) What do you mean by client/client/server?
A) The rise of mobile computing devices such as laptop computers and Personal Digital Assistants (PDAs), means the client/server model needs to be extended to take into account information access from these remote clients. This concept embraces the belief that both the mobile and desktop, or hard-wired network client, need to be equal partners in information exchange across networks and between each other. Infrastructure, both networking and distributed applications, need to take into account the requirements of people who need to get data remotely and exchange this with their co-workers, whether they are in the same office or whether they are using a mobile device in another country.

Q) What evidence does Apple have to back up this strategy and definition?
A) Lots of evidence: work trends; the rise of mobile communications devices such as cellular phones, pagers, mobile FAXes, and laptop computers; and the huge interest in Personal Digital Assistants. All these as well as Apple's successful AppleTalk Remote Access product clearly indicate a trend. Information access needs to be ubiquitous.

A main way of doing business today is collaboration. These work trends show that if people are going to collaborate successfully, their computing devices must be designed and tuned to work collaboratively. This means that no matter what computing device you are using, or where, you should be able to exchange data with fellow workers, access information and generally provide users with the same experience you get using a desktop machine and hard-wired networks. It's clear that to be

truly useful, mobile clients cannot be regarded as second class computing devices.

Q) Client/Client/Server is not just an Apple phenomenon; it's also happening in the DOS/Windows world. What makes Apple believe it has better solutions?

A) The ability to provide integrated solutions across computing platforms, as well as Apple's proven track record in hiding machine and network complexities from users. Client/Client/Server is more than just an operating system issue, it's a question of the approach to computing various vendors take.

You need to see computing in a systems setting. PDA's do not lend themselves to desktop GUI metaphors because they are being used in different ways, mainly on-the-move (for example meetings) to capture information, rather than manipulating information like desktop systems. Similarly, the OS, networking, applications and information management metaphors across PDAs, servers and desktop systems need to be optimized and 'harmonized' so that the strengths of each computing device add to a total systems approach that makes it easy for the customer to do what they want to do.

Apple Remote Access: Compatibility Q&A (8/94)

Revised: 8/11/94
Security: Everyone

Apple Remote Access: Compatibility Q&A (8/94)

==========

Article Created: 15 November 1993
Article Reviewed/Updated: 11 August 1994

TOPIC -----

This article contains questions and answers about compatibility on Apple Remote Access for Macintosh (ARA).

DISCUSSION -----

Q) Are the new ARA products compatible with AppleTalk Remote Access 1.0?
A) The new ARA Client for Macintosh can be set for server compatibility with any product compatible with the AppleTalk Remote Access Protocol (ARAP), including AppleTalk Remote Access 1.0. However, because of the significant enhancements we've made to ARAP 2.0, the AppleTalk Remote Access 1.0 client does not support connecting into Apple's newest server products—the ARA Personal Server or MultiPort Server or any ARAP 2.0 server. Affordable upgrades are available to customers with AppleTalk Remote Access version 1.0 who want to upgrade to the new ARA Personal Server or Client for Macintosh.

Q) Does the ARA MultiPort Server have to run dedicated on a Macintosh or can it run with other services? What about the Personal Server?
A) No. Both the ARA MultiPort Server and Personal Server operate in the background allowing the Macintosh to be used for other foreground applications. For optimal performance, however, it is always best to run the ARA servers products alone.

Q) Can the ARA MultiPort Server and the Personal Server run concurrently with AppleShare? Apple Internet Router? File Sharing?
A) In order to run AppleShare Server software and Apple Internet Router Basic Connectivity Package concurrently with the ARA MultiPort Server you must use AppleShare Server software version 4.0.1 or greater and the Apple Internet Router Basic Connectivity Package version 3.0.1 or greater. System 7 File Sharing cannot run concurrently with the ARA MultiPort Server. The ARA Personal Server can run concurrently with

Macintosh File Sharing, AppleShare 3.0 and greater but cannot run concurrently with any version of the Apple Internet Router.

Q) Does the ARA MultiPort Server run on all Macintosh Systems? What about the Personal Server?
A) The ARA MultiPort Server runs on any System 7 capable Macintosh which can accommodate 12-inch NuBus cards. The current Serial NuBus card was tested in a Power Macintosh 6100 with ARA MultiPort Server 2.0.1 and is compatible. To get the Serial NuBus card to fit in the Power Macintosh 6100, or similar form factor computer (Centris or Quadra 610), it is necessary to remove the internal hard disk which is located in the left front bay. Obviously, this is not an ideal solution, but it is all that exists as of Aug. 1994. The Personal Server works on all System 7 capable Macintosh computers.

Q) Does the ARA MultiPort Server support the built-in serial ports?
A) No. The ARA MultiPort Server will only function over NuBus communication cards such as the ARA Serial Card for modem connections.

Article Change History:
11 Aug 1994 - Corrected answer to MultiPort Server running on all Macintosh Systems.
06 May 1994 - Made clarification for technical accuracy.

Apple Remote Access: Competitive Profile (11/93)

Revised: 11/16/93
Security: Everyone

Apple Remote Access: Competitive Profile (11/93)

==========

Article Created: 15 November 1993

TOPIC -----

Why should customers buy Apple's Remote Access solutions over other competitive solutions? Why should customers buy the Apple Remote Access MultiPort Server over other competitive products?

DISCUSSION -----

1) Ease of setup and use: Apple Remote Access products excel over the competition in terms of ease of setup, use and administration—reflecting Apple's well-known user-centered design principles.

2) Very scalable: The fact that Apple's remote access products are software-only solutions both protects customers' investment and allows for easy scalability: Customers can choose to move to a higher-performance system or expand their system to offer additional ports as needed. In contrast, competing dedicated hardware systems generally require customers to commit to a particular level of remote access support, so expansion necessitates purchase of an entire new system.

3) Wide Connectivity Options: The Apple Remote Access MultiPort Server can connect to any AppleTalk network (for example, LocalTalk, Ethernet, or Token Ring, and so on.), giving customers wider network connectivity options than is provided by competitive products.

4) Extremely Secure: The Apple Remote Access MultiPort Server includes the most comprehensive security offerings available. It is designed to allow administrators to augment its built-in security features with additional security modules. This allows administrators to choose the level of security best suited to their organization.

5) Variety of Solutions: Apple offers a family of products, which provide different solutions to meet the range of needs from the individual user

to workgroups of any size.

6) Integrated/Flexible Solutions: Apple is more than just a "remote access" provider and can offer customers a set of workgroup solutions, such as AppleShare, Apple Internet Router, AppleSearch, Apple Remote Access, PowerTalk, PowerShare, and the Apple Workgroup Servers. Since all of these services work together, customers do not need to dedicate a single system for each service. They can choose to consolidate one or more of Apple's services on a single Macintosh computer or Apple Workgroup Server to maximize their system investment.

7) Affordable: With competitively priced products and integrated workgroup services that have an overall lower cost-of-ownership than the competition, Apple Remote Access products are extremely cost-effective.

8) Market Leadership: Apple is considered a technology leader in the area of remote access and our new product family offering shows our continued commitment to maintain this technology leadership.

Apple Remote Access and Cross-Platform Support Q&A (11/93)

Revised: 11/16/93
Security: Everyone

Apple Remote Access and Cross-Platform Support Q&A (11/93)

==========

Article Created: 15 November 1993

TOPIC -----

This article contains questions and answers on Apple Remote Access and cross-platform support.

DISCUSSION -----

Q) Will Apple support multivendor networks within large organizations?
A) This initial release of the Apple Remote Access product family is designed for and to complement "Macintosh mostly" workgroups of any size. In future product releases, customers can expect to see support for multivendor environments with cross-platform client support (such as a remote access client for Windows), multiprotocol dial-in adoption and even more powerful expansion capabilities.

Q) Will Apple provide point-to-point protocol (PPP) support?
A) Yes. Apple recognizes the growing demand for remote access solutions that include computers from a variety of vendors. To that end, Apple earlier this year announced its intention to support PPP to ensure that a cross-platform protocol will be available in its remote access products. Apple intends to introduce PPP supported products in 1994. Apple's support for PPP will be designed to allow multiprotocol remote access to a variety of network types, such as IPX, TCP/IP and AppleTalk.

Q) What is PPP?
A) PPP is an Internet Engineering Task Force (IETF) standard (RFC 1331) for encapsulating data packets over a serial communications link. Transport of any specific network protocol—-such as AppleTalk, IPX or TCP/IP—-with PPP requires an additional higher-level protocol, known as a Network Control Protocol or NCP. AppleTalk over PPP (the NCP for AppleTalk) is already a publicly available IETF standard, detailed in RFC 1378.

Q) How does Apple's announcement about support for Point-to-Point Protocol (PPP) affect ARAP? Will support for PPP nullify ARAP?

A) No. PPP support will not nullify ARAP. ARAP, or AppleTalk Remote Access Protocol, is Apple's protocol for accessing AppleTalk networks remotely. This protocol will still be used by Macintosh computers accessing AppleTalk networks remotely. At the same time, supporting PPP will allow multiprotocol remote access to a variety of network types, such as IPX, TCP/IP and AppleTalk.

Q) What is ARAP?
A) AppleTalk Remote Access Protocol, or ARAP, is the protocol used for accessing AppleTalk networks remotely. ARAP was introduced in conjunction with AppleTalk Remote Access in 1991. Like all AppleTalk protocols, ARAP is an open protocol, and specifications are available for third-party developers. In its latest versions of the Apple Remote Access product family, the AppleTalk Remote Access Protocol has been enhanced to provide superior performance and configuration flexibility.

Q) Is Apple going to sell a Windows version of Apple Remote Access?
A) Apple has announced its intention to bring to market an Apple Remote Access Client for Windows in 1994.

Q) Will Apple Remote Access work with the Newton MessagePad?
A) Since AppleTalk is built-into every Newton, it is a logical extension to provide remote access services to Newton users with Apple's remote access products. However, we have nothing to announce at this time.

Q) Will Apple Remote Access products work with Apple's PowerPC?
A) Yes. Apple plans to produce versions of the Apple Remote Access product family, AppleShare file and print server software and AppleSearch and that will run on its PowerPC processor-based servers.

Q) Are there other companies that make Apple Remote Access compliant software?
A) Yes. Apple has announced that more than 12 leading third-party vendors will be shipping products built on the Apple Remote Access product family architecture. The Apple Remote Access product family architecture consists of the new AppleTalk Remote Access Protocol (ARAP) 2.0 and client and security Application Programming Interfaces (APIs). Third party vendors utilizing the Apple Remote Access product family architecture offer Apple Remote Access users a wide variety of solutions, enhancements and options, such as security enhancements and reporting applications.

Q) Are third-parties making products that are compatible with the AppleTalk Remote Access Protocol and Apple Remote Access Client for Macintosh?
A) Yes. It is Apple's understanding that several companies intend to build stand-alone remote access servers that will compete with Apple's Apple Remote Access product family.

Q) Are the Apple Remote Access products compatible with the Apple Workgroup Servers (AWS)?
A) Yes. The Apple Remote Access Personal Server does not require any special card and therefore runs on any Macintosh computer, including the Apple Workgroup Server 60 and 80. The Apple Remote Access MultiPort

Server is compatible with any NuBus equipped Macintosh server and the Apple Workgroup Server 80. Currently the Apple Remote Access MultiPort Server does not support the AWS 60 because it requires a 7" NuBus card and the Apple Remote Access Serial Card is 12 inches. However, Apple is planning to have a 7" version of its Apple Remote Access Serial Card in the early part of 1994 which will be compatible with the AWS 60. The Apple Remote Access MultiPort Server is currently designed to operate on Macintosh operating systems only, and consequently, does not run on the Apple Workgroup Server 95, which is based on A/UX, Apple's implementation of the UNIX operating system.

Apple Remote Access: MultiPort Server Q&A (5/96)

Revised: 5/30/96
Security: Everyone

Apple Remote Access: MultiPort Server Q&A (5/96)

==========

Article Created: 15 November 1993
Article Reviewed/Updated: 30 May 1996

TOPIC ----------

This article contains questions and answers about the Apple Remote Access MultiPort Server.

DISCUSSION ----------

Q) What is the Apple Remote Access MultiPort Server?
A) Apple Remote Access MultiPort Server software provides a simple, secure, and efficient way to offer multiline remote network access for large numbers of mobile professionals. Used in conjunction with one or more Apple Remote Access Serial Cards, Apple Remote Access MultiPort Server 4-Port Expansion Kits, and Apple RS-232 cables, the server software converts a single Macintosh computer into a server that can support from 4 to 16 simultaneous dial-up connections.

Q) Who will use the Apple Remote Access MultiPort Server?
A) The Apple Remote Access MultiPort Server is designed to meet the remote access needs of large workgroups who are more security conscientious, need more powerful systems management and desire broader expansion capabilities. Likely purchasers will be people whose job is to provide technical support services for organizations, such as IS managers, network managers, systems analysts, and workgroup administrators. In addition, independent consultants/systems integrators may be interested in this product as a component of a larger custom solution.

Q) What are the key features of the Apple Remote Access MultiPort Server?
A) Key features include:
- Easy to install and use
- "Multiline" scalable solution that can support up to 16 simultaneous connections
- Offers a comprehensive set of security features
- Powerful and comprehensive administrative capabilities.

Q) How many ports are included in the Apple Remote Access MultiPort Server?
A) The Apple Remote Access MultiPort Server includes four ports and is expandable to eight, 12 and 16 ports with the addition of 1, 2 or 3 Apple Remote Access MultiPort Server 4-Port Expansion Kit, respectively.

Q) Does the ARA MultiPort Server support the built-in serial ports?
A) No. The ARA MultiPort Server will only function over NuBus communication cards such as the ARA Serial Card for modem connections.

Q) What are the software licensing options for the MultiPort Server?
A) The Apple Remote Access MultiPort Server comes with a license to install Apple Remote Access MultiPort software on a single Macintosh and to install Apple Remote Access Client for Macintosh software on up to four systems. Additional Apple Remote Access Client for Macintosh software can be purchased as single packs or 10-packs. For 50 or more, the Apple Remote Access Client software can be volume licensed.

Q) What level of support does Apple offer for this product?
A) For U.S. customers, the Apple Remote Access MultiPort Server product includes lifetime, basic up and running support at no charge during regular business hours Monday through Friday. Additional support is available through the Interactive Voice Response System which offers a 24 hour common questions & answers line and is available 24 hours a day, 7 days a week by calling 1-800-SOS-APPL. For information about product support outside the U.S., contact the local Apple subsidiary or distributor.

Q) Will network administrators be able to monitor the MultiPort Server with SNMP network management consoles?
A) Since the Apple Remote Access MultiPort Server supports the Simple Network Management Protocol—an industry-standard network management protocol—network administrators can monitor the Apple Remote Access MultiPort Server from any SNMP-based console. However, the SNMP console must support the MIB for Apple's MultiPort Server.

Q) What makes the Apple Remote Access MultiPort Server so secure?
A) The Apple Remote Access MultiPort Server offers a host of sophisticated security features that allow administrators to maintain the integrity of the network. These features—such as password aging, location validation, and the ability to filter access to services—make it one of the most secure remote access servers available. And because its security architecture is supported by leading third-party security vendors, administrators can choose to augment the server's built-in security features with additional challenge-and-response or roving access security modules.

Q) What is challenge-and-response or roving access security ?
A) Challenge-and-response or roving access security uses credit card or palm-size computers, provided by companies, such as Security Dynamics or Digital Pathways. These cards or small computers generate random passwords or access codes that users must input to gain access to a remote network. Providing this type of "roving access" security enables

an additional level of security for Apple Remote Access users who are traveling and are unable to utilize the built-in call-back feature.

Q) What are the Operating requirements of the Apple Remote Access MultiPort Server?

A) Operating requirements include:

- A Macintosh computer with one or more NuBus slots and at least 5 MB of RAM (for configurations with more than four ports, additional memory is required, and a high-performance system is recommended)*
- Macintosh system software version 7.0 or later (version 7.1 or later recommended)
- A hard disk drive and an Apple SuperDrive floppy disk drive
- Apple Remote Access Serial Card and Apple RS-232 Cable (for each set of four ports)
- One or more Apple or other Hayes-compatible 9600 bps/V.32 or higher speed modems
- The dial-in client software must be the Apple Remote Access Client software version 2.0 or greater.

* Support for Macintosh computers that require 7-inch NuBus cards may not be available at this time; consult your authorized Apple reseller or representative.

Apple Remote Access Personal Server Q&A (11/93)

Revised: 11/16/93
Security: Everyone

Apple Remote Access Personal Server Q&A (11/93)

==========

Article Created: 15 November 1993

TOPIC ----------

This article contains questions and answers about the Apple Remote Access Personal Server.

DISCUSSION ----------

Q) What are the key features of the Apple Remote Access Personal Server for Macintosh?

A) Key features include:

- Ease of use
- "Single-line" all-in-one software solution
- Supports a variety of modems and networks
- Built-in security keeps information secure.

Q) What are the specific differences between AppleTalk Remote Access version 1.0 and Apple Remote Access Personal Server?

A) The major differences lie in two areas: product positioning and client-side features. Apple's original offering targeted anyone who needed remote access to an AppleTalk network. Now that we have a product family, the positioning for Apple Remote Access Personal Server has become more specific: It provides a single-line solution for individuals and small workgroups that have relatively low-volume remote access needs. Apple's feature enhancements were to the "client side" Apple Remote Access Client for Macintosh. Those features include:

- DialAssist technology (this is a big addition)
- Complete new set (broader range) of supported modems
- Ignore dial tone option for non-standard telephone equipment
- Alternate connection support (Cellular, ISDN, X.25, and so on)
- Manual and automatic dialing options give you more flexibility when using more obscure telephone systems
- Original and alternate number redialing options
- Settable connection reminder via menu or dialog box
- Universally available disconnect via the "Remote Access Disconnect"

Desk Accessory
- 1.0 and 2.0 Remote Access Server Compatibility, however the client side of ARA 1.0 is not compatible with the ARA 2.0 servers.
- User initiated change password option
- Built-in support for third-party external security modules

Q) Who will use the Apple Remote Access Personal Server?
A) The Apple Remote Access Personal Server makes it easy for even non-technical Macintosh users to get started with remote access computing. Because of its ease of setup and use--as well as its single-package convenience and low price--it's ideal for individuals with home offices, telecommuters, traveling professionals, salespeople, students, and small organizations.

Q) Can current users of AppleTalk Remote Access upgrade to Apple Remote Access Personal Server?
A) Yes. Plans call for upgrades to be available for users of the original AppleTalk Remote Access 1.0.

Q) Is there a difference between the client for the MultiPort Server and the Apple Remote Access Personal Server client?
A) No, they're the same. The only difference is that the Personal Server product has a integrated client for Macintosh built into the software so we can offer an "all-in-one" solution for individuals on the go. Other than that, anyone using an Apple Remote Access Client for Macintosh can dial into either server.

Q) What level of support does Apple offer for this product?
A) For U.S. customers, the Apple Remote Access Personal Server product includes lifetime, basic up and running support at no charge during regular business hours Monday through Friday. Additional support is available through the Interactive Voice Response System which offers a 24 hour common questions & answers line and is available 24 hours a day, 7 days a week by calling 1-800-SOS-APPL. For information about product support outside the U.S., contact the local Apple subsidiary or distributor.

Q) What are the system requirements?
A) To use Apple Remote Access Personal Server, users must have a Macintosh Plus computer or later model with at least 4 megabytes of RAM, and a hard disk drive, running system software version 7.0 or later. They also need an Apple or other Hayes-compatible modem (2400 baud minimum; 9600 bps or higher recommended) and appropriate modem cable, if necessary.

Q) How will this product be sold?
A) The Apple Remote Access Personal Server is available through all authorized Apple resellers and major mail order catalogs including the Apple catalog.

Q) Why would someone buy the Apple Remote Access Personal Server over a competitive product?
A) For the individual, the Apple Remote Access Personal Server solution is

unique in the industry. No other company offers an "all-in-one" peer-to-peer remote access software solution. If two Macintosh users (at their homes or at the different offices) just wanted to easily collaborate remotely, Apple offers the only solution for this.

For the small workgroup, no one can offer a solution as simple, eloquent or cost effective as Apple's. With the Apple Remote Access Personal Server software, a customer can have remote users dialing into their workgroup network in minutes without any costly and complex hardware to setup. If their needs every expand beyond the Apple Remote Access Personal Server, they can move up to the Apple Remote Access MultiPort Server without any disruption to their user community.

Apple Remote Access and The PowerBook Bundle Q&A (11/93)

Revised: 11/16/93
Security: Everyone

Apple Remote Access and The PowerBook Bundle Q&A (11/93)

==========

Article Created: 15 November 1993

TOPIC -----

This article contains questions and answers about Apple Remote Access Client being bundled with PowerBooks.

DISCUSSION -----

Q) Will the Apple Remote Access Client for Macintosh be bundled with the PowerBooks?
A) Yes. Apple has begun bundling the Apple Remote Access Client for Macintosh with new models of its PowerBook notebook computers in the U.S. As Apple introduces new PowerBook models, it will evaluate whether to include value-added software based on the needs of its target customers.

Q) Why isn't Apple bundling the remote access client outside the U.S.?
A) We expect many of Apple's market geographies outside the U.S. will bundle the Apple Remote Access Client for Macintosh, although this is a decision being made at the local level. At this time, Apple is only prepared to commit to bundling the remote access client in the U.S.

Q) What client version is currently being shipped with PowerBook computers? When will the newest version come bundled on PowerBook computers?
A) Apple is currently supplying remote access client version 1.0. Now that the latest client version is now shipping, Apple will begin to bundle the new Apple Remote Access Client for Macintosh onto its PowerBook computers. Affordable upgrades are available to customers with AppleTalk Remote Access version 1.0 who want to upgrade to the new Apple Remote Access Personal Server or Client for Macintosh.

Q) Will Apple Remote Access Personal Server come bundled with PowerBook systems?
A) No. Apple only intends to bundle the Apple Remote Access Client for Macintosh on PowerBook notebook computers in the U.S. The Apple Remote

Access Personal Server is sold separately for those individuals or organizations who need a single-line server solution.

Apple Remote Access and PowerTalk Q&A (11/93)

Revised: 11/16/93
Security: Everyone

Apple Remote Access and PowerTalk Q&A (11/93)

==========

Article Created: 15 November 1993

TOPIC -----

This article contains questions and answers on Apple Remote Access and PowerTalk.

DISCUSSION -----

Q) Will the new Apple Remote Access Client and Personal Server software work with Apple's PowerTalk Direct Dialup Mail?
A) Yes. The products can run concurrently.

Q) What is the relationship of PowerTalk Direct Dialup Mail and Apple Remote Access Client and Personal Server software?
A) PowerTalk Direct Dialup Mail is an application level service that includes Apple Remote Access technology. The Apple Remote Access product family is a remote node service—which can run concurrently with PowerTalk Direct Dialup—but provides broader access to a variety of applications and services while PowerTalk Direct Dialup Mail is specifically designed to allow PowerTalk users to exchange electronic mail and documents.

Q) Is PowerTalk Direct Dialup Software compatible with AppleTalk Remote Access version 1.0
A) No. Customers who want to run PowerTalk Direct Dialup software concurrently with remote access must upgrade to the latest version Apple Remote Access Personal Server software or Client for Macintosh software.

PowerTalk Key Chain: Resetting a Forgotten Password (10/95)

Revised: 10/20/95
Security: Everyone

PowerTalk Key Chain: Resetting a Forgotten Password (10/95)

==========

Article Created: 16 November 1993
Article Reviewed/Updated: 20 October 1995

TOPIC ----------

This article tells how to reset a PowerTalk password if a user forgets it.

DISCUSSION ----------

Follow these steps:

Step 1
Turn off collaboration services in the PowerTalk Setup control panel.

Step 2
Throw away the PowerTalk Setup Preferences file in the Preferences folder.

WARNING: All Key Chain, Preferred Personal Catalog, Mailbox Preferences, I'm at, and PMSAMs (Personal Message Access Modules) will be lost when you delete the PowerTalk Setup Preferences. Please make a note of your settings.

Step 3
Restart the computer.

Step 4
Turn on collaboration services in the PowerTalk Setup control panel.

Step 5
Restart the computer

Step 6
Double-click on the mailbox to redefine PowerTalk services.

Article Change History:
20 Oct 1995 - Included two additional steps.

19 Jan 1995 - Added words forgot and forget.
08 Dec 1994 - Provided more information on PowerTalk Setup Preferences.

ClarisWorks 2.0 & At Ease 2.x Bug (8/95)

Revised: 8/14/95
Security: Everyone

ClarisWorks 2.0 & At Ease 2.x Bug (8/95)

==========

Article Created: 16 November 1993
Article Reviewed/Updated: 14 August 1995

TOPIC----------

When accessing an item from the Apple Menu while using ClarisWorks 2.0 with At Ease 2.x installed, some documents do not print all their pages.

DISCUSSION----------

There is a known problem with ClarisWorks 2.0 and At Ease when printing a document. If you switch out of ClarisWorks by selecting an Apple Menu Item or switching to another application, and return to print, the document does not print properly. Approximately the first two-thirds of the page prints, cutting or clipping the text on the last one-third of the page.

A workaround is to save the document, close and reopen it, and then print it (without going to the Chooser). You can also select New View from the View menu, then print the new view.

At Ease 2.0.3 fixes this problem.

Article Change History:
14 Aug 1995 - Reviewed for technical accuracy.
07 Feb 1995 - Added keyword and updated the text.
11 Mar 1994 - Added problem information and the proposed fix information.

Newton Connection Kit for Windows: Description (11/93)

Revised: 11/16/93
Security: Everyone

Newton Connection Kit for Windows: Description (11/93)

==========

Article Created: 16 November 1993

TOPIC -----

This article describes the Newton Connection Kit for Windows.

DISCUSSION -----

With the Newton Connection Kit for Windows, you can connect your Newton to a Microsoft Windows-based personal computer (PC) and create, view, edit, back up and synchronize information created on the MessagePad.

Synchronization

The Connection Kit automatically synchronizes information between the Newton and the computer. The information is stored by files and includes both data and applications.

The information in the Windows-based PC can be viewed and edited, then downloaded back to the Newton. Templates are used to view and edit the information, so you can do text-intensive work with a keyboard and move it directly to your Newton.

Synchronization creates three files. One is the Windows-based PC's view of Newton's memory. An archive file keeps an accumulative copy of all files synchronized. A backup file keeps only those files which changed from the last synchronization.

Any files created during synchronization can be restored back into Newton.

Install Package

This option allows Newton applications (packages) to be downloaded from a Windows-based PC into the Newton. Newton software can be distributed on Microsoft Windows-standard floppy disks, installed on the computer and then downloaded. The packages can be removed just as easily, using the Newton

Memory preference button labeled "Remove Software."

Modem Software for AV Computers: Supports 14.4kbps. (11/93)

Revised: 11/17/93
Security: Everyone

Modem Software for AV Computers: Supports 14.4kbps. (11/93)

==========

Article Created: 17 November 1993

TOPIC ----------

When will the modem software for the AV machines be upgraded to 14.4 Kbps (Kilobits per second)?

DISCUSSION----------

At the time the manuals were written, Apple could only guarantee 9600, and that was put in the manuals. After that point, we were able to implement 14.4, so Apple does support 14.4 Kbps (Kilobits per second.)

Apple Monitors: Symptoms Associated w/EMF (5/95)

==========

Article Created: 17 November 1993
Article Reviewed/Updated: 5 May 1995

TOPIC ----------

I am having severe Extremely Low Level Magnetic Field (EMF) interference problems with Apple 14" AV Color Displays connected to Centris 660AV, Centris 650, and Macintosh LC III computers.

Symptom: continuous vertical undulating interference on the monitor.

DISCUSSION ----------

Apple monitors are no more susceptible to EMF than any other monitor on the market today. All monitors demonstrate symptoms associated with EMF if the source is of sufficient strength.

Here are a few possible solutions:

1. Check the AC power line for noise. Apple has seen instances where noisy power lines induced the exact symptom you describe.

2. Locate the source of the EMF and then shield the wall between the source and the equipment.

3. Rotate the position of the monitors slightly, this may decrease the effect of the EMF field.

4. Shield the monitors with special five sided mu metal shields. However, please note that this is a very expensive solution.

PowerBook 270c and StyleWriter II (6/94)

==========

Article Created: 2 December 1993
Article Reviewed/Updated: 20 Jun 1994

TOPIC ----------

I'm having trouble printing from a PowerBook 270c to a StyleWriter II. (It prints if the Dock is attached.)

DISCUSSION ----------

Here are the settings you need:

- AppleTalk must be inactive

  or

  Remote Only (or EtherTalk, if that's installed) must be selected in the Network control panel.

- The Modem Port must be selected in the StyleWriter II Chooser document. Press the "Setup" button and then say OK, even though you don't plan to "share" the printer.

- The PowerBook Setup control panel must be set to "Normal". The default setting is "Compatible"

At Ease 1.0 Commonly Asked Questions (2/95)

Revised: 3/27/95
Security: Everyone

At Ease 1.0 Commonly Asked Questions (2/95)

==========

Article Created: 17 November 1993
Article Reviewed/Updated: 16 February 1995

TOPIC ----------

This article presents commonly asked customer questions and answers relative to At Ease version 1.0.

DISCUSSION ----------

Question: When I try to launch an application from At Ease, it quits and takes me to the Finder. What's wrong?

Answer: Most likely you have an extension or INIT conflict. Check your Extensions and Control Panels folders for any non-Apple items and contact their manufacturers for update information. In particular, check for older versions of Virex or AutoDoubler.

Question: I forgot my password. What do I do?

Answer: Follow these steps:

Step 1
Start from a floppy disk such as Disk Tools.

Step 2
Open the System Folder on your hard drive.

Step 3
Open the Preferences folder.

Step 4
Drag At Ease Preferences to the Trash.

Step 5

Restart the computer.

Question: Why can't I save into a folder on a floppy disk?

Answer:
You have the "Require a floppy disk" option on. To turn it off:

Step 1
Open the At Ease control panel.

Step 2
Click "Set Up Documents...", and uncheck this option.

With this option set, some applications will allow saving into folders on floppy disks, and some won't.

Question: How can I use At Ease to keep my children from deleting my important information?

Answer: If your children have access to an application, they will be able to change all documents that application can read. You want to prevent them from using the application that has your important information.

To do this:

Step 1
Set a password in the At Ease control panel.

Step 2
Uncheck the "Add a button to At Ease" option in "Set Up Documents...", and only add the applications and documents to At Ease that you want your children to use.

Question: Is At Ease a security program?

Answer: No. It provides a minimal level of security designed to prevent accidental deletion of documents. If security is a major concern, you should purchase a third-party security package.

AWS 95 and TextEditor 1.3a1 (1/97)

Revised: 1/17/97
Security: Everyone

AWS 95 and TextEditor 1.3a1 (1/97)

==========

Article Created: 17 November 1993
Article Reviewed/Updated: 17 January 1997

TOPIC ----------

This article describes a problem found with TextEditor 1.2 and the Apple Workgroup Server (AWS) 95 that can cause a loss of data.

DISCUSSION ----------

When launched, TextEditor 1.2 is issuing a pbSetEOF with a value of zero on the file with a refnum of 1. Normally, this is not a problem since a file refnum of 1 is not used. However, when AppleShare Pro is running on the AWS 95, an extended fcb pool is used and a file refnum of 1 is available. In fact, the first file opened by an AFP client is assigned a file refnum of 1. If a file with a file refnum of 1 is open on the AWS 95 with write permissions, when TextEditor 1.2 is launched, the data fork of that file will be set to zero bytes in length. This would not be a problem if the data fork of that file is not used.

TextEditor 1.3a1 fixes this problem and is available on AppleLink. This new version will be included in the next release of the AWS 95 software. Please replace all copies of TextEditor on AWS 95 systems with this version.

TextEditor 1.3a1 is also available on Apple SW Updates areas on the Internet, CompuServe and America Online:

America Online - keyword: applecomputer

CompuServe - GO APLSUP

Internet -
Worldwide Web: <http://www.info.apple.com/swupdates>
ftp: <ftp://ftp.info.apple.com>

Anyone that has an AWS 95 should not use TextEditor 1.2 while AppleShare is running. They should use TextEditor 1.3a1.

Display Card 24AC: Description (6/95)

==========

Article Created: 16 November 1993
Article Reviewed/Updated: 28 June 1995

TOPIC ----------

This article describes the Display Card 24AC.

DISCUSSION ----------

The Macintosh Display Card 24AC is a 24-bit NuBus color/grayscale display card with QuickDraw acceleration.

Features

- Supports all of Apple's Macintosh-compatible color displays at 24-bit resolution (16.7 million colors) and grayscale monitors at 8-bit resolution (256 grayscales).
- QuickDraw Acceleration
- Compatible with all Quadra, Centris and Macintosh II family CPUs, PowerPC CPUs with an available NuBus slot, and the Apple Duo Dock.
- Meets 7 inch NuBus card standard
- Supports multiple scan VGA monitors (may require third-party adapter to connect)

NewtonMail: Description (11/93)

==========

Article Created: 17 November 1993

TOPIC ----------

This article describes the NewtonMail communications service.

DISCUSSION ----------

NewtonMail is an electronic communications service for Newton users which allows the exchange of text messages and Newton documents.

With NewtonMail, Newton users can exchange text messages with other Newton users and with users of these online services: CompuServe, America Online, MCI Mail, AppleLink, SprintMail, EasyLink, and other online services accessible via the Internet. NewtonMail also enables the electronic exchange of Newton information such as notepad messages (including graphics), business cards, and calendar appointments between subscribers.

The NewtonMail service will be available 24 hours a day, 7 days a week, except for regularly scheduled periods of maintenance. NewtonMail is expected to be accessible from locations around the world, providing convenient local access to global communications networks.

To use NewtonMail, you need a Newton device, a Newton Fax Modem, a phone line and a NewtonMail account.

At Ease 2.0 For Workgroups Save To Floppy (8/95)

Revised: 8/9/95
Security: Everyone

At Ease 2.0 For Workgroups Save To Floppy (8/95)

==========

Article Created: 9 November 1993
Article Reviewed/Updated: 9 August 1995

TOPIC -----

I'm using At Ease 2.0 for Workgroups at my school, and I want the students to ONLY be able to open and save from a floppy. I have set the control panel to require a floppy disk, but the students can still open and save files to the hard drive or floppy. Also there is no prompt to insert a floppy when creating a new document, or trying to open an existing one, what's wrong?

DISCUSSION -----

If you installed Norton's Directory Assistance II on your computer, what you describe can happen. It attempts to override the Finder and lets users open and save from other directories. Removal of Directory Assistance II or similar programs is necessary for At Ease to properly prohibit this from occurring.

Note: The same is true for other programs that access files without using standard file manager. They, too, will be able to view the disks contents without regard to At Ease security.

Connectix CPU Q&A (11/93)

Revised: 7/8/94
Security: Everyone

Connectix CPU Q&A (11/93)

==========

Article Created: 16 November 1993

TOPIC ----------

Below are the most common questions about CPU. You may refer customers, with these questions, to the CPU Troubleshooting document which is on the CPU disk or to Connectix directly (800-950-5880).

DISCUSSION ----------

Q) Sometimes when I startup my PowerBook, the startup sound plays twice. Why?
A) On PowerBooks that can switch from normal processor speed to 16MHz, CPU switches the processor speed automatically at sleep or restart depending upon whether or not the AC charger is plugged in. On most PowerBooks, you must restart to make the change in clock speed. At boot, CPU checks to see if the charger is connected, sets the PowerBook to boot at the desired clock speed (full speed when the charger is plugged in, 16MHz if not) and restarts the PowerBook if necessary. This is why the PowerBook startup sound is heard twice. Since PowerBook Duos are capable of dynamically switching clock speed, the "stutter-start" never occurs on these computers.

Q) Why doesn't the caps lock key work?
A) CPU allows you to modify the behavior of the caps lock key on the PowerBook's built-in keyboard. You can change caps lock so that it activates only if the shift or control key is held down, or disable caps lock altogether. You can configure this feature in the Extended Keys panel.

Q) Why does only one application show its windows at a time?
A) In order to help you avoid a cluttered desktop, CPU's AppManager can automatically hide an application's windows when it is in the background. If you want to temporarily see all of your applications' windows, select "Show All" from the System 7 Application Menu. You can turn this feature off by unchecking "Hide Background Apps" in

QuickConfigure mode or by unchecking "Hide Background Applications" in the AppManager panel in FineTune mode.

LaserWriter: Print Density Adjustment Utility (11/93)

Revised: 11/18/93
Security: Everyone

LaserWriter: Print Density Adjustment Utility (11/93)

==========

Article Created: 18 November 1993

TOPIC----------

The print density adjustments that are available on most of the LaserWriter printers do not seem to make much of a change in the toner density. Are there any other methods for altering the toner density in order to save toner when printing rough drafts?

DISCUSSION----------

The toner density adjustment on most of our LaserWriter products generate only slight visual changes. Depending on the type of documented being printed there may be no visible changes between the maximum and minimum density settings.

For more control over toner density there is a third-party product system extension called Toner Tuner™, from Working Software, Inc., that provides additional control of the toner density. Toner Tuner™ is a system extension that uses PostScript and QuickDraw commands to set the grayscale values for printed pages. The Toner Tuner™ software supports system 6 and 7, and all QuickDraw and PostScript based printers.

For more information search the Technical Information Library, using "Working Software, Inc." as search words.

Security: Everyone

Quadra 605, LC 475, Performa 475 476: Sound (11/93)

==========

Article Created: 18 November 1993

TOPIC ----------

This article provides details about the sound capabilities of the Performa 475, Performa 476, Macintosh LC 475, and Quadra 605 computers.

DISCUSSION ----------

The Performa 475 and 476, Macintosh LC 475, and Quadra 605 sound systems allow users to play back 8-bit stereo sound, and to record single-channel (mono) 8-bit sound input from a microphone or line input devices (for example, home stereo equipment) using a stereo adapter cable. The stereo adapter cable may be obtained separately.

The sound output jack is a stereo connector, stereo miniature phone jack, three conductor tip/ring/sleeve (TRS).

Note: The Apple PlainTalk Microphone, which is sold as a standalone product, is compatible with these systems. These products cannot use the older style low-level output microphone used on previous Macintosh models.

Apple Basic Color Monitor and Centris & Quadra Computers (11/93)

Revised: 11/18/93
Security: Everyone

Apple Basic Color Monitor and Centris & Quadra Computers (11/93)

==========

Article Created: 18 November 1993

TOPIC -----

I have a Macintosh Centris 610 and Apple Basic Color Monitor. I selected 800x600 in the options panel of the Monitors control panel. The screen is now completely black, and I can't even see or use the Finder. Restarting from Disk Tools doesn't help.

DISCUSSION -----

The Problem

With any of these computers -- Quadra 610, Centris 610, Quadra 660AV, Centris 660AV, Quadra 800, or Quadra 840AV -- is used with the Apple Basic Color Monitor, 1152x870 and 800x600 at two different hertz values are available in the options portion of the Monitors control panel. If any of these values are selected, the screen will turn black or a distorted image of the screen will appear.

What To Do

Zapping (resetting) PRAM, which resets the system to the default 640x480, is the only known fix.

PowerBook: Radius PowerView Discontinued 11/93

==========

Article Created: 16 November 1993

TOPIC --

The Radius PowerView External Display Interface has been discontinued. This will effect certain PowerBook users (see below.) Please do not refer callers to Radius for this product.

DISCUSSION --

PowerBook computers effected will be all models without video out capabilities, specifically the 100,140,170,145, and 145B PowerBook models.

CD Improperly Mastered: Cause Problems on Startup (3/94)

==========

Article Created: 18 November 1993
Article Reviewed/Updated: 21 March 1994

TOPIC ----------

If the Performa 550 or LC 520 unit is shut down incorrectly (that is, power switched off without using the Shut Down command) while a CD is loaded, the computer will behave strangely at start up.

Symptom/Solution: The screen will go grey and all you'll see is the cursor. If you use a paper clip to manually eject the caddy and restart the computer the problem is fixed.

DISCUSSION ----------

This problem occurs on any Apple CD unit (whether internal or external) if the CD-ROM is improperly mastered. However this problem is amplified in the CD 300 Plus because the drawer retracts on shutdown making the problem more likely.

Apple uses the signature in the boot blocks to determine if the CD has a driver. Those CDs which do not clear these blocks before mastering will attempt to be booted. Apple tested 127 CDs currently shipping and four were found to have problems. This problem is especially prevalent in the current Software Toolworks titles; San Diego Zoo Presents The Animals!, World Atlas, U.S. Atlas, and Space Shuttle.

Apple is working with CD manufacturers to ensure that future CDs will not have this problem.

Article Change History:
21 March 1994: Added CD 300 Plus information and Software Toolworks CD-ROM titles.

LC 475, Quadra 605, Performa 475 476: Serial Ports (11/93)

Revised: 11/19/93
Security: Everyone

LC 475, Quadra 605, Performa 475 476: Serial Ports (11/93)

==========

Article Created: 18 November 1993

TOPIC ----------

This article describes the two serial ports in the Macintosh LC 475, Quadra 605, Performa 475, and Performa 476.

DISCUSSION ----------

These four Macintosh models have two serial ports, one for a printer and one for a modem. They ports are not identical.

- The printer port uses the standard 8-pin mini-DIN socket.

- The modem port uses a 9-pin mini-DIN socket.

Both sockets accept 8-pin plugs, but only the modem port accepts a 9-pin plug. Pin 9 on the modem connector provides +5V power from the ADB power supply. An attached modem should draw no more than 100mA from that pin. The total current available for all devices connected to the +5V supply for the ADB and the modem port is 500mA.

LaserWriter Pro 810 and VAX Platform Questions (11/95)

Revised: 11/21/95
Security: Everyone

LaserWriter Pro 810 and VAX Platform Questions (11/95)

==========

Article Created: 18 November 1993
Article Reviewed/Updated: 21 November 1995

TOPIC ----------

I'm interested in purchasing a LaserWriter Pro 810 for use on my Ethernet network. I have a VAX and about 60 Macintosh computers, and I want to know some specifics about how the LaserWriter Pro 810 supports the Dec LAT protocol.

1) Does the LaserWriter Pro 810 support LNO3 VAX printer emulation?

2) Does the LaserWriter Pro 810 support the WPS VAX-based word processing system?

3) How do third-party products such as Alisa Systems software and PATHWORKS interface with the DEC LAT support on the LaserWriter Pro 810?

DISCUSSION ----------

1) No, the LaserWriter Pro 810 does not support LN03 printer emulation. LN03 uses Digital's own escape characters. However being a PostScript printer, the LaserWriter Pro 810 can be used in place of many other PostScript printers, including the Digital LN03R, the PostScript version of the LN03. For an application that does not use the PostScript language, the LaserWriter Pro 810 also supports HP LaserJet II emulation.

2) To print to the LaserWriter Pro 810, the output has to be PostScript of HP PCL 4 mode. If you use the LaserWriter Pro 810 with a product such as PATHWORKS, PATHWORKS components will convert VAX text files to PostScript so VAX/VMS users can print their files to the printer. I am not familiar with WPS word processing system, but if it can support PostScript or HP PCL 4 printer, it can print to the LaserWriter Pro 810.

3) If you have PATHWORKS, you just need to define the printer just like any other Apple PostScript printer, and PATHWORKS will set up a print queue to talk

to the printer via AppleTalk. Digital has informally tested PATHWORKS 1.2 with the LaserWriter Pro 810 and it worked fine. I would assume Alisa will work the same way.

Even if you don't have PATHWORKS or Alisa, you can still interface to the printer via LAT. This is done by setting up an application port in LATCP and start a queue using the /PROCESSOR=LATSYM. This procedure is fully documented in the Network Installation and Configuration Manual.

Personal LW NTR: Postscript and Setting Tray Defaults

Revised: 11/19/93
Security: Everyone

Personal LW NTR: Postscript and Setting Tray Defaults

==========

Article Created: 18 November 1993

TOPIC----------

I'm getting a PostScript error when trying to set the paper tray format in the A4 paper tray. I'm using a SUN Workstation with UNIX and a Personal LaserWriter NTR.

When I print documents from the A4 tray, the printer driver uses a "Letter" format and margins are different.

This is the PostScript code I'm using:

```
%! /str 60 string def statusdict begin 60
defaultmultipurposepapertraysize str cvs print job end ( ) print
statusdict begin 60 defaultmultipurposepapertraysize pop str cvs print
end servedict begin O exitserver statusdict begin a4 true
defaultmultipurposepapertraysize end
```

DISCUSSION ----------

The operators for returning and setting the default multipurpose tray paper size are spelled incorrectly in the "Personal LaserWriter NTR Printer Developer Note". The correct spellings, respectively, are:

   defaultmultipurposetraysize

   and

   setdefaultmultipurposetraysize

This PostScript code will print a page showing the default multipurpose tray paper size:

```
/Times-Roman findfont
15 scalefont
setfont
72 700 moveto
/str 20 string def
(Default multipurpose tray paper size:  ) show
statusdict begin
defaultmultipurposetraysize pop str cvs show
showpage
```

This PostScript code changes the default multipurpose tray paper size based on the values used for "NAME" and "BOOL":

```
serverdict begin 0 exitserver
statusdict begin
NAME BOOL setdefaultmultipurposetraysize
```

The allowable values for "NAME" are the standard device setup procedures:

```
   /letter
   /legal
   /a4
   /b5
```

The standard device setup procedures /lettersmall and /a4small are not allowed.

The "BOOL" parameter is included for compatibility with other PostScript printers. It specifies whether the paper is to be fed long edge first or short edge first. For all paper sizes on the Personal LaserWriter NTR, the value of "BOOL" must be true, meaning short edge first.

The following PostScript code changes the default multipurpose tray paper size to a4:

```
serverdict begin 0 exitserver
statusdict begin
/a4 true setdefaultmultipurposetraysize
```

Super ATM 3.6: Works Fine with Macintosh AV Computers (11/93)

Revised: 11/19/93
Security: Everyone

Super ATM 3.6: Works Fine with Macintosh AV Computers (11/93)

==========

Article Created: 18 November 1993

TOPIC ----------

I have problems using Adobe's Super ATM, version 3.5 on a Macintosh 660AV or 840AV. The scenario is as following :

- Adobe uses the Apple Installer to install SuperATM,
- at the end of the installation, you must reboot your Macintosh,
- the Macintosh reboots correctly, except that the system freezes with the clock mouse and the menu bar staying white.

Does the Hardware System Update 2.0.1 solve this problem? I've tried to install this extension after installation of Super ATM and it doesn't change anything.

DISCUSSION ----------

Apple just learned that Super ATM, version 3.6 works fine with the AV computers (660AV and 840AV). Upgrade to version 3.6 and there should be no more problems.

In regard to Hardware System Update 2.0.1, that release does not actually load anything on the AV computers. You can run it, but nothing will change. It would not have fixed the problem you were experiencing.

System 7.1 Overview (7/96)

Revised: 7/1/96
Security: Everyone

System 7.1 Overview (7/96)

==========

Article Created: 19 November 1993
Article Reviewed/Updated: 01 July 1996

TOPIC ----------

System 7.1 is the first "world ready" reference release of System 7. It combines functionality introduced since the debut of System 7.0 along with a number of enhancements which support multiple languages or scripts running on a single Macintosh computer at one time.

To users of System 7.0 and 7.0.1, there are a few changes in the core system software package that you need to be aware of. These enhancements are:

- 5 new control panels
- Fonts folder
- Disk First Aid 7.1
- System 7 Tune-Up v1.1.1 now part of System 7.1
- QuickTime 1.5 extension

Please Note: This article doesn't cover WorldScript.

DISCUSSION ----------

New Control Panels

- General Controls control panel
  The major change to the General Controls control panel is the icon. You can still change date and time values here as well as in the new Date & Time control panel.

- Date & Time control panel
  This new control panel allows you to change the values for current date and time, as well as allowing customization of the date and time formats.

  Clicking on the Date Formats… button brings up a dialog box which

allows shifting the display of weekday, month, day, and year.

Clicking on the Time Formats… button brings up the following dialog box which allows shifting the display of 12 or 24 hour clocks, the display of AM or PM suffixes, as well as placing leading zeros in front of the current hour:

- Numbers control panel
  This control panel allows you to set separators for large numbers as well as to set currency symbols.

- Text control panel
  This control panel is for use with WorldScript I and WorldScript II. It provides the ability to switch between languages installed on the system, thus picking a primary viewing and editing language.

- PowerBook control panel
  This control panel replaces the Portable control panel which came with System 7.0 and 7.0.1. It incorporates several new features for Battery Conservation. In addition, it provides SCSI Disk Mode for those PowerBooks capable of SCSI Disk Mode, as well as Automatic Wake-Up settings previously available in the Portable control panel.

  One slider bar gives the choice of "Maximum Performance" or "Maximum Conservation" to replace the twin slider bars for cycling off the hard disk and the screen.

Battery Conservation

Clicking the options button below the slider bar brings up a dialog box. This dialog box allows you to set the PowerBook to never sleep when it's plugged into an electrical outlet, as well as to turn the processor cycling feature on or off.

Fonts Folder

The Fonts folder is a special folder located within the System Folder, similar to other folders such as the Control Panels folder. The Fonts folder provides a common place for all bitmapped, TrueType, and Adobe Type 1 fonts to reside. You can also place font suitcases in this folder. During the startup process, the system opens up to 128 files containing bitmapped and TrueType fonts in the Fonts folder, and makes them available for use.

You can add and remove fonts from the Fonts folder while other applications are open. Fonts added to the Fonts Folder won't appear in already running applications.

However, you can't drop fonts onto the system suitcase in System 7.1. The system treats font files like normal files. Since the font files are always open, the Finder won't permit replacing a font file in the Fonts Folder with another file of the same name. You can merge font suitcases by dropping one onto another, and you can remove fonts from a suitcase.

Disk First Aid 7.1

Disk First Aid 7.1 now repairs the disappearing folders and files problem. However, to prevent the problem from re-emerging, please install System 7.1 or install System 7 Tune-Up v1.1.1 over System 7.0 or 7.0.1.

System 7 Tune-Up Rolled into System 7.1

System 7.1 includes the contents of the System 7 Tune-Up disk v1.1.1.

QuickTime 1.5 Included

The QuickTime 1.5 extension is included as a part of System 7.1.

Compatibility Issues

You need to update the following Apple software to work properly with System 7.1:

- AppleShare File Server 3.0 – update to AppleShare File Server 3.0.1.
- MacTCP 1.1 – update to MacTCP 1.1.1.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). PageMaker 5.0: Customers Needing LW Utility 7.4.1 (11/93)

Revised: 11/22/93
Security: Everyone

PageMaker 5.0: Customers Needing LW Utility 7.4.1 (11/93)

==========

Article Created: 22 November 1993

TOPIC ----------

Apple Support is getting calls from customers who have purchased PageMaker 5.0 and need the LaserWriter Utility 7.4.1. Aldus apparently has licensed LaserWriter 8.0 and has bundled it with PageMaker 5.0 but they did not license or bundle LaserWriter Utility 7.4.1.

DISCUSSION ----------

Apple Product Management and Aldus came up with a solution on handling the LW 8.1.1 and LW Utility situation.

- Both LW 8.1.1 and the LW Utility are posted on Compuserve and AOL in the Aldus folders.

- LW 8.1.1 and the LW Utility 7.4.1 are being added to PageMaker 5.0. Copies of PageMaker 5.0 with LW 8.1.1 and the LW Utility 7.4.1 should be on dealer's shelves around mid-January.

- Aldus will sell a software update kit with LW 8.1.1 and LW Utility to PageMaker 5.0 owners for $9.95. This should be available by early January.

- Aldus does not expect Apple to supply PageMaker 5.0 customers with LW 8.1.1 or LW Utility. Aldus will inform their customers about the above ways of getting LW 8.1.1 and the LW Utility.

Macintosh: Chinese and English on One System (11/93)

Revised: 12/1/93
Security: Everyone

Macintosh: Chinese and English on One System (11/93)

==========

Article Created: 19 November 1993
Article Reviewed/Updated: 30 November 1993

TOPIC ----------

1) I'm a teacher and I want to bring Chinese writing into the classroom. While in China, I bought Chinese System 7.1 and successfully installed the system on my PowerBook 100. I now have two System folders: US and Chinese. Can I consolidate the files into one System folder (such as control panels, extensions, etc.) or should I have to keep the systems separate and use System Picker to switch systems?

2) Alternatively, I own ChineseTalk II. Can I enable word processing in Chinese simply by eliminating Chinese System 7.1 and instead installing the fonts in the Apple Product, ChineseTalk II?

3) Finally, all instructions for Chinese System 7.1 and ChineseTalk II are in Chinese but are incomplete and confusing. Where can I find complete documentation in Chinese and English?

DISCUSSION ----------

You might be a prime candidate for the Chinese Language Kit, and not the fully localized Chinese System 7.1 purchased in China. By installing the Chinese Language Kit on a Macintosh running U.S. System 7.1, you retain the English Finder and menus, but are able to input Chinese characters when using Chinese and World Script compatible applications. The Installer consolidates all necessary files and resources into one System Folder; afterwards, choose your desired script from the menu that is to the right of the Balloon Help menu. The Chinese Language Kit was built with the WorldScript technologies developed with System 7.1.

Chinese System 7.1 ships with Roman fonts, but it has a Chinese language Finder and menus.

Apple does not recommend more than one System Folder on a startup volume,

requiring the use of utilities such as System Picker, or manually blessing/deblessing different System Folders.

Apple does not recommend the use of ChineseTalk II or any of its specific resources, files or fonts that accompanied it, as ChineseTalk II was a stopgap product between System 6.x and Chinese System 7.1.

Further, ChineseTalk II automatically added a thin space character to each Chinese character when non-Script Manager compatible applications are used. This resulted in unique (non-standard) fonts which:

- Increases document sizes by one-third.
- Increases transfer and printing times
- Causes problems when moving text between different applications

Both the Chinese Language Kit and Chinese System 7.1 use Chinese TrueType fonts and can use Roman (U.S.) fonts: simply drag them to the Fonts Folder.

The Chinese Language Kit documentation is in English and Chinese.

For further information on WorldScript in the Tech Info Library, use WorldScript as a search string.

Revised: 1/12/94
Security: Everyone

Refurbishment & Life Cycle: For LW Models (1/94)

==========

Article Created: 22 November 1993
Article Revised/Updated: 11 January 1994

TOPIC ----------

Are there refurbishment kits for Apple Laser printers? If not, is there a List of parts that are "recommended for replacement"?

Also, what is the expected life of these printers?

DISCUSSION ----------

The LaserWriter II engine is the only Apple printer that has a refurbishment kit.

LaserWriter II
• Refurbishment kit part number: 652-0597
• Minimum life expectancy is 3OOK pages.

Personal LaserWriter SC/NT/NTR/LS
• Has a life of 150K pages
• Recommended that the fuser be changed after 100K pages.

Select 300/310:
• Has a life of 150K pages or five years.
• Recommended that the fuser be changed after 100K pages.

Select 360:
• Has a life of 300K pages or five years.
• Recommended that the fuser be changed after 100K pages.

LaserWriter Pro 600/630:
• Has a life of 450K pages or five years.
• For that engine the following parts are recommended for replacement after 200K pages: Fuser Assembly
  Transfer Roller

MP Tray Pickup Rollers
MP Tray Guide Assembly
Cassette Pickup Rollers

Personal LaserWriter 320:
• Print engine life: Up to 8K pages monthly maximum recommended

Article Change HIstory:
11 January 1994 - Added LW II and PLW families

SNA•ps: Automating IND$FILE File Transfers (11/93)

Revised: 11/23/93
Security: Everyone

SNA•ps: Automating IND$FILE File Transfers (11/93)

==========

Article Created: 22 November 1993

TOPIC ----------

I'm looking for an automatically solution for doing file transfer with IND$FILE. SNA•ps 3270 can do file transfer with IND$FILE, but it can't do them automatically.

I want that the Macintosh to send or get a text file to or from the host at a certain hour automatically. For example, at 5:00 PM every day check the host with an IND$FILE file transfer Tool.

DISCUSSION ----------

You'll need a third party product such as QuicKeys to automate file transfers. Information on QuicKeys by CE Software, Inc. follows for your convenience.

QuicKeys 3.0

Business And Professional Software
Macro Generators
QuicKeys 3.0
Keyboard enhancer
Macintosh Plus or larger; hard disk drive.

QuicKeys allows assignment of commands or actions to keystrokes. The program can define key presses to run documents and programs, select menu items, run Fkeys, insert current date and/or time, execute more than a dozen mouse movements, insert text strings, perform click and drag sequences and perform combinations of these commands or actions — all with a key press. DialogKeys, a companion program, lets a user use key presses to "click-in" buttons, check boxes or radio buttons in dialog boxes. QuickAccess is the utility program specifically designed for QuicKeys to create, modify and combine sets of defined keystrokes. It will also install sets into QuicKeys and print keyboard templates for easy reference. $169

PowerBook 165, System Enabler, & Added Hard Drive (11/93)

Revised: 7/8/94
Security: Everyone

PowerBook 165, System Enabler, & Added Hard Drive (11/93)

==========

Article Created: 23 November 1993

TOPIC -----

I received a PowerBook 165 to be repaired containing an added internal 160MB hard drive. The user complained of an inoperative Global Village PowerPort Gold internal modem, which was confirmed. I installed the PowerPort Gold into another PowerBook 165 and the fax/modem worked normally. I then installed the PowerPort along with the 80MB hard drive from the working PowerBook into the one received from the user, and the users PowerBook worked properly. Why does the 80MB hard drive work, but not the 160MB hard drive? Is it an incompatibility with the fax/modem, or a defect in the 160MB hard drive?

DISCUSSION -----

The PowerBook 165 uses an updated System Enabler 131, version 1.0.3. This enabler, along with other System Software, is provided on the hard drive that comes with the PowerBook 165 we ship. If the internal hard drive is added later, the proper System Enabler may not be present. System disks from another PowerBook, including the System Hardware Updater 2.0, only contains version 1.0.2, you need version 1.0.3.

Attach Apple Adjustable Keyboard: Quadra 660AV/840AV (1/94)

Revised: 1/20/94
Security: Everyone

Attach Apple Adjustable Keyboard: Quadra 660AV/840AV (1/94)

==========

Article Created: 23 November 1993
Article Reviewed/Updated: 7 January 1994

TOPIC ----------

Customers that purchase the Adjustable Keyboard for the Quadra 660AV/840AV will not have full functionality of the keyboard. Currently during the "Happy Mac" process for Quadra 660AV/840AV systems we do not load the "Record Button" extension. Therefore, customers who plug in the keyboard out of the box will not be able to use the record button on the Adjustable Keyboard to record sounds.

Furthermore, customers will not be able to use the installer disk that is shipped with the Apple Adjustable Keyboard because some of the resources included on the Adjustable Keyboard Installer disk are older than what is currently being shipped with the Quadra 660AV/840AV systems. Customers will get a message saying "The software to be installed is older than the software on the currently selected system, this installation is not allowed." The only option for the customer is to quit the installation process.

DISCUSSION ----------

WORKAROUNDS:

In order for customers to take advantage of all of the features of the Apple Adjustable Keyboard they will need to do either one of two things:

Option 1

Use the "System Update 2.0.1" diskette to install the Adjustable Keyboard resources. The customer will need to do a "Customize" install and select the "Apple Adjustable Keyboard Update." This will also update the "Sound" control panel from v8.0 to v8.0.1.

Option 2

Drag copy the "Record Button" Extension to the "Extensions" folder of the Quadra 660AV/840AV. The file is located on the Adjustable Keyboard Installer diskette in a folder called "Keyboard Files."

NOTE: It is NOT necessary for AV customers without the Apple Adjustable Keyboard to run the "System Update 2.0.1" installer disk.

System 7 Finder Description (8/94)

Revised: 6/5/96
Security: Everyone

System 7 Finder Description (8/94)

==========

Article Created: 24 November 1993
Article Reviewed/Updated: 26 August 1994

TOPIC ----------

The Finder in system software version 7.0 or 7.0.1 is very similar to the System 6 MultiFinder. (Note that there's only one environment with System 7. It's called Finder, but it has the features of the old MultiFinder.)

DISCUSSION ----------

System 7 Finder additions and improvements are too numerous to mention here, so here's a short list to get you started.

Some New Features of System 7

- System Folder
  Items are organized into specific subfolders. Drag files onto the closed System Folder, and the System automatically installs them for you.

- Finder windows
  In List view, folders and subfolders are displayed hierarchically in a single window. Click the triangle to expand or collapse a folder's contents.

  Clicking the zoom box opens windows just wide enough to see all the contents. Windows scroll when you move items beyond the boundaries.

- Apple menu
  Just about anything can reside in this menu -- desk accessories, documents, applications, folders, aliases, control panel devices (cdevs), even AppleShare volumes.

  To put an item in the Apple menu, drag it into the Apple Menu Items

folder within the System Folder.

- Desk Accessories
  To install them under the Apple menu, drag the files onto the closed System Folder. They're put in the Apple Menu Items folder within the System Folder.

- Fonts
  Install them by dragging the files onto the System Folder. They're put in the System file.

- INITs and cdevs
  INITs are called extensions under System 7. Extensions reside in the Extensions folder within the System Folder; cdevs reside in the Control Panels folder within the System Folder.

- Trash
  The Trash functions as a folder. It doesn't empty, even after you shut down the computer. It only empties when you choose Empty Trash from the Special menu.

- Balloon help
  The Finder provides a form of interactive on-line help for you. Click the question mark icon at the far right of the menu bar. Choose Show Balloons from the menu. Move the cursor over a window, folder, document, or icon, and a pop-up balloon gives you information about that item.

Getting System Information

1) At the desktop, click the Apple menu. You'll see About This Macintosh... at the top of the menu.

2) Choose About This Macintosh... from the Apple menu.

The window that appears is similar to the About the Finder... window when you're running MultiFinder in System 6. It not only shows memory allocated to the System and Finder, but also to other programs loaded in RAM. (Note that you can scroll and move this window.) You always want to see some white space for applications on this graphic barometer.

To see the names of applications loaded into RAM, click the mini-icon at the far right of the menu bar. The application menu appears. The check mark shows which application you're currently running.

Switching Between Applications

MultiFinder lets you switch between applications in several ways:

- Choose the application name from the Application menu at the far right of the menu bar.

- Click the visible portion of another layer.

- Double-click an application icon (even if dimmed).

- Drag the icon of a document onto the icon of an application (provided the application supports the document's format).

Memory Allocation

As with System 6 , each application in System 7 gets its own memory allocation. Even so, sometimes you'll get a message that there isn't enough memory to run the program, or that the application has unexpectedly quit. You can fix this by changing the program's memory allocation. Here's how:

1) Quit the application (no need to do this if the application has unexpectedly quit).

2) At the Desktop, select the application icon.

3) Choose Get Info from the File menu (or press Command-I). The Get Info window appears.

4) Select the Current size box.

5) Type a new number in the box. Make sure the number you use isn't less than the Suggested size. It's best to increase the memory size by only 50K to 100K at a time. (You can always repeat the procedure if it isn't enough.)

6) Close the Get Info window.

You can now launch the application again. The application will get this new memory size until you change it.

Hints and Help

- If an extension doesn't work properly in the Extensions folder, try moving it to the root level of the System Folder.

- While in Finder windows, you can drag a marquee around several files to select them.

- You can navigate without the mouse by using the arrow keys or by typing the first few letters of the folder or file name.

- Choose Finder Shortcuts from the Balloon Help menu to get a list of keyboard equivalents for Finder operations.

Article Change History:
26 Aug 1994 - Updated for FAX/TIL/QRG maintenance.
21 Feb 1994 - Provided the text version as well as the binary file.

MacX Mapping DECwindows Keys To Macintosh Keyboard (11/93)

Revised: 11/30/93
Security: Everyone

MacX Mapping DECwindows Keys To Macintosh Keyboard (11/93)

==========

Article Created: 24 November 1993

TOPIC ----------

I'm using MacX 1.2 to connect to a VAX/VMS. When in VT100 editing mode on the VAX' X-client application, some keys don't work using the Macintosh extended keyboard. The top four keys "clear", "=", "/", and "*" on the numeric keypad are the ones I'm have trouble with. Here is an example or the key's functionality:

* deletes a line
Clear 4 goes to end of file
Clear/ is used to find something.

I also have VersaTerm-Pro, and with VersaTerm-Pro these keys work fine. Remote command is:

set display/create/transport=tcpip/node=s10222
Second line: /create/term/detatch

I hope this information is sufficient to diagnose the problem and tell me what is wrong.

DISCUSSION ----------

This is not a MacX problem. DECwindows applications may have features that require keys not available on Macintosh keyboards. The keys you are talking about are the top row of the numeric keypad. In an editor such as EDT, these keys send the PFn keysyms and require special mapping. VersaTerm-Pro works fine because it is a terminal emulator that correctly sends the keysyms for these numeric keypad keys.

Page 17 of the PATHWORKS MacX User's Guide discussed this keyboard mapping using a VAX/VMS application called MSAX$MODMAP. MSAX$MODMAP modifies and displays mapping tables used by the X11 server to translate keystrokes to key symbols. A mapping table tells the X Window System -- in this case,

MacX -- how to translate the keystrokes. The term keysymbol (or keysym) refers to the individual location of a key as defined by the software. MacX captures the signals generated by the keys specified in the mapping table and translates them to key symbols that can be recognized by X11 client applications.

The remote command you used is fine. Once you are at the DECterm window and before you start EDT, you should run the following command to map the keyboard:

```
$ MCR MSAX$MODMAP MSA$EXAMPLES:MSAX$POSITIONAL_EXTENDED_KEYBOARD.DAT
```

You can choose to put this command in a command procedure to save typing.

I strongly suggest that you read about MacX keyboard mapping from the manual to understand the other options available.

Apple Internet Router 3.0 and X.25 Wide Area Extension (11/93)

Revised: 11/30/93
Security: Everyone

Apple Internet Router 3.0 and X.25 Wide Area Extension (11/93)

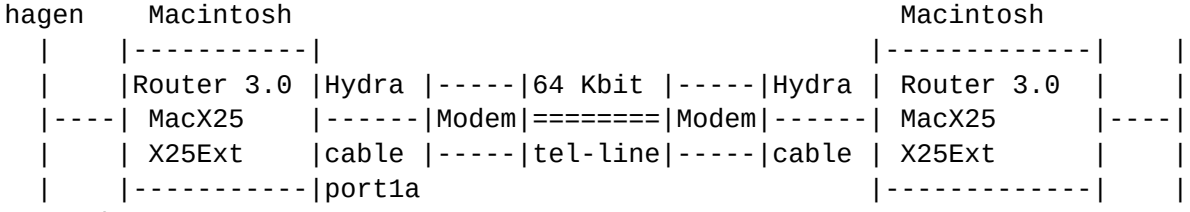
==========

Article Created: 24 November 1993

TOPIC ----------

I'm having trouble connecting two Apple Internet Routers, version 3.0, with the AppleTalk/X.25 Wide Area Extension, and MacX25 v1.2 using a 64 kbps line.

CONFIGURATION:



Parameter File	"Apple DCE"	"Apple DTE"
X.25 addr	2382XXXXXXXXX	2382XXXXXXXXX
MODE	Call	Answer

Question 1:

Is this configuration supported using a 64 kbps line between two Apple Internet Routers without a real X.25 network node in between?

Question 2:

Where should the calling address be configured?

I'm able to bring up level 1 and level 2, but virtual circuits are not being established because the packets do not contain the address of the origin (calling address).

I can easily configure the called/answered address in the PORT INFO window of the Internet Router Manager. By double-clicking on the X.25 (1) port access method, and in the field "Remote X.25 ID" to specify the X.25 address of the other Macintosh.

```
COPENHAGEN:  Call-mode      Remote X.25 := "2382XXXXXXXXX"  No password
Aarhus:      Answer-mode    Remote X.25 := "2382XXXXXXXXX"  No password
```

But I can't find a place to configure the calling/answering address (the address of the local Macintosh). I would expect it to be configured in MacX25 Admin, because the address is related to the allocated address of the Macintosh node on an X.25 network.

DISCUSSION ----------

The calling DTE address is the address that your computer uses to identify itself when initiating an X.25 call. Almost all public and private X.25 networks automatically insert this address in the call packet. However, if you are connected to a network that does not do this, such as yours, you need to use the Router Tuner utility to enter this address.

The Router Tuner is distributed in the AppleTalk Internet Router Administrator's Toolkit (RO490LL/A) by APDA.

Though we aren't familiar with your requirements, you may not need to use the AppleTalk/X.25 Wide Area Extension at all. A direct asynchronous or synchronous serial connect at 64 kbps would be substantially more efficient because it would not be burdened by the additional X.25 protocol overhead.

System 7.0 or 7.0.1 Installation (5/96)

Revised: 6/6/96
Security: Everyone

System 7.0 or 7.0.1 Installation (5/96)

==========

Article Created: 30 November 1993
Article Reviewed/Updated: 27 May 1996

TOPIC ----------

System 7.0 and 7.0.1 run on all Macintosh Plus and later Macintosh models that have 2 MB RAM (4 MB recommended) and a hard drive. However, some features are not available on all models. In addition, if you have a 68030 microprocessor or a 68020 microprocessor with a Paged Memory Management Unit (PMMU) installed, you can use the virtual memory feature.

DISCUSSION ----------

BACK UP YOUR HARD DISK

Copy the data on your hard disk to another hard disk or to floppy disks. There are several software utilities available that perform this operation. Or you can select the items you want to copy, and then drag them to the disk where you want to copy them. If you can't copy everything, at least copy your System Folder to another disk.

RUN COMPATIBILITY CHECKER

If you do not have HyperCard 2.1, copy the application and the Home Card to your hard disk before proceeding.

1) Copy the Compatibility Checker HyperCard stack to your hard disk.
2) Double-click the Compatibility Checker stack to open it. The Introduction screen appears.
3) Click the Start Checking button. Compatibility Checker scans your hard disk. Progress messages appear on your screen. If Compatibility Checker finds potentially incompatible items, a screen appears.
4) Click one of the two buttons at the bottom of the screen. If you click the Move Items button, a dialog box appears.
5) Click the OK button. Compatibility Checker's report screen appears.

6) Click one of the four buttons at the bottom of the screen. (It's best to print the report and use it as a guide to update your software if necessary.)
7) When you're finished with Compatibility Checker, click the Quit button. If you previously moved items out of your System Folder, a message appears.
8) Click the OK button.
9) Choose Restart from the Special menu.
10) Update your software according to the four categories outlined in the Compatibility Report:

- Compatible -- No action needed.
- Mostly compatible -- No action needed. It's optional to get the more recent version.
- Must upgrade -- You must upgrade to a compatible version to use this item with System 7.0 or 7.0.1.
- Not available -- No information available. Contact the software developer directly.

VIRUS AND SECURITY SOFTWARE

If you have installed virus protection or security software, you will need to remove them from the system. Follow removal instructions in the user manual provided with the software.

RUN DISK FIRST AID

Disk First Aid software can detect and repair problems on a hard disk.

1) Double-click on Disk First Aid, and make sure the startup disk is selected. If it isn't, click the Drive button to select the startup hard disk.

2) Click on Open and then on Start. Disk First Aid will check your hard disk for any potential problems. If it finds problems, you should let the software repair them.

3) Repeat this procedure for each hard disk attached to the system.

4) When you're finished verifying the hard disks, choose Quit from the File menu to return to the desktop.

If Disk First Aid can't repair a hard disk, you should back up the hard disk and reinitialize it using the appropriate formatting utility for that drive. For Apple drives, use Apple HD SC Setup.

UPDATE HARD DISK DRIVERS

If you do not have an Apple hard disk or use third-party software to format your disk, do not use the Apple HD SC Setup Utility. However, you should contact your

hard disk vendor to verify that your formatting software is compatible with system software version 7.0 or 7.0.1.

If you have an Apple hard drive, you should update the drivers with the version of Apple HD SC Setup that's on the Disk Tools disk, following these steps:

1) Double-click the HD SC Setup icon to launch it.

2) Click on the Update button.

3) When you're finished, click Quit to return to the desktop.

If HD SC Setup can't update the hard disk driver (indicated by a "dimmed" Update button), consider these possibilities:

- If a third-party utility formatted your hard disk, you should obtain the latest version of the utility to update your hard disk.

- If a version of Apple HD SC Setup more recent than the version on the Disk Tools disk formatted your hard disk, don't update the hard disk drivers.

- If an earlier version of Apple HD SC Setup formatted the drive, it may not have left enough room for the updated driver. You don't have to update hard disk drivers. However, if you intend to use file sharing or have a Macintosh that can use virtual memory, then you need to back up the disk and reinitialize it with HD SC Setup. This erases the disk, so be certain you back up the hard disk first.

- If the driver is corrupt, the Macintosh doesn't recognize the drive (that is, the disk doesn't show on the desktop). You may wish to reinitialize it with HD SC Setup. This erases the disk, so be certain you back up the hard disk first.

- If the driver has been modified with compression or security software you will not be able to update the driver. Contact the vendor for additional help.

INSTALLING SYSTEM SOFTWARE

System 7.0 and 7.0.1 software come as a set of 800K or high-density disks:

- The eight 800K disk set includes Disk Tools, Install 1, Install 2, Install 3, Printing, Fonts, Tidbits, and More Tidbits.

- The set of six 1.44MB high-density (or FDHD) disks includes Disk Tools, Install 1, Install 2, Printing, Fonts, and Tidbits.

1) Start up with the Install 1 disk. To do this, put the Install 1 disk in the startup floppy drive and turn on your Macintosh. A welcome message appears.

2) Click the OK button. The Easy Install screen appears.

At this point you have two options:

• Easy Install, which installs the Macintosh system software and printer software recommended for your computer

OR

• Customize Install, which lets you override the recommended software and choose exactly what to install.

Easy Install

1) Click the Switch Disk button to select the disk where you want to install system software.
2) Click the Install button to do the Easy Install.
3) Follow the instructions on the screen. Messages appear, prompting you for the proper disks. When installation finishes, a dialog box appears.
4) Click the Quit Button.
5) Choose Restart from the Special menu.

Customize Install

1) Click the Customize button.
2) Click the Switch Disk button to select the disk where you want to install system software.
3) Select the items you want to install. Shift-click to select multiple items. Your selections appear beneath the scrolling window.
4) When you've made your selections, click the Install button. Messages appear, prompting you for the proper disks. When installation finishes, a message appears.
5) Click the Quit button.

Net Install

If someone has previously set it up, you can install system software over a network:

1) Connect to the shared disk that contains the Net Install folder.
2) Open the Net Install folder. A window appears.
3) Double-click the Installer icon.
4) Follow the instructions under Easy Install or Customize Install, which appear earlier in this document.

IF INSTALLATION FAILS

If a normal installation fails, you need to do a clean system software installation. If you want to use the fonts installed in your old System file, you'll have to temporarily remove them. With versions of System 6, use Font/DA Mover to save fonts and desk accessories to a font suitcase.

1) Start up with the Disk Tools disk. To do this, shut down the

Macintosh, insert the Disk Tools disk into the floppy drive, then start up your Macintosh.

If the computer ejects the Disk Tools disk and won't start up from it, be sure you have an Apple SuperDrive (formerly called FDHD). If your computer doesn't have a SuperDrive, you need 800K disks. Call the Apple Order Center to get them.

The Tech Info Library article titled "Locating Vendor Information" can help you search for the Apple Order Center's phone number.

If you already have 800K disks, and your computer won't start up from the Disk Tools disk, you may have a computer that won't start from System 6. Use the Disk Tools disk that shipped with your Macintosh and continue with the following steps:

2) Double-click your hard disk icon to open it.
3) Double-click the System Folder to open it.
4) Create a new folder within the System Folder and name it "Old Finder."
5) Drag the Finder file within the System Folder to this new folder.
6) Restart your Macintosh. You should see a blinking question mark, indicating that the computer couldn't locate a valid System Folder on your hard disk.
7) Insert the first Install disk.
8) Reinstall system software following the instructions in the Install System Software section.
9) Reinstall the fonts you removed from the old System file. Drag the fonts to the System file.

INSTALL SYSTEM 7 TUNE-UP 1.1.1

Install System 7 Tune-Up 1.1.1 on all Macintosh systems running system software version 7.0 or 7.0.1. Before installing System 7 Tune-Up 1.1.1 on your Macintosh, read the entire Read Me file on the Tune-Up disk or the System 7 Tune-Up Version 1.1.1 Installation Instructions included in the Tune-Up 1.1.1 package.

To insure proper software installation, always install system, printer, or network software, including System 7 Tune-Up 1.1.1, via the Installer. Be sure to install the System 7 Tune-Up software last.

During System 7 Tune-Up installation, AppleTalk is set to "Inactive" in the Chooser. You need to set AppleTalk to "Active" in the Chooser, and restart your Macintosh. Then you can open the Network control panel avoiding the message that "AppleTalk Remote Access has not been properly installed."

The first time you start your computer with Extensions on with Tune Up 1.1.1 installed, the System 7 Tuner installs an INIT resource into the System file. You can only see this INIT resource with a tool like ResEdit. After that first installation, you can start up with Extensions off.

The INIT loads from the System file, but the System 7 Tuner must be in the

Extensions folder. If you throw away your system software and reinstall, you must start up with Extensions on with Tune-Up 1.1.1 installed.

System 7 Tune-Up 1.1.1 installs these files:

- System 7 Tuner 1.1 extension
- LaserWriter 7.1.1 driver
- StyleWriter 7.2.2 driver
- Chooser 7.1

HyperCard 2.2: File Type Menu Missing from Save a Copy Dialog

Revised: 5/3/95
Security: Everyone

HyperCard 2.2: File Type Menu Missing from Save a Copy Dialog

==========

Article Created: 29 November 1993
Article Reviewed/Updated: 3 May 1995

TOPIC ----------

With HyperCard 2.2, if the "StackToApp" extension is not in the proper place, the "Save a Copy" dialog doesn't include a pop-up menu for file type choice. Instead it displays "Stack" as static text.

DISCUSSION ----------

NOTE: StackToApp does not work on 68000 based Macintosh Computers such as the Macintosh Plus, SE, Classic and Portable. Also, StackToApp REQUIRES System 7.1 or later to function.

To use this feature, a system extension called "StackToApp" must be located in one of these places:

• Root folder where the HyperCard application resides.

• The Stack Translators folder in the same folder as the HyperCard 2.2 application, or

• The Extensions folder on the startup disk (NOTE: this is the least preferable location for the extension. If there is any extension conflict, and if the StackToApp extension is NOT in the Extensions Folder, then the user can boot with extensions off to isolate an extension conflict).

Article Change History:
03 May 1995 - Added additional requirement: only runs on System 7.1 or later.
11 Apr 1994 - Added that the root level was OK, and that Extensions folder should be the third choice.

Macintosh Portable: Used in Space Shuttle (11/93)

Revised: 12/1/93
Security: Everyone

Macintosh Portable: Used in Space Shuttle (11/93)

==========

Article Created: 1 December 1993

TOPIC ----------

I would like more information about the Macintosh Portable used in the space shuttle by the NASA some years ago.

DISCUSSION ----------

We believe you are referring to shuttle launch STS-43. The primary mission of STS-43 was to deploy a fourth TDRS satellite (Tracking and Data Relay Satellite). The shuttle was launched at 11:02 AM EST on Friday August 2, 1991, and landed at about 8:30 AM EST on Sunday August 11, 1991.

The shuttle carried a Macintosh Portable (nonbacklite) system on board. It was used for four primary purposes:

1) Testing four cursor control devices:
    a) the Portable’s built-in trackball
    b) a modified aircraft control stick fitted with a thumb ball at top
    c) a 2-inch trackball
    d) an optical mouse

Some bushings were placed under the trackball for experiment 1a to take up the small amount of slack. Experiments 1b-d were performed with third party products.

2) Connecting to AppleLink and sending mail and disk files. The very first electronic mail message from space was sent by the crew of the space shuttle mission on Friday, August 9, 1991. You may be interested in that message:

"Hello Earth ! Greetings from the STS-43 Crew. This is the first AppleLink from space. Having a __GREAT__ time, wish you were here,... send cry, and CS! Have a nice day..... Haste la vista, baby,... we'll be back!"

editor's note:
cry = cryogenics (meaning, send more fuel for life support--air, etc.)
CS = Reaction Control System (meaning, send more fuel for maneuvering/control) In other words, they wanted to stay up there!

To connect to AppleLink the modem was modified by NASA to work with their synchronous DCE equipment. AppleLink modifications were made to deal with, among other things, routing and packet delays.

3) Recording LB NP (lower body negative pressure) medical results along with other mission notes and provided procedures for doing medical experiments.

4) Shuttle flight path tracking using an application called (Shuttle Portable Computer). It presents a real-time display of the shuttle's orbital position against a world map along with day and night cycles, tracking stations, and emergency reentry information.

In addition, the Macintosh acted as an alarm clock (in tandem with the WristMac™) alerting the crew when it is time to do certain experiments, and so on.

Modifications were also made by NASA to the battery system (we believe a circuit breaker was added to meet the safety requirements and regulations for personal gear transported into space). Since this date, Apple portable computers are continued to be used in other NASA space missions; we have no details on those missions. MacWEEK published an article in late 1991 on mission STS-43 you may wish to pursue. In general, the Portable was basically a stock Macintosh with very few modifications.

Macintosh Screen Freeze, Lock Up: Resetting & Restarting (12/93)

Revised: 12/1/93
Security: Everyone

Macintosh Screen Freeze, Lock Up: Resetting & Restarting (12/93)

==========

Article Created: 1 December 1993

TOPIC ----------

My Performa 450 has locked up (screen is frozen) and I've heard that turning the power switch off and on is not the only way to restart my Macintosh. Are there any alternatives?

DISCUSSION ----------

There are several alternatives regardless of your Macintosh model. Try these in the following order:

1) If you have System 7.0 or later, attempt to "force quit" the application you were using. Hold down the Command (Apple), Option, and Escape keys. Your Macintosh should present a dialog box which states: "Force <application name> to quit? Unsaved changes will be lost." If you can move the mouse cursor, click the "Force Quit" button.

2) If the "force quit" is successful, you should return to the Finder. Restart your Macintosh from the Special menu. If the cursor is still frozen, refer to 3) and 4) below.

3) If your Macintosh is still locked up, (screen frozen) check and see if your Macintosh has a reset button. Most compact Macintosh models have a reset button (also known as a programmer's switch on the left or right side of the computer. Some modular Macintosh models have reset buttons on the front lower left hand side. (Examples are: Macintosh IIcx, IIci.) Push the button marked "reset."

4) If your Macintosh is still locked up, (screen frozen) and your Macintosh does not have a reset button, you can do a "warm restart." Hold down the Command, Option, and Power On Key (button at the very top of the keyboard). Your Macintosh should restart. This action is the equivalent of turning your computer off and then back on.

System 7: Personal File Sharing (8/96)

Revised: 8/9/96
Security: Everyone

System 7: Personal File Sharing (8/96)

==========

Article Created: 1 December 1993
Article Reviewed/Updated: 9 August 1996

TOPIC ----------

File sharing with System 7.0 and later versions turns your Macintosh into a file server, letting others access information on your hard disk. This article provides a general description of file sharing followed by the specific steps you follow to set up file sharing on your Macintosh. A brief list of troubleshooting tips follows the sharing setup steps.

DISCUSSION ----------

Defining File Sharing
==========

You can define file sharing in System 7 for up to 10 top-level items (drives and parent folders - folders inside folders don't count toward this limit). (This article uses the term "files" when a specific distinction is not important.)

You can define file sharing for a maximum of 100 users and a maximum of 100 groups in Users and Groups. Up to 10 users (specific or guest) can be connected, however 5 can be "actively" accessing files.

Setting up sharing includes these steps:

Turning file sharing on for your Macintosh
- Defining users and groups (if you want to restrict access)
- Defining the files you want to share
- Monitoring and managing file sharing once you have activated it

Setting Up Sharing

The first thing you need to do is turn sharing capability on for your Macintosh. To do this, select the Sharing Setup Control Panel. Enter the owner and system names, click on the Start button for File Sharing, and close the Control Panel.

Defining Users and Groups

To restrict access to your shared files you must define the users and groups who will have access. If no restriction is necessary, then you simply permit "guest" access.

You define users and groups using the Users & Groups Control Panel. This Control Panel initially includes two items: one for you, as the owner, and one for guest access.

To allow guest access, double click on the <guest> icon, which displays a small dialog box that gives you two options:

- Allow guests to connect
- Allow guest to link to programs on this Macintosh

Click on the options you want and then close the box.

To add additional users and groups, you select New User or New Group from the File menu. Both of these actions creates a new item in the Users & Groups folder.

If you create a New User, define the name as the name you want the user to use when accessing your shared files. To set specific access for the user, you double click on the user's icon, which displays a personalized dialog box.

You specify the type of file sharing access to have, whether they belong to a Group folder (described next), and whether they have program linking capability. You also define an access password, if desired.

If you create a New Group, define the name as the name of the group. You then select and drag the applicable user icon(s) into the group folder. If you double click on the group folder, you see the users who belong to the group.

Sharing Drives and Folders

You define the drives and folders you want to share by highlighting the item and selecting the Sharing option from the File menu. A file sharing dialog box displays. This dialog box lets you:

- Share this item and its contents
  For drives, this includes all files and top-level folders on the drive.
  For folders, this includes all files and sub-folders within the folder.
- Select who will have shared access
  You can change the Owner to someone other than yourself. You can also define access for a specific user or group. Or you can let everyone have access (as "guest").
- Define the level of access
  You can restrict access for each user or group to seeing folders, seeing files, and making changes, or any combination of these.
- Share access "down the folder tree"
  For folders, you can provide access to the folder and its immediate

contents, or to all folders within the selected folder (by selecting "Make all currently enclosed folders like this one").

- Restrict modification
  You can let users access information in your files and still restrict their ability to move, rename, or delete them (by selecting "Can't be moved, renamed or deleted").

Monitoring and Managing File Sharing

The File Sharing Monitor Control Panel lets you see what has been shared and shows you the name of any connected users (actually the names you have allowed users to connect with). In addition, the monitor lets you disconnect any connected users. A thermometer-style meter indicates the activity level of the server.

Viewing File Sharing Status

To see whether file sharing is turned on, simply open the File Sharing Monitor Control Panel. Information in the File Sharing Monitor updates as the status of file sharing on your Macintosh changes.

Disconnecting a File Sharing User

To disconnect a user from file sharing on your Macintosh, open the File Sharing Monitor Control Panel. Highlight the user or user names you want to disconnect and click on the Disconnect button. At the prompt, enter the number of minutes to wait before the disconnect (enter 0 for immediate disconnect) and click on OK.

A message announcing the pending disconnect displays on the monitor of each Macintosh that is currently sharing files on your system, or you can turn off your system to disconnect them all.

Steps For Setting Up File Sharing

Turn on File Sharing

1) Choose Control Panels from the Apple menu.

2) Double-click Sharing Setup in the Control Panels window.
   The Sharing Setup window opens.

3) Type your name in the Owner Name box. Your Macintosh uses this name to identify you over the network, like the Chooser name in versions of System 6.

4) Type a password you can remember, and that other users will not easily guess. (Upper case and lower case MUST match.)

   NOTE: With file sharing active, persons having access to your password can log on to your Macintosh and access the entire contents

of your hard disk.

5) Type a name for your Macintosh. The name you give your Macintosh becomes the file server name when file sharing is on.

6) Click the Start button on the File Sharing portion of the Sharing Setup window. The Start button changes to Cancel, and the Status window says that file sharing is starting up.

7) Close the Sharing Setup window.

Configure Guest Access
---
1) Choose Control Panels from the Apple menu.

2) Double-click the Users & Groups icon. The Users & Groups window opens.

NOTE: The window shows two users -- Guest, and the name you typed in the Sharing Setup Owner Name field.

3) Double-click the Guest icon. The Guest window opens.

Be certain that the box titled "Allow guests to connect" IS NOT checked, unless you are certain that you want to allow guest access.

4) Close the Guest window.

Create a New User
---
1) If the Users & Groups window is already open, skip to step 4.

2) Choose Control Panels from the Apple menu.

3) Double-click the Users & Groups control panel. The Users & Groups window opens.

4) Choose New User from the File menu. A New User is added to the Users & Groups window.

5) Click the mouse in the text area just below the New User icon. The cursor changes from an arrow to a text cursor, and an outline box appears around the text.

6) Type the appropriate user name.

7) Double-click the New User icon. The New User window opens.

8) Set the User's password by typing the password in the field titled User Password.

9) Set the User's privileges by clicking the mouse in the Allow User to Connect and/or Allow User to Change Password boxes.

10) Close the User's window.

Create a New Group
---

1) Open the Users & Groups control panel window.

2) Choose New Group from the File menu. A New Group is added to the Users & Groups window:

3) Click the mouse in the text area just below the New Group icon. The cursor changes from a pointer to a text cursor.

4) Type in the appropriate group name.

5) To add users to the group, select the User's icon and drag it onto the group until the Group's icon is highlighted. Release the User icon. The User is added to the Group.

6) To see the members of the group, double-click the Group icon. The Group window shows icons of all users who are members of the group.

Configure a Folder for Sharing
---

1) Create a folder for the files and folders you plan to share. The folder should contain files and folders to be shared with users with identical access privileges.

2) Select the items to share and drag them into the new folder. To share a copy rather than the original, hold down the Option key, select the item, and drag it to the folder. This creates a duplicate of the item(s) selected.

3) Click the folder you wish to share. The folder is highlighted.

4) Choose Sharing from the File menu. The Sharing window opens.

5) Click the box titled "Share this item and its contents."

6) Click the Everyone boxes to turn OFF access for guests.

7) If you wish to make the folder available to a group, click the User/Group pop-up menu.

8) Select the appropriate group and release the mouse button. The group you have selected should now be visible in the User/Group menu.

9) Close the folder's sharing window.

Troubleshooting Tips
==========

Here are the most common problems and the things you should verify first.

Users cannot see a shared volume or folder

- Make sure that File Sharing is turned on
- Make sure the volume or folder has the "Share this item..." box selected
- Check your network connections and make sure both you and the user have access to the same network

Users can't log on

- Make sure the user has the correct name and password (see Defining Users and Groups earlier in this article)
- Make sure the Caps Lock key is not down since passwords are case-sensitive
- Make sure the user has permission to connect (see Defining Users and Groups)
- Make sure the user has access to the same volume or folder that has been shared

Unexpected disconnects

- Make sure the Macintosh acting as a server has not gone down or been turned off
- Check for network problems

Cannot turn System 7 File Sharing on

- Make sure there is at least 340K of memory available on the hard disk.
- Make sure there are no DOS volumes mounted with PC Exchange. If there are, eject the volume and try again.
- Zap Parameter RAM (PRAM) by restarting the Macintosh and holding down the COMMAND-OPTION-P-R keys. Wait for the second startup chime then release the keys and let the computer startup. This resets the serial ports so you will have to reactivate AppleShare and reset your network interface (Ethernet or Token Ring) on most Macintosh computers.
- Delete the Users & Groups Data File in the Preferences folder. (NOTE: Deleting the Users & Groups Data File will remove all existing users and groups.) Restart the Macintosh and enter the Owner Name, Owner Password, and Macintosh Name in the Sharing Setup control panel then start File Sharing. Restart the computer and a new Users & Groups data file will be created. Recreate the user and group information.
- Delete the File Sharing folder in the Preferences folder, restart the Macintosh, and turn File Sharing on.
- If any media is formatted with a third-party utility, check with the vendor to be sure it is compatible with System 7 File Sharing.
- Delete the invisible AppleShare PDS file at the root of any volume being shared. (NOTE: Deleting the AppleShare PDS file will remove all existing file and folder access privileges.) Restart the Macintosh and start File Sharing. Re-establish folder and file access privileges. The AppleShare PDS file can be deleted by using ResEdit or other third-party utility that can view invisible files. Use the utility to make the file visible

on the desktop. The now visible AppleShare PDS file can now be dragged to the trash.

- Backup the data and reformat the drive. The issue may be caused by bad blocks on the drive.

This article is one of many available through the Apple Fax center. For a complete list of available fax documents, search the Tech Info Library for Apple Fax Document Index or call the Apple Fax line at 1-800-505-0171 and select document number 20000 (Apple Fax - Document Index - Product Support Literature). The Apple Fax center is available free of charge 24 hours a day, 7 days a week.

Macintosh TV: New Control Panel for HRC Cable (12/93)

Revised: 12/1/93
Security: Everyone

Macintosh TV: New Control Panel for HRC Cable (12/93)

==========

Article Created: 1 December 1993

TOPIC ----------

Macintosh TV users may find that they cannot receive television signals from their cable system. The solution is to get the revised TV Set Up control panel.

DISCUSSION ----------

Background

About 30 percent of the cable systems in the United States use Harmonically Related Carrier frequency, which is different from air-transmitted television signals and from the remaining 70 percent of cable systems. HRC reduces interference when many channels are transmitted over cable. Most television receivers that are labeled "cable-ready" are compatible with HRC.

Macintosh TV, however, cannot receive an HRC signal -- because each channel's frequency is shifted down by 1.25 MHz from the standard channel frequencies recognized by Macintosh TV.

Solution: A New Control Panel

A revised TV Set Up control panel that allows Macintosh TV to pick up the HRC frequency will be available starting November 30, 1993. Here's where to get it:

- From authorized Apple resellers (who may charge a downloading fee).

- From the Apple Assistance Center.

- From AppleLink. Here's the path:
  Software Sampler
  Apple SW Updates

Macintosh
Supplemental System Software
TV Setup (1.0.1).

This new control panel also fixes a problem that would sometimes cause the screen to darken after returning from TV mode.

Fonts and Desk Accessories Installation (7/96)

Revised: 7/1/96
Security: Everyone

Fonts and Desk Accessories Installation (7/96)

==========

Article Created: 1 December 1993
Article Reviewed/Updated: 01 July 1996

TOPIC ----------

This article tells you how to install fonts and desk accessories (DAs) for versions of System 6 and System 7.

DISCUSSION ----------

System 7 Installation
---

1) Close all open applications except the Finder.

2) When the System Folder is open, you must install fonts and desk accessories in their proper places within the System Folder. If you have a suitcase file of multiple fonts or DAs, and you don't want to install all of them, you must first double-click it to open the suitcase file. Select the fonts or DAs you want to install and install them as follows:

   • For versions of System 7 later than 7.1, drag the font files to the Fonts folder.

   • For versions of System 7 prior to 7.1, drag fonts onto the System file.

   • Drag desk accessories (DAs) to the Apple Menu Items folder.

   When the System Folder is closed, you can drag font files onto the System Folder icon, and the system places the fonts in the proper location.

System 7 Hints and Help

• DAs no longer have to reside only under the Apple menu. Instead of

the Apple menu, you can put them in folders or on the desktop.

- TrueType and fixed-size fonts (such as Helvetica 18) go in the System file for System 7 versions earlier than 7.1. They go in the Fonts folder for 7.1 and later versions.

- PostScript fonts go in the Extensions folder for System 7 versions earlier than 7.1. PostScript fonts go in the Fonts folder for 7.1 and later versions.

- For versions of System 7 earlier than 7.1, you may find your text prints incorrectly on a PostScript printer (like the LaserWriter NT or NTX). If this happens, put the PostScript fonts in the System Folder at the root level rather than in the Extensions folder within the System Folder.

System 6 Installation
---

1) Copy the Font/DA Mover 4.1 application to your hard disk.

   Note: If you have older versions of Font/DA Mover on your hard disk, drag them to the Trash. Using an older version can damage your System file!
